The Manner of Opening the Trees and Collecting the Sap.—By our experience in this particular (having for several years had upwards of three hundred trees, which are quite evenly distributed over about fifteen acres of ground, and opened each season), we are satisfied that no better way, or at least no plan more satisfactory, can be adopted than to tap each tree with two spiles, so arranging them that both flow into the same vessel. A three-quarter-inch auger is used for boring the trees, and the holes are made about one and a-half inches deep. The spiles, which are generally made from the largest sized specimens of the common elderbush that can be found, are properly pointed, and driven by means of a light mallet into these holes, about half an inch deep—two to each tree, as above suggested. In about two weeks after the trees are first opened the spiles should be drawn out and inserted in a new place, as a much larger quantity of sap can thus be obtained; but experience has taught us that this operation should not be repeated more than twice each season.

For gathering in the sap for boiling, we use a strong, light sled, drawn by a pair of horses, upon which is placed a cask capable of holding about one hundred and thirty gallons, having a circular hole cut in the top head just large enough to admit a common wooden bucket. With this we have no difficulty in collecting to the furnace all the sap which our trees afford during the sugar season, and that with but little labor.

Manner of Constructing the Furnace and Evaporating the Sap.—The style of furnace we use, and the kind which long experience has proved the most satisfactory, is built of dressed stone and made double, both departments terminating in one flue or chimney, and separated by a very light partition running lengthwise through the center. The hight of the chimney is equal to the length of the furnace, and the draft is regulated by a damper neatly fitted in it near its base, and operated by a handle extending to the outside. Eight cast-iron kettles, holding twenty gallons each, are placed in two rows in this furnace and thoroughly plastered about the tops with a good article of mortar, which prevents the possibility of any heat or smoke coming up around the boilers to disturb the operator in attendance. The quality or clearness of the sirup or sugar not being affected by keeping the kettles refilled as fast as they are lowered by boiling, we generally evaporate enough of sap at one time to make from seventy-five to one hundred pounds of sugar, or its equivalent in sirup; and, in order that evaporation be performed as rapidly as possible, the two boilers at the upper end of the furnace, or nearest the chimney, are used as heaters, being emptied into the others as fast as they come to the boiling point, and filled again with a fresh supply of sap. Much time and considerable fuel is saved by this method, since keeping each kettle filled with fresh sap very much retards the process of evaporation. After the plan by which this furnace is constructed, any farmer possessing a sugar orchard can build one just the size needed to hold the number of boilers required to evaporate the sap his trees produce, whether he have many or few.

Clarifying.—This being a very important process—one to which the sap, when it has been boiled down until it has become highly concentrated, must be subjected before it can be strained or filtered in a satisfactory manner—we will give our method, which, though simple, is quite sufficient for the business, and will most certainly prove, in any case, all that can be desired. When there has been enough of sap evaporated to make about fifty pounds of sugar—less quantities than this, of course, will require less clarifying material—take five fresh eggs, break them, and empty their contents into a half gallon cup, and with a spoon beat them up thoroughly, and then pour in water enough to fill the cup about half full; stir until well mixed, and empty into the kettles, putting an equal quantity in each. The kettles should then be allowed to boil very briskly for about fifteen or twenty minutes, by which time the impurities contained in the sap will all be collected together, and can be easily separated from it by straining.

The kind of strainer or filter we use is made from a piece of heavy new flannel, cut so that when sewed up it is conical in form and capable of holding about three gallons. To the top of this are sewed a couple of straps or handles, to hold it up by while straining, or to suspend it by to drip when the bulk of the fluid has passed through, which completes it.

Finishing Point.—It is somewhat difficult to give particular directions upon this subject. Many finish off their sirup or sugar in a kettle placed a short distance from the main furnace, while others complete the finishing process by the heat of the kitchen stove; but either of these methods are, in our estimation, very unsatisfactory, as it is almost impossible, in either case, to keep up a regular heat. The fire, at times flaming briskly, causes the kettle to foam up and perhaps run over, and then almost ceasing to burn at all, the foam immediately recedes, and thus, as the heat is increased or diminished, the contents of the kettle alternately rise and fall, which causes the sirup or sugar, when finished, to be dark in color and slightly scorched. We, years ago, adopted the plan of finishing off our sirup and sugar in the same furnace in which the sap was evaporated; and so great has been our success, we fully believe it to be a very superior method. The furnace being thoroughly heated by long continued boiling, but very little or no more fuel is required after the straining process has been gone through with, to finish the sirup or sugar—the immense bed of coals beneath the kettles, all glowing with heat, being generally all that is required for this work, furnishing, as they do, considerable, and a much more regular heat, than could otherwise be obtained.

When the sirup has attained the proper consistency, or is thick enough to take off, it should be dipped out into a tin or wooden vessel, and allowed to cool to some extent, when about five grains of pulverized alum may be added to each gallon, to prevent graining, which it sometimes does, especially if made very thick.

If sugar is to be made, the sirup should be very gradually reduced until the steam begins to escape from it in lively puffs, and the boiling mass assumes a glistening, or as some term it, a "sugary" appearance, when it may be considered done. It should now be lifted out into broad wooden bowls, where it may be stirred as it cools, and grained. Very little stirring must be done until the sugar has become tolerably cool, as continual stirring from the time it is first taken off until the process of graining is over, renders the grain entirely too fine. If it is to be run into cakes—the best plan, if the sugar is to be sold in the markets—it is better not to cook it quite so low as is necessary where it is granulated.

W. A. GRAHAM.

Flemingsburg, Ky., Jan., 1872.

ECONOMICAL NOTES.

Coal Ashes.—JOHN PINKHAM asks, "How can I utilize coal ashes?" We answer, by using them as absorbents in privy vaults, or for house slops, &c., and applying to the soil in such compost. They will deodorize a privy vault, if used daily, and make excrement portable; and if used in sufficient quantities, render its application to the soil after suitable mixing easy, safe, and convenient.

Feeding Oil Meal.—JOHN COCHRANE—We do not advise the feeding liberally of oil meal to an animal that is not used to eating it. It will not answer. It is a relaxing food and should be given in small quantities at first; and there should always be fed plenty of hay, straw or coarse fodder with it—as much of the latter as the animal will consume.

Steaming Hay for Cattle.—MILTON DARLING, Chemango, Co., N. Y., would like to know from men of experience if any thing is to be gained from steaming hay for cattle—and the amount of benefit derived from actual experiment.

Modes and Manners.

MINTWOOD'S CONVERSAZIONE.

Natural Wreaths for Ladies' Hair.—A Head Gardener, in Gardener's Magazine, says:—Those who recommend the old but useful *Euphorbia jacquiniflora* for dressing hair, are quite right, for it is one of the best subjects that could be grown for that purpose, provided a brilliant scarlet is required. We grow it by the dozen, especially for furnishing cut flowers for the dinner table, and so suitable is it for such purposes that it is really a matter for wonder it is not grown very extensively, instead of being met with in few places only. There is another plant to which attention may be profitably directed in common with natural wreaths, and that is *Astilbe japonica*, more commonly known as *Spiræa* or *Hoteia japonica*. The feathery spikes of flowers of this, notwithstanding their light, fragile appearance, stand well, and remain fresh for a considerable period when placed under the most adverse influence, such as a gas-lighted and overheated room. They may, at all events, be depended upon for remaining perfectly fresh during the continuance of any ordinary ball or entertainment.

The color and character of the flowers admit of their being employed in conjunction with those of a large number of winter flowering subjects. The flowers of the *Euphorbia* and *Astilbe* form most effective combinations, either in the hair or upon the dinner table. The two combined, with the addition of a few double Russian violets, are most popular here for the little glasses placed by the side of each guest. To make the most of the *Euphorbia*, the spike is cut up into lengths of about an inch each, and secured to thin strips of wood, to keep them steady in the glasses. By this means one good spike will serve for filling five or six glasses. We of course contrive to place the bottom of the stem so that it touches the water; but if it does not, the leaves should be removed and replaced with a fern-frond or a leaf or two of the *Astilbe*, as they show signs of exhaustion first.

Black Alpaca Dress, Etc.—GRACE L. asks how to make a black alpaca dress; also how to arrange her hair to wear with chatelaine braids. A very stylish way of making black alpaca, or any plain goods, is the basque waist, pointed back and front, coat sleeves, frilled at the wrist, overskirt looped at the hips, and lower skirt trimmed at the bottom with side plaiting four inches deep, above which place a deep flounce, gathered or put on in box plaits, stitched down a few inches from the top; add a Talma of the same for the street. Chatelaine braids are no longer worn. The back hair is dressed conveniently high, and worn in a simple coil of braids. The front hair is brushed over a roll in the Pompadour style—sometimes plain and sometimes crimped. To round faces this style is becoming. One or two long curls at the side are worn, but waterfall curls are quite out of style.

Etiquette.—LAVINIA E. asks:—"1st. Should a lady invite a gentleman to call upon her, if he occasionally walks home with her from church or a party? 2d. Should she always thank him for his company home from any place? 3d. Should she ask him in for a few moments when they arrive at the gate?" To the first, yes, if she desires him to do so. To the second, certainly; extend thanks for all favors received. Upon the lateness of the hour, when arriving "at the gate," depends the expediency of inviting a gentleman in. If the hour is early, it is polite to do so; but if late, a gentleman usually has the good sense to decline such an invitation, if extended, which is often done for "mere form's sake."

Protruding Teeth.—"MOTHER."—Your child's teeth may be gradually pressed into proper shape by the application of a rubber band, which any first-class dentist can put on and attend to at intervals. That any child should be doomed to go through life with ugly, misshapen teeth, is but too common a fault of parents, whose omission of duty in such matters is something a child, in maturer years, finds hard to forgive. Science and art have advanced to such a degree in the present age that excuse for physical deformities of any sort, to be allowed to become prominent, is only another name for gross, unpardonable carelessness.

Handkerchief Ring.—SALLIE.—Such rings may be had from $8 up. No; I do not "advise" you to get one. Handkerchiefs are for use and not for show, and to carry one for mere display, to me, seems silly and vulgar. Moreover, Paris "fashions" say rings are out of style, and the handkerchief is carried in the pocket.

Reading "	3.00 "

All orders for Advertising received at the New York office on or before April 1st will be charged at present rates only.

The following article from our issue of Feb. 3, 1872, contains a cogent reason for the above "New Departure" in regard to Advertising Rates:

The Rural's circulation has rapidly increased during the past month. Our Chief in the Mailing Department reports that we have already nearly as many subscribers for 1872 as we had at the close of last year. Considering that a great majority of our subscriptions expire with the year, this is remarkable—unprecedented, certainly, in the history of the Rural New-Yorker. It proves that the Rural's "New Departure" is popular, and that our Agent-Friends, all over the Continent, are active and influential. Indeed, their efforts and remittances are augmenting rather than diminishing as usual at this season. Thanks to all friends, everywhere! If our circulation continues to increase, in accordance with present facts and indications, we shall feel constrained to advance our Advertising Rates on or before the first of April.

N. Y. STATE AGRICULTURAL SOCIETY.

The Annual Meeting of this Society was held in Albany, Feb. 14th,—the first session being called to order by President Church in the Assembly Chamber at 12½. The report of the Executive Committee was read by Secretary Harison. It gave an interesting synopsis of the proceedings of the Society during the past year, as well as of the nature of the products and crops of 1871. Among other things it stated that there was during the past year an unusual drouth. The Whea. crop was large; Spring grain showed average crops. Corn was under the average. The Hay crop was better than in 1870, but was considered a light one. The report shows the Society to be in excellent condition. The Town and County Societies are also prosperous. The report was accepted.

Luther H. Tucker, Treasurer, made a report—including the following figures showing the

RECEIPTS AND EXPENDITURES FOR THE YEAR.

An'l memberships,	$314 00	Interest account..	$1,027 70
Life memberships,	549 00		
Miscel. sources.....	52 94	Total receipts..	$35,035 13
State appropriation	1,706 25	On hand per rep't Feb. 8, 1871	20,152 64
State appropriation for entomologist.	1,500 00		
State Fair ticket office receipts.....	29,438 24	Total.....	$55,247 77

Credit by payments for the year as follows:

Premiums, &c., at winter meeting.	$294 00	Erections and grounds	$15,358 72
Premiums of previous year.....	875 00	less subscriptions and refreshment rental,	$11,783 00,
Salaries and clerk hire.....	5,020 00	leaving a balance of.....	$3,575 72
Incidental exp....	110 95		
Postage	233 72		
Library & mus'm.	285 72	Total payments	$25,922 73
Print'g & stat'ny.	826 43	Cash in U. S. securities on hand Feb. 14, 1872.....	29,325 04
Entomological & veterinary	1,725 90		
State Fair exp's...	6,350 93		
State Fair prem's.	7,002 02	Total.....	$55,247 77

Gen. M. R. Patrick delivered an eloquent address upon the life and character of the late

THE PRINCE OF WALES.—[See next page.]

Hon. William Kelly,—former President of the Society,—concluding by presenting appropriate resolutions, which were adopted.

On motion the usual committee of three from each Judicial District was appointed for the purpose of nominating officers of the Society for the ensuing year. This committee, after retiring, soon returned, and presented the following report:

Pres.—Milo Ingalsbe, Washington Co. *Vice-Prests.*—1st, John D. Wing, New York: 2d, Edwin Thorne, Dutchess; 3d, Daniel Doncaster, Albany; 4th, Frank D. Curtis, Saratoga; 5th, James Geddes, Onondaga; 6th, Alexander S. Diven, Chemung; 7th, Benjamin F. Angell, Livingston; 8th, William H. Pendry, Orleans. *Cor. Sec.*—Thos. L. Harison, St. Lawrence. *Rec. Sec.*—Wm. H. Bogart, Cayuga. *Treas.*—Luther H. Tucker, Albany. *Ex. Com.*—Harris Lewis, Herkimer; J. W. Wadsworth, Livingston; Adin Thayer, Jr., Rensselaer; Wm. M. Holmes, Washington; John L. Cole, Wayne; Joseph Julland, Chenango; Wheeler H. Bristol, Tioga; Robert J. Swan, Ontario.

The report was accepted and persons named duly elected.

In the evening the retiring President, Richard Church, delivered the Annual Address—and then introduced the newly-elected President, Milo Ingalsbe of Washington County, who assumed the chair. The report of Dr. Asa Fitch, Entomologist of the Society, was then read and adopted. X. A. Willard of the Rural New-Yorker, read a paper on Market Fairs, and after some discussion thereupon the Society adjourned.

On Wednesday forenoon the new Board of Officers met. A very animated discussion was had upon the question of permanent location—which resulted in the appointment of a committee. The constitution was amended, changing the time of annual meeting from February to the Wednesday following the third Tuesday in January.

The members and officers then adjourned to the Society's Hall, where A. S. Fuller of the Rural New-Yorker read a paper on Forestry, and the question was subsequently discussed at some length. A paper was also read on the Characteristics of different breeds of Pigs, by Joseph Harris.

THE WINTER EXHIBITION.

This was comparatively meager—inferior in point of display to that of last year. Most of the entries were of Fruit. Several new inventions were exhibited. Below are the

Premiums Awarded.—John G. Davis, Herkimer county, Marigolds, $20. L. L. French, Richfield Springs, approved, special, $5. W. P. Ottley, Phelps, experiment with wheat, premium cup, $30. Peter Van Wie, Bethlehem, 20 varieties of apples, $10. Do. 10 varieties of apples, $5. W. P. Ottley, dish of one variety, $5. Peter Van Wie, dish of one variety, Trans. Do., seedling, $5. O. B. Gridley, Deansville, collection of pears, $10. H. H. Ingalsbe, South Hartford, Skeleton Harvester Guard, certificate of merit. William M. Holmes, Greenwich, Hand-Power Circular and Scroll Saw, certificate of merit.

BUSINESS INFORMATION.

The Cayuga Lake Railroad.—This Road runs from Ithaca, Tompkins Co., Northward about forty miles along the Eastern shore of Cayuga Lake, connecting with the N. Y. Central and Erie Canal at the village of Cayuga. It furnishes the only outlet Northward from Ithaca—the Northern terminus of three roads, viz., the Ithaca and Owego, the Ithaca and Athens, and the branch of the Delaware and Lackawanna. The two latter are Coal Roads, penetrating the richest coal fields of Pennsylvania, and give the Cayuga Lake Railroad an unbroken connection by uniform gauge, to the coal fields of the Lehigh and Susquehanna Valleys—and it is estimated that the coal trade of this Road will be very large, for the reasons that there are no grades to overcome, and, being ten miles shorter than any other road extending from the coal fields to the N. Y. Central R. R., it will be able to deliver coal at its Northern terminus at rates which preclude competition. The Road, near its Northern extremity, runs through and across the most extensive and valuable beds of Gypsum to be found in this State, which will furnish full and profitable freights for the cars returning from the coal fields. This valuable fertilizer being in great demand in Pennsylvania, it will be seen that, unlike other coal roads, whose returning trains are usually empty, those of this road are abundantly employed. The agricultural capacity of Western New York is well known; the cereal grains are produced in abundance, while every description of fruits are shipped in profusion to New York, Philadelphia and Baltimore. This Road supplies a want long felt by the people of its section—the finest and most populous agricultural district, generally known as the "Garden of the State." It is the only outlet Northward, and connecting, as it does, with the Central, the passenger traffic must, of course, be very profitable. The capital stock of the Company is $1,000,000, of which amount about $650,000 have been subscribed on the line of the Road. The bonds are issued for $1,000 each, payable in thirty years (with interest coupons attached—principal and interest payable in gold), and are amply secured by the first and only mortgage on the entire property of the Company, extended to E. B. Morgan of Aurora, and C. H. Merriman of Auburn, as trustees. Messrs. Leonard, Sheldon & Foster, No. 10 Wall St., N. Y., are the representatives of the Company for the sale of the bonds.

A Good Security.—People who now hold 5-20s of the United States will soon be seeking some other bond of equal safety, since the Treasury will call in forty millions additional of the 1862s in March. Northern Pacific Gold Bonds, 7-30s, are really real estate mortgages and railroad bonds combined. They are now offered at par, and it is doubtful if any bond in the market could be more secure. Before investing elsewhere, every one should examine these bonds.

Boynton's Lightning Saws.—Having recently carefully examined and witnessed the wonderful performances of these saws, we think they possess several advantages over the old V-tooth style, especially in the cross-cut saws. Indeed, for speed and ease of cutting, and perfect clearance, Boynton's Cross-Cut Saw appears to be far in advance of any we ever before saw or operated—and we have used cross-cut saws in the West, and handled (with another person) the Lightning so successfully that we were greatly astonished; for we cut through a chestnut log, nine inches in diameter, in four seconds. In a Circular just received it is stated that two Boynton brothers, by hand, cut off a twelve-inch sycamore (buttonwood) log in *eight seconds*, before Major-General Meade and other distinguished men, in Philadelphia, Sept. 1, 1869. We also note, as a proof of the case that permits sustained effort, the sawing, by hand, of twenty-six cords of hard beech, maple, elm, ash and hickory wood in eight hours (ten hours, including lost time) in Michigan. Such work, by two men with one saw once filed, is wonderful.

For diagrams of the style of the teeth of the Lightning Saw, testimonials, etc., see advertisement of Mr. E. M. Boynton in this paper.

Cahoon's Broadcast Seed Sower, advertised in this paper, seems to be obtaining the popularity it merits. Among many commendations here is one from Hon. L. L. Coe of Catharine, Schuyler Co., N. Y., to whom we sent one of Mr. Cahoon's machines as a Premium for obtaining subscribers to the Rural New-Yorker:

Catharine, N. Y., April 4th, 1871.

D. H. Goodell & Co.—*Dear Sirs:* I have received one of your Seed Sowers through the kindness of Hon. D. D. T. Moore. Also a letter from you, in which you ask me to circulate the circulars you sent with the Sower, which I shall take great pleasure in doing. I first used the Sower to feed my chickens; it did the job well, and kept them picking all day. This afternoon I sowed three acres of clover seed, and am satisfied it did the work better than it can be done by hand. I am well pleased with the Sower, and think there is nothing about it but what I can easily understand.

Yours with Respect, L. L. Coe.

Catalogues Received.—From J. B. Jones, Macedon, N. Y., catalogue of nursery stock; from W. B. Dimon, Jr., & Co., Brooklyn, N. Y., spring catalogue of seeds, bulbs and bedding plants; from Dexter Snow, Chicopee, Mass., catalogue of plants for 1872; from R. Cumming & Co., Pittsburg, Pa., descriptive and illustrated catalogue of Knox fruit farm and nurseries, their catalogue of vegetable and flower seeds, and of roses, shrubs, evergreens and ornamental plants.

PUBLISHER'S SPECIAL NOTICES.

The Rural New-Yorker is electrotyped, and hence Back Numbers can always be supplied. Copies for sale by all News Dealers; price Six Cents.

Form New Clubs!—Now is a good time to form new clubs. Agents and Subscribers (both new and old) can do this with little effort—and secure good pay in the shape of Premiums. New subscribers can begin at the time of subscribing, or with year and volume—thus securing all of the Thrilling Romance we are publishing, beside many excellent articles and beautiful illustrations.

Additions to Clubs are always in order, whether in ones, twos, fives, tens, or more. A host of people are subscribing for papers about these days, and we hope our Agent-Friends will give everybody an opportunity to subscribe for the best.

No Traveling Agents are employed by us, but any person so disposed can act as Local Agent, on his or her own authority, and secure premiums, etc.

Show Bills, Specimen Numbers, Etc., of the Rural New-Yorker sent free.

BUSINESS NOTICES.

QUANTITY vs. QUALITY.

Dooley's Yeast Powder stands pre-eminent in market as being the only Baking Powder that is free from injurious substances. Not only this, but each package contains the FULL QUANTITY REPRESENTED, while the quality is far superior to all others. Dooley's Yeast Powder will produce from twenty-five to fifty per cent. more good bread, rolls, biscuits, pastry, &c., than those of other manufacture, while it is always convenient to have in the house, and is reliable and economical. If you have not tried it, ask for it at your Grocer's, and take no other.

DR. STRONG'S REMEDIAL INSTITUTE,

Saratoga Springs, N. Y., is unsurpassed in the treatment of Lung, Female and Chronic Diseases. Turkish, Russian, Electro-Thermal and Sulphur-Air Baths. Hydropathy, Vacuum Treatment, Movement Cure, Oxygen, Calisthenics, &c. Terms lowest in winter. Send for a Circular. Endorsed by Bishop Janes, Rev. T. L. Cuyler, D. D., and Tayler Lewis, LL. D.

Lung Complaints, Bronchitis, Asthma, &c., are speedily relieved, and, if taken in time, permanently cured by Jayne's Expectorant. You will find it also a certain remedy for Coughs and Colds.

THE WAKEFIELD EARTH CLOSET.

Get Descriptive Pamphlet at 36 Dey St., New York.

HOW TO OBTAIN A "COLLINS"

Solid *Cast* Cast-Steel Plow for $5. For particulars, address COLLINS & CO., 212 Water St., N. Y.

The Qualities of Burnett's Cocoaine, as preventing the hair from falling, are remarkable.

THE PRINCE OF WALES AND HIS RESIDENCES.

In a few days (the 27th inst.) the whole British Empire will keep a day of thanksgiving, for the restoration to health of the Prince of Wales, the heir to the British throne. The Queen and the royal family are to attend church at St. Paul's, which will seat 8,000 people. Recent events have called the attention of the world to the Prince, whose portrait we give on the opposite page. He was born at Buckingham Palace, Nov. 9, 1841, and was married to Princess ALEXANDRA of Denmark, March 10, 1863. He has five children—two sons and three daughters. He is born as Duke of Cornwall, and has from that duchy an income of $250,000 a year. When reaching the age of twenty-one, he came into possession of a large sum of money from this duchy, which had been saved by the Prince Consort, ALBERT. Out of this fund he purchased the Sandringham estate, three illustrations connected with which we give the readers of the RURAL. The Prince's farm consists of 8,000 acres, in the County of Norfolk, on the river Wash, seven or eight miles from the town of Lynn. Where it joins the sea it is a rich marsh land, the rest is a black sand and light loam upon chalk. The Prince is fond of out-door life, farming, hunting, etc. He has made great improvements on his estate, rebuilding many of the cottages of the tenants, setting out trees, etc.

Sandringham House, the Prince's country residence, is a fine building, erected a few years since by its owner. It stands in the midst of a park, surrounded by terraces, drives, etc. There is a lake well stocked with fish, a cover for pheasants, and a grove of fir trees. Some idea of the beauty of the surroundings may be obtained from looking at the view of the Prince's private walk, on our first page, which runs from the house to the church. This latter building, which is seen in our illustration, stands on a hillock at the north side of the park. It is well proportioned, having a nave, chancel, south porch and square tower. It contains stained glass windows, has a pulpit of stone, and a register which runs back to 1557.

Marlborough House is the London residence of the Prince. It stands at the west end of Pall Mall, next to St. James' Palace. It was built in 1710 for the first Duke of Marlborough. It was bought in 1817 for the Princess CHARLOTTE and her husband, Prince LEOPOLD. A new portico has been added, and other improvements made, to make it a fit residence for the Prince.

We may well doubt if any man was so universally prayed for, during a season of sickness, as the present Prince of Wales. All over Great Britain people of every denomination joined in prayer, and the same was ths case in America. Even in India Parsees supplicated their Gods, and we learn that the Jews in Jerusalem prayed for the recovery of the royal sufferer. They assembled in the Great Synagogue, lit up the candelabra in all the Synagogues of the Holy City, opened the portals of the Holy Ark, and prayed for his recovery. Learned men prayed the whole night at the tomb of Rachel, and others called upon God before the western walls of the ancient temple. So much praying should produce its effect upon the Prince. Not often does a young man see the world on its knees because he is sick.

MARLBOROUGH HOUSE.

DARK DAYS

Have embittered the lives of many of us. They will dawn for us again. Days when we look yearningly into the far corners of the earth for a gleam of comfort, and look in vain; there is not a ray in the sunless sky, not a star in the black, overshadowing firmament. But above this dreary earth, higher than the leaden sky, is Heaven. There lives One who sees our cares notes our oppressions, hears our sighs, pities our tears; and who will surely, in His own good time, cause the darkness to melt away in bright and loving light, if we do but patiently trust to Him.

ALASKA LADIES.

THE women of Alaska beautify their complexions with soot and red paint, and still further enhance their charms by wearing a bone through the under lip, the size of which is increased from year to year until, in some of the old ones, it attains a width of two inches. An Indian lady thus adorned, with her coarse, black, uncombed locks hanging in matted profusion around her beautiful pig eyes and lop ears, is only resistible to those whose affections are thoroughly preoccupied. The delights of courtship must be doubled by the pleasant aroma of salmon which pervades the premises and, as I have heard, their persons.

SANDRINGHAM CHURCH.

SANDRINGHAM HOUSE.

WAITING.

She had gazed from the window long,
Down the dim and crowded street;
She had listened with ear down-bent,
To the tread of the passing feet.

She had watched the last flush die out
From the cold, gray, wintry sky,
And the first pale star looked sadly down;
She had greeted it with a sigh.

Like a flash in the street below
The lamplighter sped along;
And solemnly, faint and low,
Came the notes of an old street song.

They were singing a well-known lay
She had often sung to him
Long ago, in the country home,
And her eyes with tears grew dim.

But she turned from the window away,
And glanced round the home-like room:
"Tears, tears must not greet him, oh foolish heart
I know that he soon will come."

And so, woman-like, with a half-breathed sigh,
She shuts out the dreary night,
Draws close the curtains and tends the fire,
Till the little room glows with light.

THE GRAIN OF MUSK.

I DROPPED a single grain of musk
A moment in my room;
When years rolled by, the chamber still
Retained the same perfume.
So every deed approved by God,
Where'er its lot be cast,
Leaves some good influence behind,
That shall forever last.

Our Story-Teller.

BEFORE AND AFTER.

A THRILLING ROMANCE OF THE WAR FOR THE UNION.

Written Expressly for Moore's Rural New-Yorker, BY TWO WELL-KNOWN AUTHORS.

[Continued from page 122.]

V.—In the Death Chamber.

"WAT's dat you say, you 'dicolus nigger?" said HANNIBAL, as he stood at the foot of the stairs, waiting for JAKE's return from his master's room, whither he had been sent by Mrs. HEATHERSTONE to discover the cause of her husband's unusual tardiness.

"JAKE dunno what he say," said the negro, with chattering teeth, coming hastily down. "Jus' wish you cum up here, HANNIBAL. If dat Colonel not dead, den JAKE neber see a dead man. For de Lor' Almighty's sake, tell dem folks in dar," pointing to the pleasant breakfast parlor, "to stop dar laffin! Oh, HANNIBAL! who'll eber tell 'em?"

"Did you wake him, JAKE?" inquired ALFRED, stepping into the hall—and then, noticing the frightened faces of the negroes, he softly closed the door, and without asking a question, ran quickly past them to his father's chamber. HANNIBAL followed, and entered the room just in time to hear ALFRED exclaim—

"Great GOD! my father is dead! Come here HANNIBAL, and tell me, if you can, that I am mistaken."

"No mistake about dis, dear Massa ALFRED," said the negro, tenderly, as he sat down on the side of the bed and took the rapidly stiffening fingers between his warm palms. The vacant eyes stared at them hideously.

"Been dead 'bout an hour, dear massa;" and HANNIBAL reverently drew down the heavily fringed lids, and sank upon his knees for a moment, entirely overcome by his grief. Then he said, softly:—"Hebenly Father, we lub thee, and trust thee forever and ever. Gib thy young servant de strength to bear de news to dem who as yet know not dat deff hab stole into dis house! And oh, blessed Massa JESUS, wash de soul ob de man thou hast dis day chose to come to thee, as wite as de driben snow. Amen."

"Bless you, HANNIBAL," said ALFRED, as the old saint arose; and for a brief moment the head of the master was tenderly pressed to the bosom of the slave.

"Dear boy, good boy! De LORD's pet boy," said HANNIBAL, softly, as he smoothed the white forehead with his huge hand. HANNIBAL'S touch was as tender as that of a mother, caressing the babe on her breast—and ALFRED rose superior to the dreadful circumstances.

"Ah, ALFRED! ah, ALFRED!" and MARGARET'S delicious contralto rung out sweet

and clear in the chamber of death. "Where *is* pa? and does he mean to starve us to death?"

"Bressed JESUS, don't forsake de young massa now!" said HANNIBAL, in low, quivering tones.

"Strength according to the need, my dear friend," replied ALFRED. "Come with me down stairs, HANNIBAL! I shall want you," and the two men proceeded on their painful errand.

But why dwell upon the dreadful scene? Mrs. HEATHERSTONE fainted—MARGARET grew stolid. Not a sigh or moan escaped her. She assisted SUSAN in restoring her mother to consciousness, apparently as self-possessed as ever. She seemed literally to have no feeling. Mr. BRAYTON looked at her in dismay. He understood it all. "If she could but weep," he thought: but no; tears and MARGARET HEATHERSTONE, whatever their relations in the past had been, had now nothing in common. "Died of heart disease," was the verdict of the coroner's jury. This MARGARET listened to from the lips of Mr. BRAYTON, whose heart yearned toward the bereaved girl with all the yearning of a brother; but this failed to rouse her. Night had settled down upon the mansion. Mrs. HEATHERSTONE, under the influence of a strong narcotic, administered by her physician, slept peacefully. MARGARET had expressed no wish to look upon her father, and seemed desirous of avoiding, as far as possible, all mention of his name.

"Don' you tink, my dear little Sunshine, dat yon'd bes' take hold of old HANNIBAL'S hand and go up stairs wid he and see how buful her pa be looking?" said the negro, stealing into the sitting room where MARGARET sat by the window looking out, unmindful of the presence of her lover and brother, who had been vainly endeavoring to draw from her some expression of sorrow or resignation.

"He is *dead*, HANNIBAL," she replied, softly. "I can do him no good."

"How you know dat, bressed chile? Because de precious LORD done gone take the fader to his self, for sum good reason anuder (HANNIBAL not pertend to underst and dem reasons), is it right to tink dat dem he lub de best on de earth or in de hebens can be no more good to he? Why, bress de chile's heart! HANNIBAL jus spec dis minute dat dear old massa be stan'ing in dis room smiling at de little girl, and wondering what make she keep away from the body she used to lub so well!"

"Oh, HANNIBAL!" sighed the girl, leaning toward him, and then, after a moment's silence, rising, apparently undecided what to do: "Give me your hand, HANNIBAL," she continued, "we will go to my father."

The scene in that room no mortal pen could adequately describe. Tears came, comfort came, and MARGARET, her little hand still encircled by the faithful negro's, walked from the apartment with a face as radiant as an angel's. HANNIBAL, with his patient love, his wonderful knowledge of the young lady's character, his great faith, had brought about that which the united efforts of the whole household could not accomplish. The cloud was dark and heavy to be sure, but behind it was the Saviour's face; and the old negro's strange words in regard to the presence of her father had opened up a new and delightful subject of contemplation.

"What is going to be done about SUSAN, Mr. BRAYTON?" inquired MARGARET, the evening after the funeral. "I can never forget how sure I was that nothing could happen to pa until he had completed this matter; but how little we know. I shudder to think how vexed I was when he said, 'If GOD spares my life till to-morrow.' Horrible, wasn't it?" and poor MARGARET turned her head away, entirely unstrung by the memories of that evening.

"There can probably nothing be done about this business until your father's will is proven and the estate administered, then, if it is found that Col. HEATHERSTONE intended to liberate SUSAN, I think there will be no trouble in doing it; at least I hope not, for SUSAN'S sake, and for ——"

Here the gentleman hesitated. MARGARET came to the rescue, in her sweet way.

"And for your sake, and all our sakes. Oh, Mr. BRAYTON, there is something inexplicable about SUSAN—something I have striven to get at ever since she came among us. I love her dearly, but she has never seemed like a slave to me, and never can. I have the strongest sort of a sympathy for her, sometimes. I beg your pardon, Mr. BRAYTON. Pa always used to say I was crazy on the SUSAN question. I hardly know what I was going to say. Did you ever see that portrait in the corner of the room? No? Well, then, come with me. If SUSAN had sat for it, it couldn't have been more like her;" and MARGARET led the way to a remote part of the rambling mansion, closely followed by her companion.

"There; this is the one; now, look sharp, Mr. BRAYTON," said MARGARET, arranging the light so as to bring the features out in full relief. "Did you ever see anything so perfect?"

Sure enough, the likeness was exact. There was the same clear-cut, exquisitely-formed face, the same sweet, patient expression, the same patrician cast of features, the same deep, earnest eyes."

"My father's sister—my dear aunt," replied MARGARET, in the same tone. "But who is that?" she continued, turning sharply round as a step fell upon her ear. "Why, it is SUSAN? What are you doing in this lonely place so late, dear?"

A sob was the only answer. With a groan Mr. BRAYTON attempted to pass out of the room. A sudden faintness seemed to overcome him. SUSAN was by his side in a moment.

"Oh! Mr. BRAYTON!" implored MAGGIE, "what is the matter—what have I done?"

"Please, dear Miss MARGARET, leave us for a few minutes. I have seen him this way many times before," said SUSAN, leaning his head upon her bosom and gently smoothing his forehead.

Wonderingly MARGARET walked out of the room, but not until she had seen that the whole soul of the slave was centered in the man by her side, and that BRAYTON, too, ——

Here MARGARET had to stop. She did not dare go on. BRAYTON'S honor she was sure of—she loved him for her father's sake and respected him for his own—and whatever his secret, she felt sure there was nothing wrong about it. Mr. BRAYTON had consented to remain with the HEATHERSTONES until the Colonel's affairs were settled, and MARGARET went to sleep wondering how it would all end.

VI.—Entering the Army.

It was an ill time for dreaming dreams or for brooding either joy or sorrow. Whatever hopes might have been cherished as to the peaceful ending of the secession threat; whatever certainty might have been entertained that the other States would frown upon the hasty action of South Carolina, there was no longer much room for doubt as to the result. During January, Florida, Alabama, Georgia and Louisiana passed secession ordinances. The surrender of Fort Sumter was demanded by Gov. PICKENS. The whole North was in a ferment. The President issued a call for volunteers, and the country began in earnest to make preparations for war. Now the real heart of the Nation, both North and South, began to show itself. Men had been speculators, slave holders, merchants, manufacturers, students, writers, artists, but separate interests were all fused in the intense heat that the passion of the South had generated, and every good citizen was first a patriot—a man of affairs afterward. Now was the time for enthusiasm and for sacrifice. Young men in colleges and workshops heard the sudden call "to arms," and books and work were thrown aside. In households all over the land, wives looked at their husbands, and mothers at their sons, with strange forebodings, and in an hour a nation of traders and artisans and farmers became a nation of warriors. What months of training would not have done for hirelings, a few weeks did for these men who fought, as each thought, for a sacred principle, so wonderful is the power of the soul in great crises to use the physical according to its will. February and March passed rapidly, and April saw the surrender of Sumter, and the march of Northern troops to the defense of the Capital. Every week the excitement grew more intense, and the fact could no longer be ignored that war was inaugurated, never to cease until North or South was conquered.

It was painfully evident to the family that GEORGE could not much longer be prevented from joining the volunteer troops every day leaving their homes for the preparations of battle. Skirmishes were frequent all over the State, and every new account seemed to inspire the boy's heart with courage and determination to act his part in the gigantic drama of his country. All in vain did Mrs. HEATHERSTONE plead her lonely and widowed position.

"What of that, mother?" he replied, one day, as with a burst of tears she sunk back among her sofa pillows exhausted. "Father knew, weeks before he died, that I should enlist. Indeed, I am sure he desired it. If he could speak to you now, I know his first words would be 'Let him go.' I am ashamed to remain home another day. I don't fancy the name of coward, mother!—do you? I should think you would much rather your son would be shot than to know he shrank from duty when his country needed him."

"Oh, GEORGE!" sobbed the poor woman.

"You have ALFRED and MARGARET, and I have no doubt but I can run home often to see you. If I enlist under General MAGRUDER, I shan't be so very far away, you know," and then starting up with sudden determination, continued, "I am going any way, so there; and I am going very soon, too. The quicker the thing is done the quicker it will be over with;" and he left the room, to all appearance utterly regardless of the moans of his mother. Not so. The poor boy's heart ached as it never ached before. But he did not relent. He made his preparations steadily and rapidly, and with an enthusiasm that nothing could chill. To the joyous, ardent imagination of the boy a war was a series of brilliant tournaments. There would be opportunity for great deeds, for daring, for victory and laurels. The very danger wooed him, for there was that within him which longed for expression in heroic action. MARGARET saw all, and said nothing. She followed her brother with her wistful eyes, her heart full of foreboding and sorrow. ALFRED tried hard to comfort his mother, but she would not be comforted. GEORGE was her pet, her idol. She thought it very cruel that he should leave her so soon after his father's death, and nobody could make her feel that another ray of sunlight would ever enter her life. At this time ALFRED and MARGARET were almost constantly together. Mrs. HEATHERSTONE lay on her sofa from morning till night, requiring SUSAN'S constant attention, and seemingly better satisfied with her society than with her children's. SUSAN would listen by the hour to her mistress' lamentations, and the weak, stricken woman seemed only to derive comfort from telling her troubles over and over.

"ALFRED," said MARGARET the day before GEORGE went away, "shall you go into the army?"

"God only knows, MAGGIE; at present my duty seems to lie here with you and mother. I hope, with everybody, that the struggle will be short. But the South may need all her loyal sons before this quarrel is settled. I would rather not take sides in such a war as this. I have too much sympathy for the North, too little wish to preserve slavery, to make me throw much heart into the contest. But, MAGGIE, I could not stand idly by and see my country desolated, for, after all, the South is my country."

"I foresee," said MAGGIE, "that you will all go—even the slaves will be scattered. O ALFRED! why did father die?" and the young girl threw herself into her brother's arms, shaken with irrepressible sobs.

Three days after GEORGE expressed his determination to his mother, he was gone, and the house was doubly desolate. As HANNIBAL said:

"Sunshine herself be Sunshine no more. But bress de LORD," the old negro continued, "he only hide he face a while; de light of he countenance shine again on dis troublous household. De clouds not last always; dat not in de order of tings. Take a good deal ob light to disumpate dis storm. Missus herself one big black cloud. But de LORD all light, and what de use ob doubting? Some tings grow better in de shade. 'Spect HANNIBAL one ob dose plants. He's had shade most ob de time, anyhow. Dis old nigger not mind de darkness so much for heself, but when de sky all full ob de thunder and de lightnin, and he see de chillen, widout anybody to help, it take all he faith." MARGARET interrupted this monologue by suddenly going into the cabin where HANNIBAL sat bent over the fire.

"What's that about faith? dear HANNIBAL."

"HANNIBAL was saying dat much faith needed to keep de heart up in dese times; and dat it 'quired more when de missus an' de chillens in trouble dan when HANNIBAL heself hab de clouds."

"That's because you are so unselfish, dear HANNIBAL."

"Not so much dat as because HANNIBAL lean on de breast ob de dear Massa JESUS, and get what he need for heself. HANNIBAL hab nothing in dis world, neber 'spect nothing, so it be quite natural dat he go straight to he dear friend in de hebben. HANNIBAL don't say dat de joy in dis world need to keep de heart from de SAVIOUR, but he say it mos' genally do. Dis poor ole slave hab no fear for any ob de peoples in dis house, if dey once find dere way to de LORD'S breast. It be so much better dan all else, dey miss nothing any more."

"Why, HANNIBAL, we should miss our dear friends when they leave us, no matter how near we get to JESUS."

"Dey not lebe you, dat's de good ting about it. De loving SAVIOUR he keep all your friends, and if you in he arms dere's you all dere together. Don't you see chile?"

"Yes, I see, HANNIBAL. If we could get there and stay there. How do you keep so near to CHRIST, HANNIBAL?"

"Spects as I done tell you little missus, I got nothing else. HANNIBAL 'bliged to go to de dear LORD years ago, and when he once got inside dose dear arms, he neber want to lebe.—[To be continued.

EGYPTIAN MAXIMS.

Do not put on airs. Do not maltreat an inferior; respect the aged. Do not save thy life at the expense of another's. Do not pervert the heart of thy comrade if it is pure. Do not make sport of those who are dependent upon thee. Do not maltreat a woman whose strength is less than thine own; let her find in thee a protector. If from an humble condition thou hast become powerful, and the first in the city for opulence, let not riches make thee proud, for the first author of these good things is God. If thou art intelligent bring up thy son in the love of God. If he is courageous, active, and increases thy property, give him the better recompense; but if the son whom thou hast begotten is a fool, do not turn away thy heart from him, for he is thy son.

WHAT A WIFE SHOULD RESEMBLE.—The Spaniards have a saying that a wife should resemble three things, and yet differ from these same things. First. She should be like a snail, which always guards its house, but she should not carry the house with her whenever she goes out. Second. She should be like an echo, which speaks only after the other is finished, but she should not always have the last word. Third. She should be like the town clock, which always sounds the hours with regularity, but she should not sound so loud that the whole town shall hear it.

ARE YOU SQUARE WITH THE WORLD?—"Farmer" discusses the question, and says: "A person in debt is a slave to his creditors. No man is truly happy so long as debt hovers over him." He commends the Chinese custom of going around the first month of each year and settling up squarely with all with whom they have had dealings the year past. In our judgment, so far as it is possible, is is better to end the year with no unsettled accounts, and begin the year resolved not to have any at its close.

CHOICE OF A WIFE.—Dr. FRANKLIN recommends a young man, in the choice of a wife, to select her from a bunch, giving as his reason, that when there are many daughters they improve each other, and from emulation acquire more accomplishments, and know more, and do more than a single child spoiled by paternal fondness. This is a comfort to people with large families.

Sabbath Reading.

DESOLATIONS.

"COME, behold the works of the LORD, what desolations He hath made in the earth."—PS. xlvi., 8.

THE great GOD treadeth on the earth
And worketh desolations;
A hush is on the human heart,
A hush is on the nations;
And through the peoples' quietude,
And through the hearts' appalling,
There comes a voice of majesty
Upon the terror falling:
"Be still, for I am GOD."

A vast empire is in the dust,
Two nations' hearts lie bleeding,
And pallid hands, in anguish raised,
Tell of the human needing.
The power that claimed a throne in Heaven
Is hurled to earth and broken;
"I'll be exalted in the earth"
Th' eternal Word hath spoken—
"Be still, for I am GOD."

Dread famine sits on Persia's shore
And gluts on human vitals,
And pestilence attends his steps;
Thus agony's requitals:
The tempest wakes the hurricane;
War famine; famine fever;
But still the voice from Heaven comes
To every meek believer,
"Be still, for I am GOD."

The breath of death grows thick and hot,
Earth's glory he is claiming;
The proud Queen City of the West
Beneath his glance is flaming,
And flash, and crash, and flying brands
Mark falling tower and steeple,
Until she sitteth desolate
That was so full of people.
Be still, there is a GOD.

The air grows hotter, denser still;
Westward the curse is rushing,
And forest trees, and homes, and hopes,
Neath sheets of flame are crushing.
The wild horse neighs, tosses his head,
Rushes into the burning.
Desolate lives and anguished souls
Are to the Smiter turning.
Be still, for He is GOD.

Chicago lies a blackened mass;
The regal West sits weeping,
Virginia's grasses lowly creep
Where hero hearts are sleeping.
So desolation's car rolls on,
While human hearts lie under,
And bleeding, mangled, agonized,
Give answer to GOD'S thunder:
"Be still, for I am GOD."

FAY VOY.

TRUTH BRIEFLY EXPRESSED.

IN regard to the True Value of Life, the greater portion of mankind are mistaken. They often suppose the true value of life to consist in acquiring riches, and in seizing the pleasures of the world. The greater portion of mankind are by no means deep thinkers. They look not at both sides of the question, and consequently they are, to a great extent, blinded. A man may be wealthy, and at the same time know nothing about the true value of life. He may be successful in accomplishing every worldly desire, and after all be a poor, pitiable creature. And, on the other hand, he may be unsuccessful in almost everything that pertains to the world, and appreciate the true value of life. Those who enlist under the banner of JESUS CHRIST realize the true value of life. Those who are grieved because they have neglected their duty, realize that

Honor and fame will come to nought,
When life shall have expired;
And happiness, then, must be sought,
For that is all's required.

Todd Co., Ky., 1872. G. D. S.

THE popular notions that, at the day of judgment, the past life of each shall be exhibited before men and angels, do not seem to be either morally valuable, or likely, as far as we can judge, to be literally true. In that other world those who feel rightly will have no wish for, and take no pleasure in, the concealment of anything about themselves, and would feel nothing but pain at the revelation of the sins and weaknesses of others. Who, then, at this great audit, will be the spectators of whom we are to be ashamed? Such spectatorship, unsympathizing, and prepared for a merely human and curious interest, for triumph and contempt, belongs to earth, not to heaven.—*Grote.*

TRIALS.—Trials *must* move us; but *how* is left for us to decide. If we let them alone like huge boulders they will keep heaping up, forming a great barrier between us and GOD. Let us put them, one by one, as they come, beneath our feet, and we will find them lifting us higher out of life's stormy billows, into the pure, sunlit atmosphere of heaven.—*Rose Geranium.*

THE Christian needs a reminder every hour; some defeat, surprise, adversity, peril; to be agitated, mortified, beaten out of his course, so that all remains of self will be sifted out.—*Dr. Bushnell.*

Ladies' Port-Folio.

SUMMERS AGO.

BY ALIQUA.

SUMMERS ago we wandered there
On banks of the valley river,
That winds through meadows broad and fair,—
Fields that are beautiful ever;
Fair in the sunset's rosy glow,
Fresh in the dew of the morning,
Pure in their robes of gleaming snow,
Fair in the summer's adorning,
When golden blooms their beauty veil
In spiders' daintiest laces,
And ever up where cloud-ships sail
Look the daisies' patient faces;
When idle breezes passing by
Break the long grass into billows,
And kiss the stream to hear it sigh
In the shade of fringing willows.

Summers ago the feet passed on
Out of childhood's golden meadows,
Find 'neath mosses the roughest stone
And the sunshine edged with shadows;
Soft hair loses its gleam of gold,
Relax of buttercups' blooming,
And eyes that clearly shone of old
Catch the river's deepest glooming.
Oh for a pressure warm and true
Of hands now folded forever
That gathered violets sweet and blue
With ours by the valley river,
While wild-birds' merry songs and trills
Rippled all the meadows over,
And breezes came from distant hills
With the breath of fragrant clover.

Summers ago at silent noon,
When the heat waves rise and quiver,—
Chiming with crickets ceaseless croon,
Came the murmur of the river;
Low in the hush of evening time,
And louder in midnight shadows,
On misty wings with bells' far chime
The sound came over the meadows;
And floats through halls of memory still,
With the tones of friends now sleeping
Where cold white marbles crown the hill,
And below the waters sweeping
Sing ever of a sunny land
That is bounded by death's river,
Sing ever of a gabling Hand,
Of our GOD o'er all forever.

MISS D.'S VISIT.

"AND you *must* go, Miss D?" said Mrs. W., standing in the door, with her sleeves rolled up, while the little school-teacher tied on her hat. "I'm much obliged for this little visit, but mighty sorry the house wasn't cleaner and in better order. 'Eternal vigilance is the price of liberty,' as the paper says in big letters, just afore 'lection time—then isn't eternal scrubbing the price of a clean house? Last night while I was a settin' the table, I heard you 'n the squire's son talking of the wars of the roses; now I never had no time to read them hist'rys, though I'd like to, best kind; but I do know 'bout the Revolution, and how we whipped the Britishers, for my grandfather was in the army; was at the battle of Bennington, and I don't know how many more. He used to tell us children 'bout it. You see I've had a constant battle. I, at home with the work and dirt, nigh on to twenty years now, with five boys of my own to look after, and two or three hired men most of the time, four or five cow's milk to 'tend to, I *can't* keep things as nice as I'd like to; but if I'd knowed you was coming I'd a slicked up a little. Somehow, every time it rains, them boys track the house all up. You know it jest poured down yesterday mornin'. I've been trying this long time to get WILLIAMS to make some walks, but he don't see no use in 'm."

"Don't make any more excuses, Mrs. W.," said Miss D., a little embarrassed by this sudden flow of energetic talk from the hard-working woman usually so reticent, "the house looks well enough, and I've had a first-rate time. You're very comfortable, only you look so tired and worn out; you're trying to do two women's work instead of one. You ought to keep a girl all the year round."

"Yes, I 'spose so, but WILLIAMS, he's so particular 'bout his cooking; nothin' ever 'grees with him but what I cook myself."

"Don't agree with his pocketbook, (the price of the girl) that's where the trouble is," thought Miss D. to herself.

"Thank you again," continued Mrs. W., "for the trouble you took with our JIM last winter; helping him in his 'rithmetic, out of school, was mighty good of you. Only think, last week WILLIAMS promised he might go to college this fall, with the Squire's SAM, if he'd work well this summer. Now, he's out of bed by four o'clock, and works as spry as a cricket. I've a notion that little talk of your'n with his father did some good; anyhow he's a goin', and I've lots of sewing to do to get him ready, but I'd do that nights after twelve o'clock rather'n not get him off when school begins. My boys all take to lernin', just as I did, though I hadn't no chance. WILLIAMS don't see any use in boys knowin' any more'n readin', writin and 'rithmetic; says that's enough for a farmer, but I mean my boys shall all go through college just as my younger brother did. I paid his first term bill sellin' butter, and now he's in the Legislatur." Mrs. W's eyes flashed with sisterly pride as she said this, but the bright expression soon gave way to the uneasy one that usually rested there. Miss D. noticed this and turned aside to conceal the emotion that told her sympathetic tears were not far away from her own eyelids, as she listened to this plain woman's story, and saw that even long years of hard work and trial had not crushed out lofty aspirations for her sons, and patient devotion to their welfare.

"Well, I oughtn't to be hindrin' you," said Mrs. W. "I know it's most school time. I don't know what got in me to tell you all this, only you took such an int'rest in my JIM. Here's some nice harvest apples AL. found for you; let me put them in your basket; they're the earliest in the neighborhood. Good-by; your visit's done a sight of good. Next time come Friday night and stay till Monday mornin'. Good-by;" and with an earnest pressure of the hand, Miss D. turned down the shady lane.

At first she walked with a quick, impatient step, that kept pace with the indignant feelings stirring her spirit.

"What a shame," she said to herself, "that he makes her life so hard. If she hadn't had an iron constitution she'd have broke down long ago. I suppose he'd be very much surprised and offended if any one told him he wasn't kind to his wife; but if such utter disregard for common conveniences around the house, and such a selfish use of money to gratify his pride in the fine farm and broad acres, while she works herself almost to death to save a few dollars in the house, is kindness, then *I* don't know what the word means."

"Mrs. W. don't suspect how I talked to him about sending JIM to college; not of the advantages of education,—might as well talk to the wind, unless education would bring money—then he'd listen. I read his nature, and then brought my battery to bear on the one vulnerable point—his pride. Told him Squire N.'s son had just graduated with *so much* honor that the next son was going to college, and his JIM was much the smarter of the two, for they both recited to me last winter, and wound up by saying how sorry I would be to see JIM fall behind when he had the start now, and his father was so well able to send him to college.

"I can send JIM just as well as Squire N. can SAM; he shall go next September, Miss D."

How I laughed in my sleeve, but didn't dare say anything about it. If there's anything Mr. W. dislikes 'tis to have it said he's behind his rich neighbor. If walks, new pumps, and kitchen conveniences were only the fashion over there, how soon Mrs. W.'s work would grow easier.

Miss D. slackened her pace as a gentler mood came over her. "A constant battle at home with the work and dirt, nigh on to twenty years," said she to herself, musingly, as she repeated Mrs. W.'s words. "There are conflicts well worthy the name never recorded by a BANCROFT, and true victories unnoted by a MACAULEY. What a grand life she has had; yet how patient and uncomplaining; her literary taste outlives the years of starvation, and her determination, too, that her boys shall have what she has longed for in vain. How many throw away opportunities which she would gladly improve. Yet the law of compensation, our teacher used to tell us about, can be seen even here. So the distinguished lawyer, Mr. F., is *her brother*, and *she* gave him the needed help in the critical time that determined his course in life. She will be rewarded, too, in her boys, if they are educated as she intends they shall be. They will each one be a 'man among men,' whether they till the soil or choose a profession; for they are like their gifted mother. But it's ten minutes after nine!" and Miss D. hurriedly rang her bell and hastened into the school-house.

MAJASA.

WHAT word is that in the English language the first two letters of which signify a man, the first three a woman, the first four a great man, the whole a great woman?—Heroine.

A LITTLE girl in Ithaca, just before she died, exclaimed:—"Papa, take hold of my hand and help me across." Her father had died two months before.

AT a wedding which took place in New York recently, the bride was followed to the altar by twelve little girls, members of her class in Sabbath School.

Reading for the Young.

HOW WE SPEND OUR EVENINGS.

BY AUNT PHEBE.

PLAY, NATURAL HISTORY, ANAGRAMS, BURIED CITIES, ETC.

THE long winter evenings have come, and we are ready to improve them in the best way; and that, we think, is to have a variety—a little study, a little reading, a little play—and with it all a good deal of amusement.

The little ones always have their "play-spell"—we old ones joining—and a noisy time it is. But after the children are in bed, father reads his paper, mother keeps the knitting needles bright, while RILLAH, JOHNNIE and I "improve our minds," and make amusement for the others.

We have become much interested in Natural History. Shall I tell you something about what we have learned? We have found that the Animal Kingdom has four grand divisions—the Vertebrates, the Articulates, the Molluscs, and the Radiates. Of these the Vertebrates are the most important; and perhaps it will help you to remember their name if I tell you that this class includes all animals having *a backbone*, or vertebral column. I heard old Mr. SMITH say, the other day, that LEMUEL GREEN would "never amount to anything; he hain't got *back-bone*." But I rather think he'd be included in the *Vertebrates*, after all. Vertebrates are divided into warm-blooded and cold-blooded. Warm-blooded Vertebrates are classed as Mammals, or Mammalia, and Birds. The Mammals are said to be *viviparous*, or "born alive;" and Birds, *oviparous*, or "born an egg."

According to HOOKER, Mammals are divided into five sub-classes. 1. *Bimana* (two-handed), of which man is the only example. 2. *Pedimana* (foot-handed), including only the ape and monkey tribes. 3. *Cheiroptera* (hand-winged), the bat tribe. 4. *Quadrupeds* (four-footed Mammals). 5. *Cetacea* (marine Mammals).

Perhaps, as you read this over, you will think it very dull, but we haven't found it so, I assure you. You will find it is very easily learned, and it is the *foundation* of natural history, one of the most delightful studies you can engage in.

We invent a great many charades, enigmas, etc.; and you can't tell till you try it. How much enjoyment you can have in this way. To be sure, ours are not as sharp as some you may find in the RURAL's Puzzler, but they have the great advantage of being "home-made." So last night RILLAH passed me these Anagrams of the *Pedimana:*

1. Nip nee Zach.
2. Roun nag go tu.
3. A big blie gon.
4. U sell ten.
5. Darn mill.
6. Moses M. Tar.
7. Mule fled furr.

Can the young Ruralists furnish answers?

Here are some of JOHNNIE'S Buried Cities in Wisconsin:

1. Clouds of amber linger in the west.
2. While near I ponder on the scene.
3. He took Jack's part at school.
4. I never, till the war, saw soldiers.
5. So we went, we twa, up unto the mountain.
6. When they drill on the green, bayonets are used.
7. Oh, pshaw! No, don't think of it.

LETTER TO RURAL CHILDREN.

BY ROSE GERANIUM.

I'M rather tall for "children." I'm just five feet three inches, and perhaps I'm a little old, being twenty-two, but my heart don't seem to grow up very fast, and I thought perhaps you would admit me to your circle. I want to tell you about my doll. I received her four years ago, on St. Valentine's day. I call her Maude Genevieve Moore. She didn't wear out like ordinary dolls, but kept developing and improving, I think. In fact, I guess you all understand she is a live doll. She is a pure brunette, and a perfect type of mischief. She has made me do more laughing and sighing than I can make you imagine. When she was a year and a-half old a little girl brought her a kitten—the first one she ever saw. Pretty soon she learned to nurse it, and being rather rough one day, she made it cry. She was in ecstasy. "O, mamma," she cried, "'is titten is singin' for Desus! 'E dear fing!" And she listened to no explanation, but persisted in squeezing the melody from its throat until I had to put it beyond her reach. Shortly after, she saw the first snow falling, and called us to see "Desus is froing sugar down for MAUDIE." She was disgusted at its tastelessness. Discussing the mysteries of our last Christmas, she broke forth—"I tell 'oo Santa Twaus dus' bings his own chimney along to climb down. Do 'oo 'spose he'd tum down 'at dirty fing?" pointing scornfully toward the fireplace.

She can only make-believe at reading, but she is very literary. Here is one of her essays. It is a year old. I copied it while she demurely read from a blank envelope:

"What could o' comed o' my dolly's leg? Its leg's comed out an' there's a hole there. My dolly could walk onst, when it had a head. Wish't I could buy my dolly a new leg; not a man's leg, but a stick leg. I did'nt bite its head off—it broked."

May I enter your circle, children? If I may, I will write about my flowers next time.

A MEW-SICAL CAT.

DEAR EDITOR:—I want to tell you about a gentleman of my acquaintance named GOTTSCHALK. A very gentlemanly, *entertaining* person is GOTTSCHALK—a musician, too. But, strange as it may seem, he's not a man—he's a cat. One night, after spending a delightful evening with some friends, we girls went to bed. Soon after we were all quieted down a little, we were considerably startled at hearing a sound as if some person were striking the keys of the piano at random. Not only astonished, for we were all in bed, but a little alarmed, we listened for a while, and then, summoning all of our courage to our aid, we set forth on an exploring expedition. On entering the parlor we saw no one on the piano stool, but just as we were going away, another key was struck. Determined to solve the mystery, we went still closer, and what do you think was revealed to our astonished gazes?

Why, a Maltese kitten enjoying the quiet hour of midnight in musical entertainment. Grave as a judge, there he sat, striking the keys with his fore-paw, and, cocking his head on one side he would listen attentively till the sound died away, and then strike it again, apparently greatly enjoying the music (!) he created. We immediately dubbed him GOTTSCHALK, and GOTTSCHALK he has remained ever since. After that we often caught him *performing*, and listening with the air of a connoisseur. Our feline musician retired from his public career about the time of the death of his greater contemporary and namesake,—must have been overwhelmed with grief. He still likes to sit near the piano when any one is playing, and listen with an air of intelligence.

MATTIE D. WOODWARD.

☞ Answer in two weeks.

MISCELLANEOUS ENIGMA.—No. 3.

I AM composed of forty-seven letters.
My 4, 3, 7, 39, 23, 28, 44, 3, 20 is a musical instrument.
My 5, 14, 15, 18, 11 is a passage into a mine.
My 5, 22, 10, 8, 31, 47, 31, 10 is a servant.
My 35, 10, 34, 37, 16, 45, 38, 9 is a figure having three angles.
My 41, 3, 20, 20, 37, 14 is a woman's name.
My 17, 37, 44, 10, 42 is a place where milk is set.
My 43, 15, 4, 32, 2, 22, 33 is one of the Apostles.
My 14, 44, 20, 21, 38, 7 is a stringed instrument of music.
My 40, 46, 10, 26, 33 is to cast.
My 1, 12, 19, 23, 7 is a destitution of color.
My 36, 6, 10, 26, 43, 9, 25, 10, 13 is the measuring of time by hours.
My whole is a verse in the Bible.

News of the Week.

GENERAL REVIEW.

THE assassination of Earl Mayo, the Governor-General of India, is the sensation of the week. It has served to call off the attention of the English from the Alabama claims, somewhat, although they are still discussed....The great snow blockade on the Pacific Railroad continues, and the Japanese are detained at Salt Lake....Investigations of frauds are the order of the day everywhere....Maine endorses Grant... There are indications that Mr. Colfax will be next Vice-President... The New York Legislature will take ten days to celebrate Washington's Birthday.... President Grant has commenced to reform the New York Custom-House business....The sensation at Washington is the inquiry instituted in relation to selling arms to France during the German war.

DOMESTIC NEWS.

New York City and Vicinity.

THE friends of Rev. Mr. Hepworth have raised $100,000 for a new church....The Grand Jury, on the 10th, brought in indictments against Mayor Hall, R. B. Connolly, Wm. M. Tweed, E. A. Woodward, Hugh Smith, Peter B. Sweeney, Nathaniel Sands, James M. Sweeney, and five others. Mayor Hall is to have his trial on the 19th...Colored people are refused admittance to the Grand Opera House....It is proposed to remove Columbia College. ..The Market Savings Bank has been adjudged a bankrupt. ....Foster, who murdered Putnam, has had a hearing for a new trial ...A jury has been obtained for the preliminary trial of Stokes, who killed Fisk... Walter Roche has been arrested for misappropriating the Bowling Green Savings Bank funds....The Bar Association has declined to bring charges against Judges McCunn and Ingraham....The trial of Dr. Cuyler for allowing Miss Smiley to preach has excited much comment in all the papers... The workingmen held a great meeting at the Cooper Union on the 14th, demanding that the eight-hour law be enforced and new laws enacted....On the 14th a large fire in Baxter St. destroyed a $60,000 frame factory.

Miscellaneous News.

FOUR car loads of supplies have been sent to the passengers blockaded on the Pacific Railroad from Salt Lake city.... There has been a massacre of 36 people in Zundel, in the Argentine States. ..The Chinese in Cuba are to be enslaved. .The Press of Vienna says England expects an unfavorable decision in the Alabama matter, and fears the consequences of her course toward the United States....The Grand Duke has been magnificently received in New Orleans. ....Rev. J. P. Thompson, late of New York, has been invited to lecture in the University of Berlin. Archbishop Spalding was buried in Baltimore with great state....The great snow blockade on the Pacific Railroad continues. There has been a fall of 54 inches of snow. Nine passenger trains are in the snow, and 1000 car loads of freight....A severe snow storm has prevailed in the North-west, and it is feared the Canadian surveying party of 25 has perished....Mardi Gras was celebrated with great eclat in New Orleans.

Political.

THE President has discontinued the General Order warehouses in New York....Col. John W. Forney has resigned the Philadelphia Collectorship ...The friends of the Amnesty bill still hope to get one passed this session... Mr. Colfax declines to enter the Presidential canvass....Thos. Hughes has published a letter in the Tribune, asserting that it is absolutely impossible for England to recognize claims for constructive damages ...It is proposed to institute an inquiry in the United States Senate in relation to the sale of arms to France by American Government officials during the German war. The proposition made a great sensation....The copyright question is before Congress....New charters for New York city are constantly introduced at Albany....The Legislature of South Carolina censured its Senators for voting against Civil Rights and Amnesty... In Utah men, women and children vote, and the whole Mormon ticket has been elected ...Chief Justice Chase declines to be a candidate for the Presidency, and is in favor of Senator Trumbull ..A reform printing bill has been defeated in New Jersey....The Senate adopted Mr. Sumner's equal rights bill, by the casting vote of the Vice-President; the General Amnesty bill was defeated ...An exciting political contest is going on in New Hampshire for Governor....R. D. Hubbard is the Connecticut Democratic candidate for Governor....The Senate is debating with warmth the sale of American arms to France... The House has appropriated large sums of money for new public buildings ..Mr. Terwilliger, clerk of the Senate at Albany, whose connection with the State printing has been under investigation, has resigned ..The Republican Convention of Maine has endorsed Grant and Colfax.

Crimes.

LEWIS JUNIOR, a colored man, has been arrested in Scranton, Pa., for the murder of a young woman in Genova, N. Y., in 1868....Joseph F. Mason, the defaulting city treasure of Philadelphia, and Chas. T. Yorkers, Jr., have been sent to the Penitentiary for four years and nine months ..Giuseppe Coldbirn has been stabbed to death in New Orleans, and P. G. Townsend, a policeman, has been shot....John O'Connor, a railway paymaster at Scranton, Pa., has absconded with $10,000.

Fires.

FOREIGN NEWS.

From Great Britain.

WAR risks have been taken on American vessels, in consequence of the Alabama claims apprehensions....A thousand men are at work decorating St. Paul's for the Thanksgiving.... Henry Bouvere Brand has been elected Speaker of the House of Commons ..There has been intense anxiety in London to learn the news from America, respecting our Alabama claims....The London Times is sure the attempt to settle the Alabama claims will be a failure....The Prince of Wales has gone to Windsor....The race between the Cambridge and Oxford boats will take place on the 23d of March....A terrible storm has prevailed along the coast of Ireland, wrecking many vessels... The steamer Electra has been run into in the English Channel. It sunk, and 18 persons were drowned....Kelly, who fired on a policeman at Dublin, has been sentenced to 15 years' hard labor....The Alabama discussion still rages in England....Prayers have been offered in the churches for prevention of war between the United States and England....News has been received in England of the assassination of Earl Mayo, Governor-General of India. He was stabbed by a Mohammedan convict on the 8th inst....Dr. Livingstone has been heard from in London. He was at Ogara on Sept. 30th.

From France.

PROOF of Marshal Bazaine's treachery to the Republic has been obtained....Minister Curtin has had a banquet at Nice on board of the Shenandoah... France will send a first-class diplomatist to Washington. Mention is made of M. Drouyn de Lhuys....Minister Washburne denies that he is about to come home for a vacation. ... It is said the Germans will not withdraw from the six Departments of France they now hold, until March 2d, 1874, even if the war indemnity is paid before that time M. Rouher has been elected to the Assembly from Corsica. ...The Government is negotiating with Germany for a new basis of settlement.

A True Woman.—It is the duty of every true woman to look as beautiful as she can. It is her duty to brighten and gladden the world with her loveliness. If nature has denied them this power, it can be remedied by the use of a perfectly harmless beautifier of the skin known as Geo. W. Laird's "Bloom of Youth," which will remove all discolorations, tan, freckles, sunburns and other cutaneous diseases from the skin, leaving it delicate, soft, smooth, clear and perfectly beautiful. Sold by druggists everywhere. Depot, 5 Gold St., New York.

Watch No. 2226, Stem Winder—bearing Trade Mark "Fayette Stratton, Marion, N. J."—manufactured by United States Watch Co., has been carried by me eight months; its total variation from mean time being only ten seconds per month.—OSCAR M. SANFORD, Utica, N. Y.

8,796 of our $75, 4-Ton Hay Scales sold on trial, and not one returned. THE JONES SCALE WORKS, Binghamton, N. Y.

SPECIAL NOTICES.

RUPTURE CAN BE CURED

without suffering. ELASTIC TRUSSES are superseding all others. Before buying Metal Trusses or Supporters, send for a descriptive circular to the ELASTIC TRUSS CO., No. 683 Broadway, New York.

No Fears need be entertained as to the results, if you use the *White Pine Compound* for your Cough, Weak Lungs or Kidney Troubles. It is certain cure in almost every case.

THE MARKETS.

MONEY AND TRADE AFFAIRS.

NEW YORK, Saturday, February 17, 1872.

THE political flurry in London noticed in our report of last week as affecting the Stock and Gold markets, has not entirely blown over, but there is comparative quiet on the London Exchange, and a recovery in the American Government Bonds. Here there is a corresponding recovery in Governments, but the general stock market is feverish, and speculation rather shifting to the Bearish side; that is, there is more selling for a decline in prices than buying for the Bull account for the rise. One reason for this is the considerable advance in December and January, which pinced many of the stocks higher, perhaps, than the prospects of the Railroads and the condition of the money market justified. Some of the parties to this movement have sold out and are ready to have the market go down, preliminary to a spring rise.

The exciting topic of Wall Street is the attempt of the Erie Ring, who got control of the Hannibal and St. Joseph Road at the last election for Directors, to put a new issue of the Stock on the market, of $5,000,000, thus doubling the capital. The Stock Exchange demanded 30 days' notice before the new Stock could be dealt in, and then on condition of an approved registration. The Erie people had sold the Stock short—that is, in anticipation of springing the 50,000 new shares on the market, and are now compelled to deliver the old stock. They have named the Tenth National Bank as Registrar, but as this Bank, formerly owned by the Tammany and Erie Rings, and now almost entirely by the Erie Ring, is under control of Gould and his colleagues, the Stock Brokers object to the selection, though this difficulty may be removed before the 30 days expire.

General trade continues active, and Money is in fair supply at 7 ₱ cent., although the Bank movement is less strong in Gold and Greenbacks, and as the week closes there are signs that Money is likely to work up to extra rates to outside borrowers.

The following are the comparative movements of the City Banks for the past fortnight:

	Feb. 3.	Feb. 10.
Capital	$87,155,500	$87,155,500
Loans	282,610,100	285,422,200
Gold and Greenbacks	70,551,900	67,888,400
Deposits	220,806,700	221,019,500
Circulation	28,216,700	28,161,700

PRICE OF STOCKS AND BONDS.

American Gold	110¼	N. Y. Central Scrip	92¼
U. S. 5-20's of 1867	111¾	Reading	113¾
U. S. 6s of 1881	115¾	Rock Island	111
U. S. 10-40s, 5 ₱ cts	111	N. West	73½
U. S. New Loan	109¼	Do. Preferred	90¾
N. Y. Bounty Loan	106¾	St. Paul	55¼
Tennessees	65¾	Do. Preferred	76
Virginias, new	57½	Lake Shore	90¾
Missouri Bonds	91	Ohio and Mississippi	43¾
U. S. Currency 6s	114¾	Toledo & Wabash	75¾
Central Pacifics	102¾	Erie	30¾
Union do	91½	Union Pacific Stock	32¾
Western Telegraph	89½	Adams Express	92¾
Pacific Mail	57¼	American Express	64¾
Lake Shore Scrip	86¾	United States Exp's	64¾
N. Y. Central Stock	96¾		

Our table marks the same price for Gold as last week. The Government Stocks have recovered ¼ ₱ cent. on 5-20s, ⅛ on 6 ₱ cents. of 1881, 1½ on 10-40s, and nearly 2 ₱ cent. on the New 5 ₱ cents. which had been most affected by the political trouble on the Washington Treaty. The Railroads are nearly all lower; Union Pacific is down 5 ₱ cent.; the other Western Stocks 1@1½ ₱ cent., except Lake Shore, which is steady at about 90¾@91 ₱ cent. The Virginia State Bonds are 1½ ₱ cent. better; Missouris 1 ₱ cent. lower; the Express Stocks are firm; Pacific Mail 1¼ ₱ cent. lower and Western Telegraph 1¼ ₱ cent. lower.

PRODUCE AND PROVISIONS.

NEW YORK, Friday, Feb. 16, 1872.

Receipts.—The receipts of the principal kinds of produce since our last embrace 37,248 bales of cotton, 1,202 pkgs. dried fruits, 8,507 bbls. eggs, 49,624 bbls. flour, 23,200 bush. wheat, 693,000 bush. corn, 140,500 bush. oats, 61,000 bush. barley, 4,700 sacks grass seed, 2,900 barrels of beans, 6,367 barrels of corn meal, 4,358 bags do., 722 bales hops, 12,160 pkgs. pork, 1,216 pkgs. beef, 23,400 pkgs. cut meats, 22,560 pkgs. lard, 247 kegs do., 20,226 pkgs. butter, 11,023 pkgs. cheese, — dressed hogs, 1,055 bags peanuts, 665 hhds. tobacco, 3,155 boxes and cases do., 6,723 bbls. whisky, 2,967 bales wool.

Beans and Peas.—The arrivals of beans have been fair through the week, but the jobbing trade has been brisk, and an increased shipping trade is going on. Prices, consequently, have been steadily held. Green peas are in fair receipt, and prices are lower. Canada peas are in light stock, and held firmly. The quotations are for prime medium, $2.45@2.55, the latter price difficult to obtain; good do., $2.30@2.40; fair, do., $2.10@2.20; peas at $2.00@2.70; kidney, $3.10@3.25; red kidney, $2@2.25; prime marrowfats, $3@3.10; common do., $2.25@2.40 Canada peas, free in barrels, $1.30. Green peas, $2. Southern blackeyed, per two bushel bag, $2.00@2.65.

Beeswax—There is a light amount coming in and there is a fair sale mainly to shippers. Southern will bring 35c.

Broom Corn.—The market shows no improvement. We append nominal prices:—New hurl, 8@9c.; new green, 5@6c.; new red, 5@6c.; old, 3@6c.

Butter.—The market continues to struggle through a style of trade altogether unlike the activity that belongs to a winter month. Even fine grades have lost a portion of their special favor compared with the earlier part of the month, as the more recent receipts include qualities that suit a large class of buyers who aim for good table sorts without competing with fancy grocers. This even run of quality is about the main stay of the market at present, and should the weather continue cold we can handle stock at the present rate of receipts. There is a fair trade for outside use. Low grades of butter are dull, and there is little prospect of our being relieved from them under grease quotations. We quote pails nearly as before, with the remark that extremes are seldom obtained, or for that matter, sought for. Firkins are now selling more readily than Welsh. Rolls have a fair inquiry.

State dairies, fine, 30@31c.; State dairies, fair to good, 26@29c.; State, half-tubs, good to fine, 32@33c.; State, do., common to fair, 24@28c.; State, firkins, fine yellow, 28@30c.; State Welsh, good dairies, 28@31c.; State do., common to fair, 22@25c.; State do., fresh made, 32@33c.; State, fancy select tubs, 34@38c.; Ohio, good, 18@20c.; Ohio, Central and Southern, 14@16c.; Western, choice yellow, 20@21c.; Western, store-packed, 9@14c.; rolls, good West, 18@20c.; rolls, common to fair, 13@16c.; grease butter, 3@5½c.

Cheese.—Prices have been advanced almost daily until the price of strictly prime has reached 16¾@16¾c., with the jobbing trade paying 17c. At these figures exporters cannot buy, the foreign markets leaving no margin. The cable quotes 70s., but it is claimed that with the asking prices here it is necessary to have an advance of fully 5s. on the above figure to admit of a profitable trade to shippers. The few orders that are here from the other side are closed out on common stock which are obtainable at relatively easier figures. The stocks last week were remarkably light, but the high prices have induced increasing shipments forward from the West, and at the close there is comparatively a fair assortment on sale. The feeling at the close is a firm one, but there is less disposition to advance prices, as the consumption is falling off at the high figures. The exports for the week were only 82,335 lbs., and from Jan. 1st 826,624 lbs, against 2,376,652 lbs same time last year. The quotations are for State factory, fine, 16¼@16¾c.; fair to good do., 15½@16c.; do. common, 13@14c.; State farm dairy, good, 14½@15c.; do. common, 9@12c.; Vermont factory, good, 15@16c.; Ohio factory good to fine, 14½@15¾c.; English dairy good, 13@15c. Fine-apple at 16@18c. for State and 19@20c. for Connecticut.

Cotton.—The market has been upsettled and weak. The demand has been slow from all sources, and the arrivals at the ports are much larger. The offerings are fair, particularly of Gulf cotton, but spinners refuse to purchase to any extent at the asking figures.

	Uplands.	Alabama.	N. Orleans.	Texas.
Ordinary	20	20¼	20¾	20⅝
Good Ordinary	21½	21⅝	21¾	22
Low Middling	22⅛	22⅜	22⅝	22⅞
Middling	22⅛	21	23¼	23½
Good Middling	23⅝	23⅞	24	24¼

For forward delivery there is a moderate business at firm figures. Latest sales are at 22 3-16c. for Feb.; 22¼c. for March; 22⅝c. for April; 23¼c. for May and June, on a basis of low middling.

Dried Fruits.—There is no quotable change in prices for apples and peaches in the market, and only a retail trade doing. Blackberries are quoted ½c. lower for choice.

Apples—Old State, qrs., 7@8c.; Western, new, 8@8½c.; Southern, new, qrs., 7@8c.; do. fine, sliced, 9½@11½c.; new State qrs., 9@11½c.; do., sliced fine, 11@13c. Peaches, peeled, new N. C., 17@18½c.; do., do., do., 15@16½c.; do. E. Sh. Va., 15@16½c.; new unpeeled halves, 7½@8c.; do. quarters, 5½@6c. Plums, 26@27c. Cherries, new, ₱ lb. 29@30c. Blackberries, 13@13½c. Raspberries, 28@29c.

Eggs.—The arrivals are not sufficient to meet the demand, and prices have been advancing. Sales at 30c. for Western; 30@31c. for State; 30@31c. for Pennsylvania, New Jersey and Long Island; 28@29c. for Southern.

Flax.—There is merely a retail call at prices. North River prime, $17@18; do. fair to good, $15@16; Canada prime, $15; do. fair to good, $13. Tow, 2¼@3c.; spinning tow, 8@10c.

Flour.—The market has an improved tone. The arrivals continue very light, and the stock here is steadily decreasing. Exporters have been buying a few lots, but the principal business has been from the home trade, to stock up at the low prices. We advance quotations 10@15c., with a firm feeling at the improvement. We quote at $6.30@6.40 for superfine State; $6.80@6.90 for common extra do.; $6.95@7.05 for good to choice do.; $7.10@7.45 for fancy do.; $6.20@6.40 for superfine Michigan, Indiana, Ohio, Iowa, &c.; $6.75@6.85 for extra do.; $7@7.50 for choice extra do., including shipping brands of round hoop Ohio at $6.85@7, and trade brands of do. at $7.05@7.55; good to choice white wheat extras at $7.50@7.75; Minnesota, fair to very choice extra, at $7.50@8.50; St. Louis at $6.25@7.00 for common to fair extra, and $7.65@9.50 for good to choice. Southern at $6.95@7.20 for extras and $7.65@9.50 for good to choice. Rye at $4@5.15 for common to fine. Buckwheat flour at $3@3.60.

Fresh Fruits.—Apples a shade better, with the resumed demand and the advance in oranges. Swaar and Northern Spy sell quickly when bright and handsome. Russets are moderately offered at $4 for prime. Cranberries sell fairly when sound. Peanuts are something firmer. Pecans salable at late figures.

Apples, good, bbl. $4@4.25; do. selections, $4.50@4.75; do. poor, $2.75@3; cranberries, fine, bbl., $9; do. common to fair, $5@7.50; do. crates, fine, $3@3.25; do. do. common, $2@2.50; oranges, Ia., bbl., $7@8; peanuts, Wilmington, unsh., $2@2.10, Virginia, new, $2@2.20; do. common, $1.25@1.50; hickory nuts, $1.75@2; Pecan nuts, ₱ 8@9½c.

Grain.—Exporters have been buying wheat more freely, and prices have advance 2@8c. per bushel. The offerings are fair at the quoted prices. No. 2 spring in store, $1.56@1.58; No. 1 spring in store $1.60@1.62; Winter red Western, $1.65@1.68; amber Western, $1.63@1.73; and white Western, $1.76@1.79. Rye is quiet at 56@45c. for Western. Oats are offered freely at weak prices. Sales at 52@55½c. for Western and Ohio, in store and afloat. Barley is held firmly without much trade. Sales at $1 for four rowed State $107@110 for Canada West. Corn is held firmly with a fair export trade. Sales at 72@73c. for new Western mixed afloat; 73¼@74c. for Western yellow; 77c for white Southern.

Hay and Straw.—The demand is slow, and, with a fair amount of stock offering, prices are lower. Shipping hay at $1.20@1.25; retail qualities, $1.35@1.65; salt, 60@70c.; clover, 60@85c. Long rye straw $1.05@1.15; short rye, 85@90c.; oat, 65@85c.; wheat, 60@70c.

Honey.—The stock is well sold up, through the recent low prices. What remains of white clover is quoted at 22@25c.

Hops.—Business has been dull. Mediums and choice stock is sought after at full prices, but stocks of these grades are small. Common offered freely at late prices. We quote:

New Yorks, growth 1871, 25@65c.; Eastern do. 1871, 25@60c.; Western do. 1871, 25@60c.; yearlings do. 1870, 10@30c.; olds do. 1869, 10@15c.; old olds do. 1868, 8@12c.; Californians do. 1870, 15@30c.; Californians do. 1869, 9@15c.; Bavarians, 75c.; English, 65c.; Belgians (nominal), 55c.

Miscellaneous.—Linseed oil, 88c., casks. Spirits turpentine, 83½@84c. Carolina rice, 7¾@0. Ashton's salt, $3. Common lime, $1.35; lump do., $1.90. Eastern spruce lath, $2.80. Layer raisins, $2.60, a decline of about 40c. per box. Adamantine candles, 15@16c.

Poultry and Game.—Dressed poultry is very steady, showing a further advance. For the first time this season prices have gone above 20c. for turkeys. Western arrives frozen but sound, and, with the moderate supply, sell at good prices.

Turkeys, Western, good, 16@18c.; do. poor and frozen, 13@16c.; do. State, 17@18c.; do. Jersey, 20@21c.; Ducks, Western, 16@18c.; do. poor and frozen, 12@16c.; do. State and Jersey, 10@12c.; Geese, Western, 10@12c.; do. poor and frozen, 10@12c.; do. State and Jersey, 14@16c.; Fowls and Chickens—Western good, 15@17c.; do. poor and frozen, 12@14c.; do. State, 16@18c.; do. Bucks Co. and N. J., 18@20c.; capons, 25@28c. Fowls and chickens—Live, State and N. J., 17@18c. do. Western, 15@16c; roosters, 10@12c.; ducks, per pair, 75c.@$1.50. Geese—Western, $1.50@1.75; do. Canada, $1.75@2; do. Jersey $3@3.50; turkeys, 18@19c.

GAME.—There are few lots of importance for quotations, as there will not be time for further shipments before the limit runs out. Quail are higher. A good many are stored away, but owners keep up the idea of scarcity by selling few at a time. Grouse in demand, and firm. Venison nominal. Antelope do not find favor in this market. Quail, sound, ₱ doz., $2.00@2.62; do. soft, $2@2.25; Grouse, ₱ pair, 75@80c.; Partridges, Eastern, 75@90c.; do. State and Western, 90@$1.25. Rabbits, 40@50c. Hares, 30@40c. Venison, whole, ₱ lb., 8@10c.; do., long saddle, 10@12c.; do. short saddle, 12@13c.; do. Minn., 14@15c. Buffalo, hind saddles, 4@7c.

Provisions.—The market for pork shows very little change. The inclination generally has been to work off supplies promptly at the quoted prices, but there are few buyers. The arrivals of hogs at the West have been large. Holders refuse to name lower prices. The quotations are $13.37 for old and $14.25@14.37 for new. Sales of new for March at $14.12, and for June at $14.40. Extra prime, $12; old Western prime mess, $11.50; new do., $14. Dressed hogs sell at 5¾c. for Western and 6¾@6¾c. for city. Middles have been bought up freely at firm prices, with packers at the close somewhat indifferent about selling. Sales at 7 7-16c. for long clear, 7¾c. for short clear. Cut meats meet with a fair jobbing trade at 8¾@9¼c. for hams in pickle, 8¾@8¾c for do. in salt, 5¾@6c. for shoulders in salt and in pickle. Smoked meats meet with a fair trade at 11@13½c. for hams, 6½@7c. for shoulders, 8@8½c. for clear rib. Lard is steadily held with a fair business from both exporters and dealers. Western steam, prime, 9 11-16c.; No. 1, 9¼@9¾c. Sales for March 9¾c., for April 10c., for June 10¼c.; City at 9¾@9¾c. for prime; steam steadily held at 9¼@9¾c. for prime. Beef is selling in small lots only at $8@0 for Western new, $11@13 for extra mess, $15@17 for prime mess in tcs., and $19@21 for India mess. Beef hams bring $23@26 for Western. Tallow is offered freely at 9@9¼c.

Seeds.—The shipping trade in clover has fallen off materially, and to move the increased stock much lower prices have been submitted to. Sales of Ohio at 9¾@10, and Indiana and Michigan, 10¾@10¾c.; a small lot Timothy brought $3.62½.

Tobacco.—A few small shipping orders are on the market for Kentucky leaf, and added to a little better home trade, there is a fair amount of life. The arrivals are increasing, and there is, perhaps, rather more disposition to realize, but no important concessions are offered. Seedleaf is still hard to sell, most parties inclined to wait the effect of increasing arrivals of new. A fair business is going on in the best grades of Havanas, at steady prices.

Vegetables.—There is no inquiry ahead for consumption, and prices are unchanged in bulk. Early Rose and Goodrich for seed in double heads, $2.25@2.50. Onions plenty and cheap.

Potatoes, Early Rose, bbl., $2.12@2.37; P. Blows, $1.75@2; Prince Albert, $1.75@2; Monitor and Goodrich, $1.25@1.50; Jackson, $1.25@1.50; Dyright, $1.25@1.75; Nova Scotia, $1.75; sweet Del., $3.75@4.00. Onions, red & yellow, $1.50; white, $2.50@3; Conn., 100 strings, $2.50@3. Garlic, per 100 bunches, $20@22. Turnips, Russia, bbl., $1.25; flat, $1@1.25. Cabbages, per 100, $5@7. Hubbard squash, per bbl., $4; marrow, $4. Beets per 100, $1.25. Carrots per 100, $1.50.

Whisky.—Western plenty, and selling slowly at lower prices. Sales at 91½c.

Wool.—Business has been less spirited in fleeces. Manufacturers are anxious to buy, and will pay last week's figures promptly, but they find holders more indifferent, in view of the steadily decreasing stock. A number of the dealers are nearly out of this grade of stock. An advance of 5c. is claimed in instances, the quotations being 80 to 85c. for good Ohio. Pulled have been bought up to a liberal extent. The stock of this description is running low, and holders are not disposed to force business, even at the improved figures. Texas and California grades sell moderately well at steady figures. A very fair business is going on in the best descriptions of foreign, with prices strong. Latest sales are at 80c. for prime Ohio; 83½c. for Ohio sorts; extra pulled, 76@78c.; super pulled, 80@82c.; Texas, 31½c.; choice medium Texas, 55c.; Oregon, 60c.; full clip California, 35½@40c.; Cape, 43@48c; unwashed Mestiza, 34½@38c.

COUNTRY CHEESE MARKETS.

Little Falls, N. Y., Feb. 17, 1872.

There was not much doing in the Little Falls cheese market for the week ending Feb. 17. Small lots of farm dairies continue to come in from day to day, and are bought by resident dealers at various prices ranging from 10 to 15c. according to quality. We hear of no transactions in factories. The advance in prices in New York to 17c. has brought about a good feeling among dairymen, and the anticipation now is that the early cheese will go off at good prices.

We have advices from abroad for the last week in January. Our London Correspondent says there is a fair demand for fine and low qualities of American and English cheese. American extra fine is quoted at 62@67s. The other descriptions of cheese sell as follows:—New English Cheddar, 70@80s.; Wiltshire double, 56@70s.; Cheshire medium, 56@60s.; fine, 74@84s.; Scotch, new, 66@72s.; Dutch cheese—Edams, 60@69s.; Gouda, 46@56s.; Derby shape, 50@60s.

In Butter there is a good demand for fine European, but secondary is not saleable. The quotations are as follows:—Clonmells, 100s. to 130s.; Corks, 128s. to 130s.; Normandy extra, 144s. to 156s.; Canadian, 70s. to 112s.

The corresponding prices in London, last year, for butter and cheese, were as follows:—American cheese, new, 80s.; Clonmells butter, 150s.; Corks, 150s.

The weather during the early part of the week in Herkimer was mild and pleasant, but on Wednesday there was high wind and snow.

LIVE STOCK MARKETS.

NEW YORK, Feb. 16, 1872.

Now that the Lenten season is upon us, there is less call for meat and more demand for fish, eggs, etc. The lighter supply of cattle causes no advance in price, nor is there any felt deficiency in numbers. The weather has been good, and no severe snows have kept the trains back. There is still complaint of insufficient rolling stock on the roads for bringing forward all of the live stock. Sheep continue in good request, and appearances indicate a further advance. Hogs are coming forward sparingly, and still have de-

clined in price. The principal packing trade is now over, hence there are fewer buyers of dressed hogs. There is still some prospect of a union upon higher freights, and all the roads are likely to come into the arrangement, abolishing the drawback system.

TOTALS LIVE STOCK FOR THE WEEK.

	Beeves.	Milch Cows.	Calves.	Sheep.	Hogs.
This week	6,304	119	777	27,504	29,230
Last week	8,408	146	872	26,553	32,686
Correspond'g w'k '71	6,923	53	978	24,195	13,934
Average, '71	7,187	88	2,301	25,132	25,177

Beeves.—A falling off of 2,100 cattle is a good deal for a single week, and in ordinary times would have produced a scarcity and caused a marked advance in prices. Now, however, at the beginning of Lent, the supply is ample, and there is almost a weakness observable. There was the moderate supply of 4,106 head on sale last Monday—115 cars at Communipaw, 110 at 100th street, and 30 at Weehawken, and the market was somewhat active, all selling, and at the same prices of the previous market; but, since then, although we have had only 1,631 bullocks on sale, the market is inactive, and the tendency toward lower rates. And still, prime 8@8¼ cwt. grades are worth 12¼@13c., with good, fat 7½ cwt. cattle at 12c., and medium steers at 11¾c. Thin Ill. and fair to good Texans sell at 10¾@10¾c., with a lot of little, 4½ cwt. Cherokees at $40 each. Dry cows are worth 8@9c., and bulls 4¾c. ₩ lb, live weight. A few of the latest sales were, 5 cars Mo. cattle, 6¾ cwt., at 10¾@11c.; 11 cars Ill., 7¾@7¾ cwt., at 11¾12c.; 5 cars, 7¾ cwt., at $98 each; 4 cars fat Texans, 7¼ cwt., at 9½@10c. There is a possibility that, in view of the lighter run of cattle on account of Lent, the market may improve. This is sometimes the case, drovers holding back so strong, for fear of poor markets, that they produce the opposite.

The following are the prices at the close of the market:

	This week. Cents.	Last week. Cents.
Choice bullocks, ₩ lb	12¾ @ 13	12¾ @ 13
Good to prime	11½ @ 12	11½ @ 12
Medium	11 @ 11½	11 @ 11½
Ordinary	9½ @ 10½	9½ @ 10½
Poorest grade	8 @ 9	8½ @ 9½
Average of all sales	11¼ @ —	11¾ @ —

Hogs.—Receipts of live are lighter, but we are having more dressed hogs, 9,879 the past week. There is very little change in live from the prices of the previous week, viz., 5¾@5¾c.; but all kinds of dressed have declined, and there is less variation in the different weights. City dressed are quoted at 6¾@6¾c.; few fancy pigs selling at 6¾c., while Western pretty uniformly 5¾c., one car very fancy Mich. excepted, 403 lbs., at 6¾c.

Milch Cows.—The supply is still in excess, and trade is slow. Were the cows of better quality they would sell quicker. Many of those sent in are sort of refuse animals, such as farmers are very willing to part with. They sell at $50@60 each, with a grade a little better at $65. One lot of 20 averaged $90, with 4 sold at $52.50 per head. Dealers call the prices $2@3 per head lower than they were one week ago. A few good milkers brought $80, and some quite poor $40 each.

Sheep and Lambs.—The arrivals do not vary materially from the previous week, nor is there much variation in price. The markets rule strong and active, kept so more by the value of their skins than by what the mutton brings. Sheep average about 7¾c. ₩ lb, or $5@6.25 per head, though fat lots go at 8@8¾c., and choice to extra line at 8¾@9¼c., while poor sell at 6½@7c.

Veal Calves.—Dressed calves are declining, but live are no lower as yet, only they point towards a decline. The market is well supplied with dressed calves, and as many live are sent in as find ready sales at the prices. The best sell at 11c., 10 head, 140 lbs. average, going at that price. In lots they are worth 10¾c., a dealer selling 200 fat Bucks Co., Pa., 135 lbs., at 10¾c. Hog-dressed vary from 7@9c. for fed, and 12@14½c. for fair to fat milk veals.

New Advertisements.

CARHART'S
PATENT TWO-HORSE
Pulverizing Cultivator

Was Awarded the First Premium at State and County Fairs in 1870 and '71.

It is superior to the best Wheel Cultivator.
The price is only Twenty Dollars.
The draft is reduced nearly one-half.
The depth you wish it to run is regulated without the use of wheels.
It can be drawn close to a tree or plant without injuring it.
It is not disturbed by short undulations of earth, like the Wheel Cultivator, but pulverizes, levels and fits the ground for the Mowing Machine better than any Cultivator in use, and can be used for more purposes than any other implement on the farm.

CAYUGA LAKE RAILROAD.
STATE OF NEW YORK
Seven Per Cent.
FIRST MORTGAGE
GOLD BONDS.

THIRTY YEARS TO RUN, AND ISSUED FOR $20,000 PER MILE.

This road forms the shortest and most direct route from the great Anthracite and Semi-Bituminous COAL fields of Pennsylvania into the central part of this State, and will run in connection with the New York Central road, which it crosses at Cayuga Bridge. Traversing as it does the finest and most populous agricultural district, generally known as the "Garden of the State," its local traffic will be large, but its greatest source of revenue will be from its COAL business. The road is being rapidly built, and will be in active operation during this year. From our knowledge of this enterprise, and after the most thorough investigation, we most confidently recommend the Bonds as a safe investment. We offer for the present the Bonds at 90 and accrued interest in currency.

LEONARD, SHELDON & FOSTER,

In Denominations of $1,000, $500 and $100.
OF THE

Logansport, Crawfordsville and Southwestern Railway, of Indiana.

Price 95 and Accrued Interest.

This Road, 92 miles in length, 70 of which are in actual operation, runs southwesterly from Logansport to Rockville, passing centrally through five of the wealthiest and most productive counties of Indiana, hitherto without railway facilities, and penetrating for Twelve Miles at its Southern terminus the celebrated Block Coal Fields of Parke County, it affords the shortest existing outlet to Chicago, Toledo, Detroit, Fort Wayne, Logansport, and all other intermediate points for the Block Coal (now in such large demand), Lumber, Cattle, Grain, and other surplus products of this rich Agricultural and Mineral section of the State.

For the present we offer a limited number of these First Mortgage Bonds at 95 and Accrued Interest in Currency, or will exchange them for U. S. Bonds or other marketable securities at the rates of the day.

At the above price these Bonds yield to the investor 60 per cent. more income than the Bonds of the United States, and we unhesitatingly recommend them to all classes of investors as offering the most ample security and liberal returns.

Further and full particulars, with Pamphlets and Maps, furnished by us on personal or written application.

JONES & SCHUYLER,

NOT ONE FAILED IN 20,000.

"THE GREATER INCLUDES THE LESS."

Note extra steel and durability as contrasted with old V outline on M tooth. After wearing teeth out they may be recut or sold to some admirer of the old V friction process, used by all other Saws.

BOYNTON'S LIGHTNING SAWS.

I submit fair samples of letters daily received from ordinary farmers. Occasionally there is a man who does not know how to set or file any saw; uses one set for dry beech to saw soft wood without widening set. Such a man may learn to use saws, or employ some one who knows how to sharpen and set; but there is some chance that he will go back to chopping one cord per day when a saw could as easily saw TEN if he knew how. For the benefit of such, I indelibly engrave full directions on each cross-cut saw-plate. Many will thus learn to use any saw. For sawing hard wood the points should not be filed thin but left about as when sent out. I am now prepared to fill all orders, having doubled capacity recently. I regret delay many have suffered.

BELLEVILLE, Ontario, Can., Jan. 20, 1872.
E. M. BOYNTON, 80 Beekman St., N. Y.:
Dear Sir:—I received your Lightning (Cross Cut) Saw in due time, and am perfectly satisfied of its superiority. We have cut one cord of Beech wood in 20 minutes. My neighbors are quite anxious to get saws, and I therefore send you check on Jay Cooke & Co. for the following quantity of Lightning Saws.
S. S. POTTER.

NEW YORK, Jan. 18, 1872.
E. M. BOYNTON
Dear Sir:—Your saw that I purchased has cut several hundred cords of the hardest kinds of Beech, Maple, Oak and Hickory timber at a rate of speed and cost of cutting saving more than one-half the time and labor—common men sawing down the trees and cutting about one cord per hour with a Lightning Cross Cut. From practical experience with men and other saws, I am certain of a gain of one hundred per cent. in speed and cost over other saws. I think the Lightning Saw is worth many times its price to the farmer and wood-cutter. Indeed, it is a great invention.
A. BRAYTON,
Smith's Basin, Washington Co., N. Y.

A 6-ft. Cross-Cut and a Wood Saw shipped on receipt of $6.

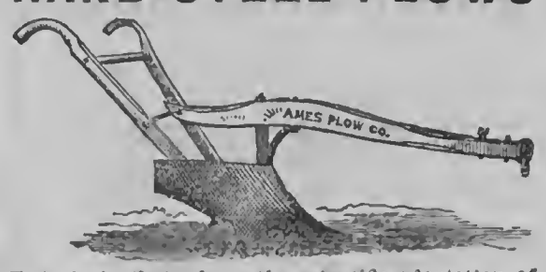
SESSIONS & KNOX'S
PATENT
HARD STEEL PLOWS



Embody in their shape the scientific adaptation of natural lines embraced by KNOX'S PATENT, and have extra qualities of hardness, each piece of metal being made by a process that converts about one-third on each side into steel, and allows it to be hardened as much as fire and water can make it, while the center remains soft or flexible. This gives them a toughness that avoids the liability of breakage so general with other plows, and a surface better adapted to slide through the soil, which reduces the amount of power required and further adds to durability.

These Hard Steel Plows received the highest premium, $20, awarded to Plows at the Vermont State Agricultural Fair, Sept., 1871.

Messrs. Sessions & Knox were awarded the highest prize by the New York State Agricultural Society, October, 1871.

Awarded the highest prize, a Silver Medal, by the New England Agricultural Society, September, 1871.

ALSO,

KNOX'S PATENT AND IMPROVED EAGLE,

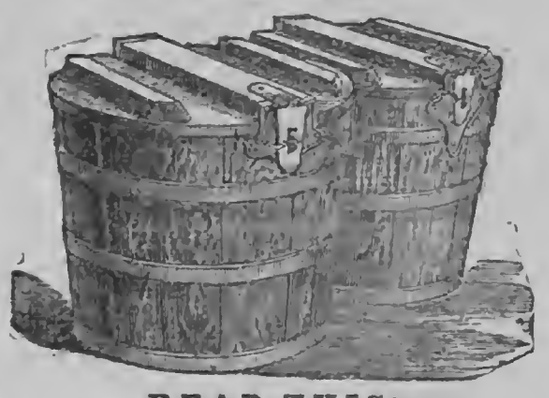
FARMERS, DAIRYMEN AND BUTTER BUYERS!

PACK YOUR BUTTER
IN
WESTCOTT'S
RETURN BUTTER PAIL

Approved and recommended by the leading authorities of our country on dairying, and acknowledged by all butter dealers to be the very best package in use.

Butter packed in this Pail brings **5 to 10 cents more** a pound in the New York City market than the same quality in any other package.



READ THIS:

NEW YORK, Nov. 15, 1871.

We, the undersigned, Produce Commission Merchants of the City of New York, consider Westcott's Return Butter Pail, manufactured by Silsby Bros., Belmont, N. Y., *the best package in the market.* It is our experience that Butter packed in this Pail *sells more readily and commands a higher price* in this market than in any other package, and we heartily recommend its general use by the dealers, dairymen and butter buyers who ship to this city.

Respectfully,
(Signed by 45 leading Commission Merchants.)

The Westcott Return Butter Pail meets my approval as a good butter package. It is one which I always feel safe in recommending.
X. A. WILLARD,
Dairy Editor Moore's Rural New-Yorker.

Dairymen, send for a Circular! Dealers, send for a Price List! We are the sole manufacturers of **Westcott's Return Butter Pail,** and also manufacture very extensively Butter Firkins, Half-Firkin Tubs, 25-pound Butter Pails, Well Buckets, &c., &c.

IOWA FARMING LANDS

THE CHICAGO, ROCK ISLAND & PACIFIC RAILROAD COMPANY

Is now offering for sale to actual settlers more than

500,000 ACRES

of the finest and most desirable Farming Lands in the West.

The lands are chiefly situated along the line of its railroad between the cities of Des Moines and Council Bluffs, and are the most fertile and accessible lands offered for sale at low prices in the State. Prices will range from $5 per acre, the average being about $7 or $8.

Sales are made either for cash, or on short or long time, so as to suit all purchasers. Full warranty deeds given.

EXPLORING TICKETS,

entitling the purchaser of land to a credit of amount paid for fare upon his land, are for sale at the principal ticket offices of the Company.

For pamphlet (with map), or any information regarding the lands, address

J. L. DREW, Land Commissioner, Davenport, Iowa.

NORTH CAROLINA

LAND COMPANY,

(Chartered by Special Act of the Legislature in 1869)

Offers for sale 200,000 acres of best Farming Lands, near Railroads, Rivers and Towns, with good houses and improvements. Prices, from $2 to $10 per acre. Also, 300,000 acres of Timbered and Grazing Lands. Prices from 50 cents to $2 per acre. Also, numerous Mineral and Mill Properties, Water Powers, &c., at various prices. The *President* of this Company has been appointed *Commissioner of Emigration* by the Legislature of North Carolina, and by virtue of his office is required to give all needful information to emigrants. No other Company or Agency has the *indorsement* and *sanction* of the State. Apply for information and Circulars.

GEO. LITTLE, President.
WM. SCOTT, Secretary, Raleigh, N. C.

1,500,000 ACRES OF THE

RICHEST FARMING LANDS

IN THE WORLD,

For Sale to Actual Settlers.

NEOSHO VALLEY, KANSAS, MISSOURI, KANSAS, AND TEXAS RAILWAY CO.

CARS NOW RUNNING 400 MILES.

The Lands offered by this Company are mainly within 20 miles of each side of the road, extending 170 miles along the NEOSHO VALLEY, the richest, finest and most inviting valley for settlement in the West. One-third of the labor required at the East in the culture of farms will insure here double the amount of crops.

PRICE OF LAND.—$2 to $8 per acre; credit of ten years' time.

TERMS OF SALE.—One-tenth down at the time of purchase. No payment the second year. One-tenth every year after until completion of payments, with annual interest. For further information, address ISAAC T. GOODNOW, Land Commissioner, Neosho Falls, Kansas.

FARM AND MILK ROUTE for Sale. Contains 125 acres. In and adjoining the flourishing village of Baldwinsville, which lies upon the Oswego and Syracuse R. R., 12 miles from Syracuse, and contains about 3,500 inhabitants. The best of schools, &c. Elegant two-story frame house, with two wings; good and spacious barns and sheds; splendid location; well watered and fenced; adapted to grass or grain; young orchard, and variety of fruit. Soil, sandy loam. Terms easy. For further particulars, address JOHN W. SIMMS, Baldwinsville, Onondaga Co., N. Y.

A READY BUT RUDE REPLY.

Minister.—My boy, you shouldn't be so wicked as to fish on Sunday.
Boy.—I don't think its wicked, 'cause I don't catch any fish!

A Safe and Profitable Investment.

BANKING HOUSE OF JAY COOKE & CO.

The Treasury next month will pay off Forty Millions additional of the 1862s, and holders of the same should consider whether it is not best to exchange them at once for a BOND OF EQUAL SAFETY, and which will secure them an increased annual income nearly ONE-THIRD GREATER than they obtained on their 5-20s.

The 7-30 GOLD BONDS OF THE NORTHERN PACIFIC R. R. Co., which we offer at PAR and accrued interest in currency, have been sold rapidly for cash, and in exchange for 5-20s, and we commend them to our friends and the public with the same confidence we did the Government Loans.

They are secured by a FIRST and ONLY mortgage upon 2,000 MILES OF RAILROAD, ITS EQUIPMENT AND EARNINGS, and, in ADDITION, upon 500 acres of land to every $1,000 Bond, or 23,000 acres to every mile of road.

The extent of this land is greater than ALL THE NEW ENGLAND STATES AND MARYLAND, and its value, taken at the average at which other railroads have sold their land grants, is OVER THREE HUNDRED MILLIONS OF DOLLARS, or TREBLE the possible cost of the Road and issue of the Bonds.

The Bonds are thus a Real Estate Mortgage and Railroad Bond COMBINED upon property three times greater than the liabilities of the Company.

No Bond could be more secure.

Northern Pacifics are issued in denominations from $100 to $10,000, coupon and registered, and their heavy sales in this country and Europe assure the early completion of a large portion of the road.

The Bonds are FREE FROM U. S. TAX, have 30 years to run, principal and interest payable IN GOLD at the Banking House of Jay Cooke & Co.

All marketable securities received in exchange without expense to the investor, at their highest current value.

JAY COOKE & CO.,
New York, Philadelphia and Washington.
☞ For sale by Banks and Bankers generally throughout the United States and Canada.

"FAMILY FAVORITE!"

THE

WEED. WEED.

The most perfect, reliable and generally useful machine in existence. For the family of the farmer or mechanic, where the work required of a sewing machine ranges from the heaviest garments of men's wear to the most delicate and ornamental fabrics for ladies and children, it has proved itself thoroughly efficient and entirely satisfactory. Of unequaled simplicity and completness of construction, capable of being learned and operated with one-fourth the usual expenditure of time and labor, with a capacity for quantity, quality and variety of execution beyond its competitors, and a reputation for durability and reliability known and appreciated by thousands, it is offered to the people for the most critical inspection and comparison, with confidence that its obvious merits cannot fail to convince the careful examiner of its superiority. Manufactured by the

WEBSTER'S PATENT BUTTON-HOLE WORKER.
Patented June 27, 1871.
One of the most important inventions of the age!
The most perfect Button-Hole Worker ever invented!
So simple that a child can work a more perfect button-hole with it than the most experienced hand can work without it. Every stitch is taken with the most perfect mechanical accuracy, is used entirely independent of the sewing machine, and will last a life-time. Does away with pricking the fingers, straining the eyes, and with imperfect and irregular worked button-holes. They give universal satisfaction. Ladies who use them say that they are worth their weight in gold. Over 11,000 sold during the first week of their introduction. The most liberal inducements offered to the trade. Dry Goods and Fancy Goods Merchants find it an excellent selling article. Local and traveling agents wanted everywhere.

Samples and terms, with full directions for use, sent prepaid on receipt of 50 cents. Orders by mail receive prompt attention. Address

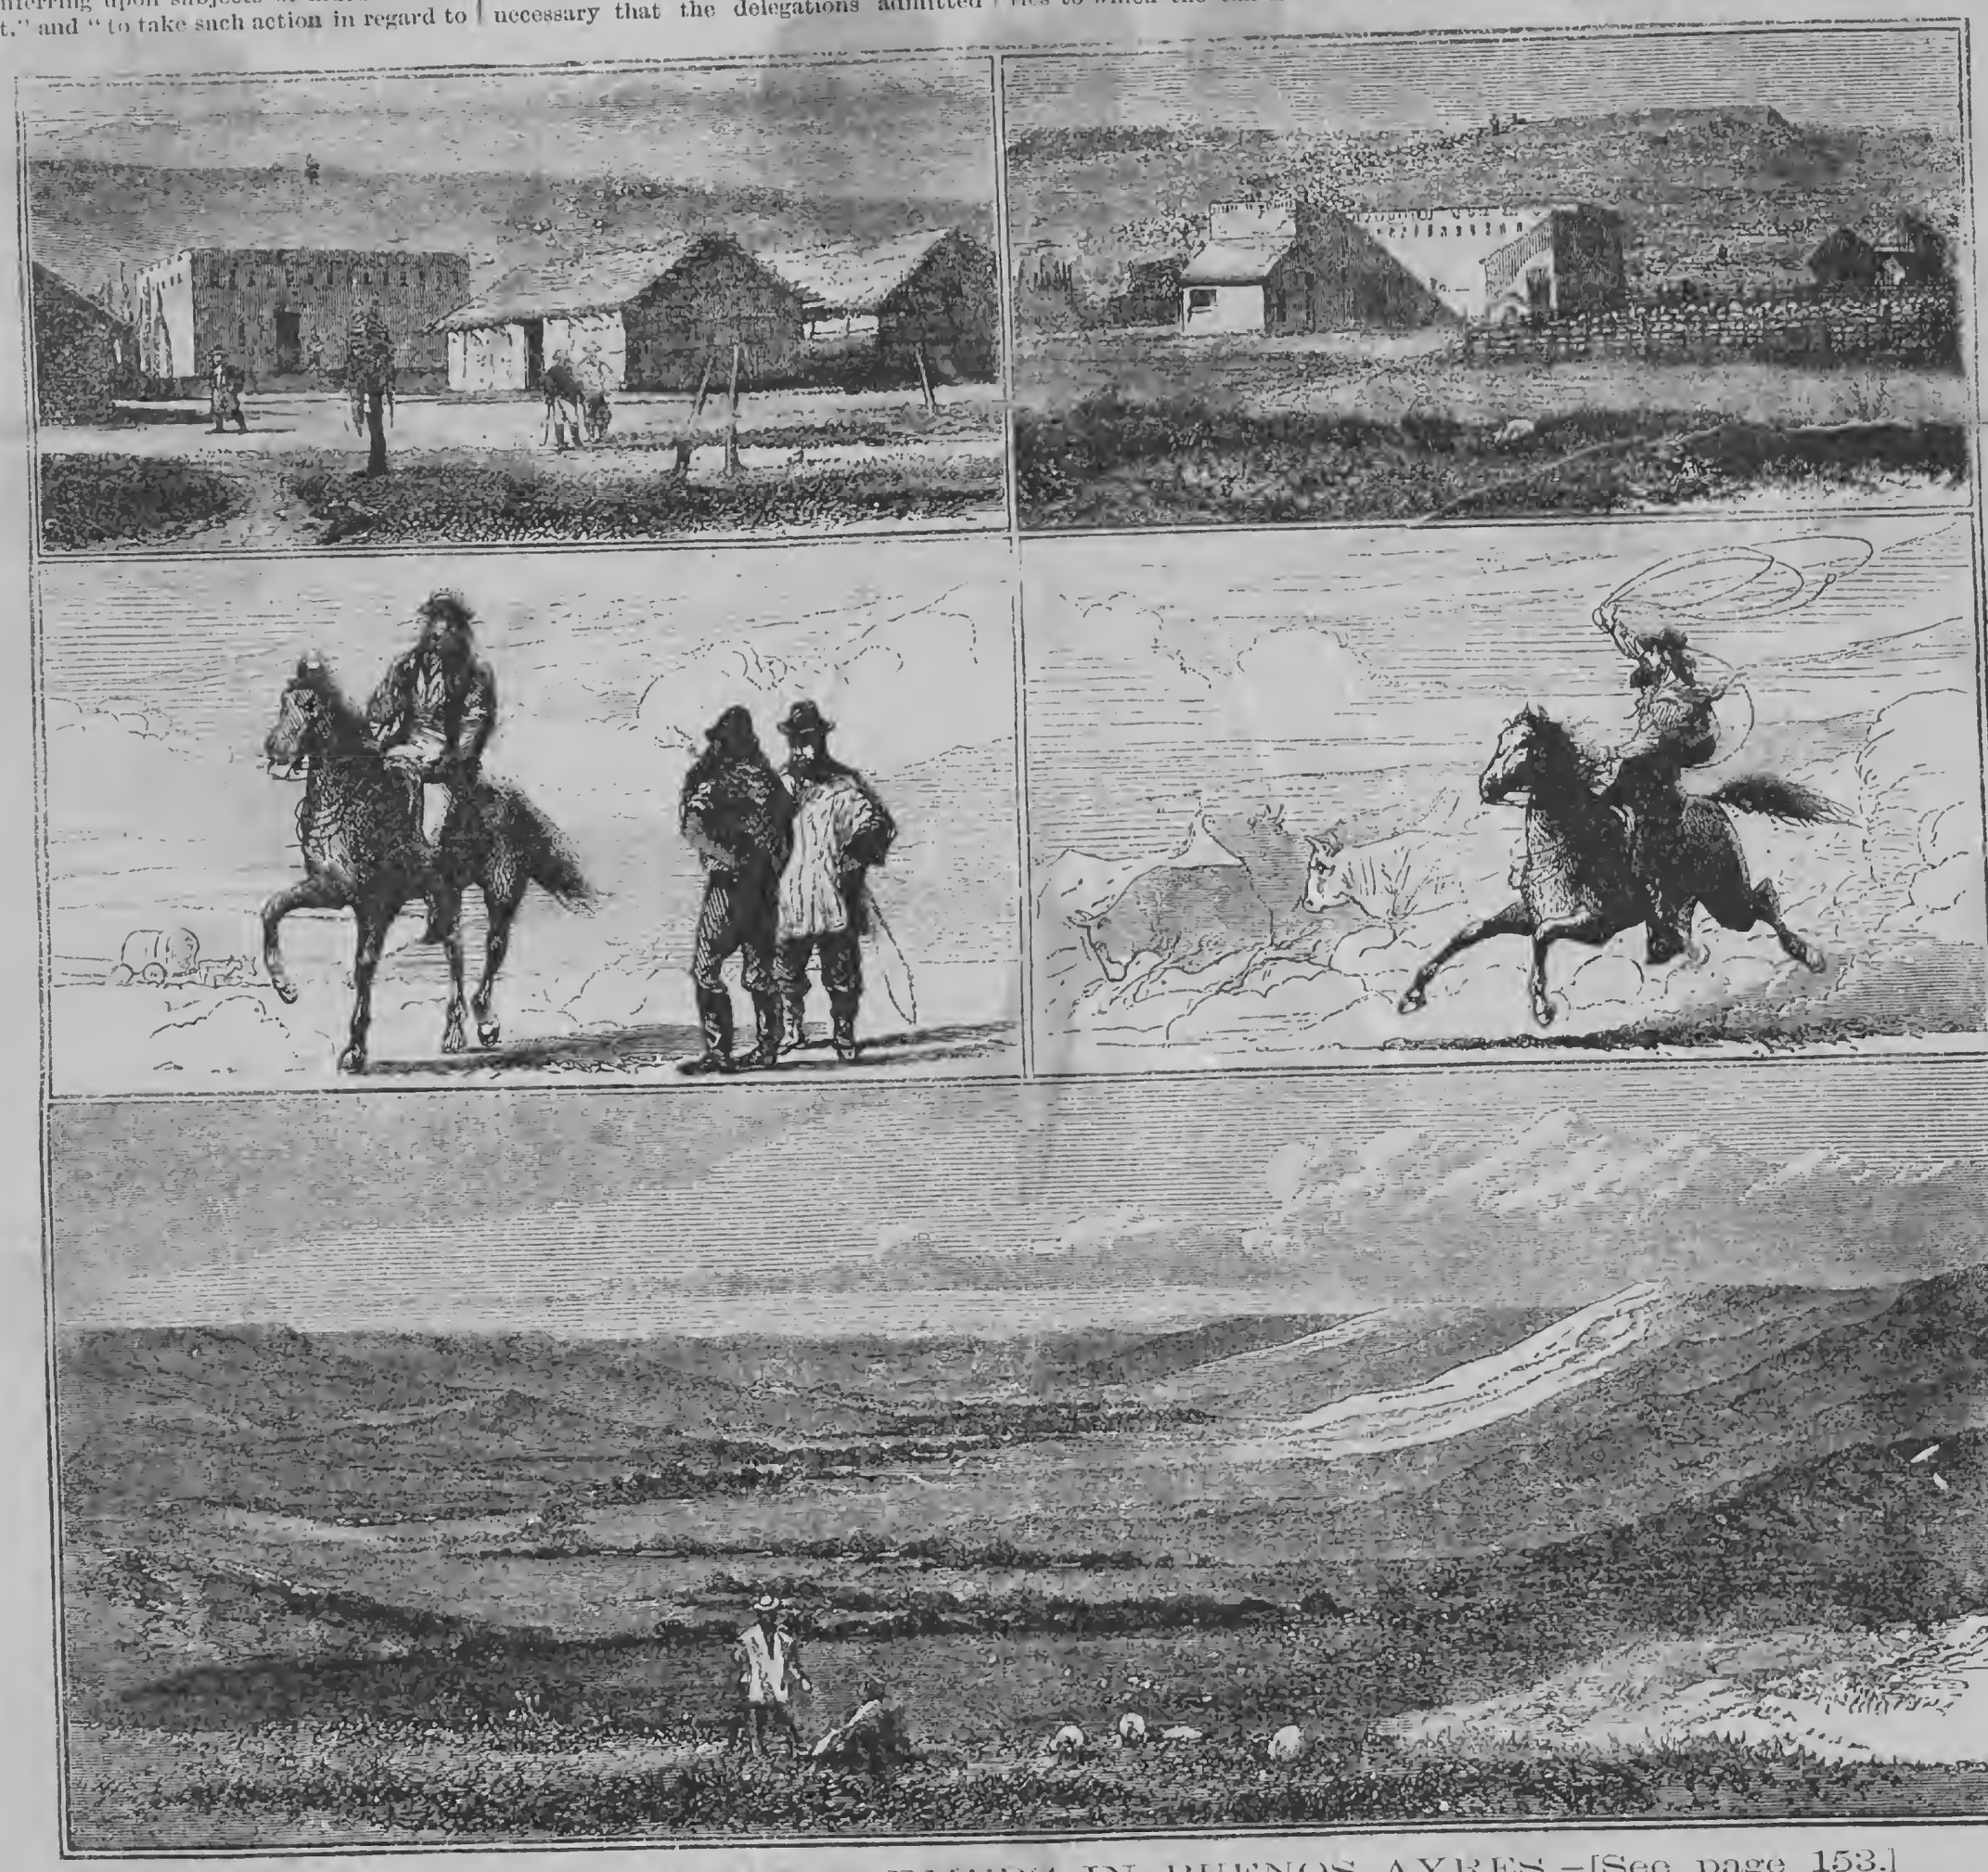
NATIONAL AGRICULTURAL CONVENTION.

At the Department of Agriculture, Washington, D. C., Feb. 15, 1872.

WE attended this Convention, called by the Commissioner of Agriculture, of delegates from State Agricultural and Horticultural Societies, Boards of Agriculture and Agricultural Colleges, "for the purpose of conferring upon subjects of mutual interest," and "to take such action in regard to the interests of Agriculture" as they might "deem expedient." There was a goodly gathering from nearly all the States in the Union. We soon learned that the Commissioner was fixing things so as to run the Convention according to his notions of propriety. He called it to order at 10.30 A. M., the 15th, and made a speech, to which little exception could be taken, stating that the object of the Convention was to consult as to the best method of co-operation among Agriculturists, and especially in the relations of the Department to the Agricultural Colleges. He also announced that it was necessary that the delegations admitted should be such only as the call named, to wit:—Those from State Agricultural and Horticultural Societies, Boards of Agriculture and Agricultural Colleges. Professor BOWMAN of Ky., was elected temporary Chairman, and Rev. Mr. CALDER of Pa. Secretary. Then began the struggle for the admission of delegates from Societies not included in the call. Dr. LORING is a ponderous body. He represented the New England Ag. Soc. His voice absorbed all other voices, which seemed only to swell the volume of his own. He tortured the Commissioner by asking for a list of the Societies to which the call had been sent. He wanted to know whether, having come with others of the New England Society in obedience to the call, he and his colleagues were to be left out in the cold; if so, he insisted upon knowing why. There was a long discussion or colloquy upon the subject, resulting in a call of the States, and the delegates present from the different States responded with their names and those of the organizations they represented.

States Represented.

The call showed that delegations were present from Alabama, Arkansas, Connecticut, Delaware, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Maine, Maryland,



AN ENGLISH FARM AND FARMERS IN BUENOS AYRES.—[See page 153.]

Massachusetts, Michigan, Minnesota, Montana, Missouri, Nebraska, New Hampshire, New Jersey, New York, North Carolina, Ohio, Pennsylvania, Rhode Island, South Carolina, Tennessee, Texas, Utah, Vermont, Virginia, West Virginia, Wisconsin, and District of Columbia. Several of these delegations represented organizations not included in the call of the Commissioner. After the call of the States an effort was made to admit all the gentlemen present representing Industrial Organizations and Agricultural Colleges, but it failed, and the whole matter was referred to a Committee on Credentials, consisting of one delegate from each State represented. A similar Committee on Organization was appointed.

Permanent Officers.

The Committee on Organization reported for permanent officers of the Convention:

President.—Dr. Geo. B. Loring of Mass.

Vice-Presidents.—T. G. Reid, Ala.; T. Smith, Ark.; E. H. Hyate, Conn.; H. Fielder, Ga.; W. H. Purnell, Del.; J. O. Cunningham, Ill.; T. S. Dowling, Ga.; E. B. Shankland, Iowa; Joseph Denison, Kansas; J. B. Bowman, Ky.; S. L. Goodale, Me.; A. B. Davis, Md.; W. S. Beard, Mass.; T. C. Abbott, Mich.; Col. W. S. King, Minn.; H. V. Baily, Mo.; D. H. Wheeler, Neb.; General Nathead, N. H.; G. H. Cook, N. J.; Ezra Cornell, N. Y.; N. N. Woodford, N. C.; J. P. Robinson, Ohio; H. V. McAllister, Pa.; G. F. Wilson, R. I.

Rec. Sec.—C. W. Murtfeldt of Mo.

Cor. Sec.—J. R. Dodge, of the Agricultural Bureau.

The report was adopted.

The Committee on Credentials reported in favor of admitting all delegations that had arrived, and they were so admitted.

We have thus given, as nearly in detail as is necessary, the manner of, and results in, organizing the Convention.

The Agricultural Department—Topics for Discussion.

The Business Committee, through its Chairman, the Commissioner of Agriculture, presented a series of resolutions for the action of the Convention, the substance of which was that Agricultural Colleges, established under the Congressional Land Grant of 1862, should be distinctively agricultural, should adopt the manual labor feature, and should admit males and females as pupils; that these schools, and agricultural and horticultural societies, should co-operate, and the Department of Agriculture should co-operate with all. These resolutions seem to have originated in the Department of Agriculture, and embrace the main business it had to present to the Convention. But this did not seem to be regarded of practical importance by the Convention.

The Equalization and Increase of Land Grants

to Agricultural Colleges evidently was first in the minds and purposes of many of the Western members representing Agricultural Colleges, and the subject was introduced by President FOLWELL, of Minnesota, who complained of the unequal distribution of the public lands by the act of 1862, on the basis of representation—each State receiving 30,000 acres of land to each Senator and Representative—asserting that some of the younger and growing States were entitled, at the time of distribution, by their population, to larger representation than they then had, and hence to more land; whereas the reverse was the case in some of the older States. He submitted the facts, and recommended an increased grant of land to the various colleges, and an equalization on the basis of acreage or superficial area of the States and Territories. This whole subject, together with resolutions offered upon it, was referred to a committee of five.

Committees Appointed.

On Equalization of Land Grants—Folwell, Gilman, Abbott and Fielder.

On Military Education—Gregory, Clark of Mass., Clark of Vermont, Atwood, and Klippart.

On Experimental Farms or Stations—Nicholson, Mehan, Hamilton, Johnson, Allen.

On the Relations of the Department of Agriculture to Agricultural Colleges—Barnett, Curtis, Smith, Reynolds, Robeson.

Report on Equalization of Land Grants.

Friday morning, President FOLWELL of Minnesota presented the following report:

Whereas, The lands donated by the act of Congress, approved July 2d, 1862, for the endowment, support, and maintenance of at least one *college*, where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts, in such manner as the Legislatures of the States may respectively prescribe; that is to say, devoted generally to the liberal, and then in particular to the practical education of the industrial classes in the several pursuits and professions of life; and

Whereas, The endowments resulting from this grant will be in every case insufficient for the support of a reputable college of comprehensive character; and

Whereas, The apportionment of the lands on the variable basis of representation alone, according to which eleven States and Territories received nothing, and many large States, capable of supporting a population of millions, received less than some small States; and

Whereas, Subsequent legislation required many of the States to accept land scrip of doubtful value instead of the lands themselves, donated in the original act of endowment; therefore

Resolved, That Congress be respectfully asked by this body to remedy both the inequality and insufficiency of the endowments of the act of 1862, by granting additional lands in such quantities that no State shall receive less than one million of acres, which may be selected and located according to the pleasure of the grantees.

Resolved, That the additional endowments so granted should, in all cases, fall to those institutions already established under the provisions of the act of 1862, or which may hereafter be established in pursuance of the same.

Resolved, That a committee of one from each State here represented be constituted to bring the subject of these resolutions to the attention of Congress.

WM. W. FOLWELL of Minn., Chair'n.
T. C. ABBOTT of Mich.
J. B. BOWMAN of Ky.
HERBERT FIELDER of Ga.
D. C. GILMAN of Conn.

This report was discussed in detail, and resulted in eliciting many interesting facts from members, to which we shall have occasion to refer when we have more space. The report was not adopted. Substitutes were offered, and finally the following, offered by Dr. GREGORY of Illinois, was adopted:

Resolved, That this Convention respectfully recommend to the Congress of the United States the bestowal of an additional liberal grant of land, or the proceeds thereof, upon the colleges of agriculture and the mechanic arts which have been established in the several States and Territories, in accordance with the enactment of July 2, 1862, and its amendments, and upon such as may hereafter be established in States and Territories where such institutions have not yet been established.

Resolved, That a committee of one be appointed from each State and Territory here represented, who, with the presiding officer of the Convention, shall urge the foregoing resolution upon the attention of Congress.

Seed Distribution.

Appended to a series of resolutions emanating from the Commissioner of Agriculture, was the following, which was adopted without discussion or dissent. It did not seem to attract the attention of the members; and, indeed, many of them assured us subsequently that they did not know that such a resolution had been presented. This is it:

Resolved, That the Convention be requested to appoint a committee of five, whose duty it shall be to visit the Committee of Agriculture of the two Houses of Congress, and request them to increase the amount of appropriations for the distribution of publications and seeds of this Department.

The Commissioner Exercised.

Friday afternoon, immediately after the assembling of the Convention after recess, the Commissioner of Agriculture got the floor and washed his hands of the Convention and its acts in the following graceful language. We deem it of sufficient importance to make it historical by recording it; for many considered the language insulting to the Convention, and the manner of its delivery highly objectionable. He said:

I would be glad to occupy the attention of the members for a few moments. I have some fear that the Convention will not arrive at what it was hoped we would in the beginning. We desired to have intercourse with the colleges of the States, because they were perpetually in session. We hoped through the colleges to have intercourse with the people of the States. We wanted to give to these colleges all the seeds we had, all the roots and bulbs, &c., and only asked in return that they keep the Department advised as to the experiments tried in the different parts of the country.

You will readily see that when I called this Convention the question of the public lands did not enter into my mind. While I say that I don't object to any application that the Convention may make to Congress, I simply want to rid the Department of any responsibility in the matter whatever. Let the responsibility rest with the Convention alone. We want it distinctly understood that we wash our hands clear of this matter, and we would like the reporters to so say. There shall never be any distribution of the public lands unless one-tenth thereof shall be kept in timber inviolably.

It is a matter that enters into the climatic effect of the country. It is more important for sheltering the crops than the winters, or anything else, that one-tenth of all of these lands should be reserved for timber. Whatever influence you gentlemen may have upon Congress, I look upon this as of far more importance than anything you have yet acted upon.

The subject of disposing of these lands upon the ratio I would like to speak of. Now, by the act of 1862, a most unjust distribution is made of these lands. In Minnesota there were but one hundred acres, while in New York there were over eight hundred thousand. This distribution was unfair, because the State of Minnesota is capable of having a population equal to that of New York. The distribution of public lands should be according to the area of territory. Congress will make this distribution upon some basis, upon some *pro rata*, as they always do; and as that is evident, let us suggest, for the purpose of bringing into requisition the minds of Congress upon this point. I would say, give one-half of these lands to population and one-half to area. I have said now all that I have to say. I want to wash my hands clear of all the folly of which you have been guilty.

Relations of Department of Agriculture to Ag'l Societies and Colleges.

The Committee, through Mr. BARNARD of Georgia, made the following report on this subject, which was adopted, and referred to the Commissioner of Agriculture:

The committe to consider and report upon that portion of the recommendations of the Commissioner of the Department of Agriculture which refers to the establishment of closer relations between that Department and the State societies and agricultural colleges throughout the country, beg leave to report;

That they regard the recommendation as one of prime importance, full of promise of future good, yet attended with difficulties not generally appreciated. Combination is strength, but to combine is not easy. Comparison is the chief means of knowledge. The National Department of Agriculture presents peculiar advantages for securing effective co-operation and for furnishing the means of studying the comparative agriculture of different States and sections, and when so studied, of diffusing information as to results. It is the lens to concentrate the scattered rays of light coming from all parts of the country, and the eyes which look through it wisely can report what they indicate.

To comparative agriculture, as to comparative anatomy or philosophy, we are to look for the best data for observation. It is unnecessary to dwell upon a point so obvious to all reflecting minds.

In carrying out the great ends of its organization—the increase and diffusion of knowledge—the Department has done much in the past. The call of this convention is another step in the right direction.

What can the Department do further on its part—what the State organizations and colleges on theirs?

In addition to furnishing the materials for the study of comparative agriculture—with improvements growing out of closer relations to other societies—it can also aid in improving and perfecting the organizations. It can furnish to all an abstract of the constitutions and modes of each State society, and of all the colleges, for study and comparison; in a word, for comparative organization as well as comparative methods of cultivation. The organization, in some states, is far more efficient than in others. Yet the latter pursue their course, little guided by the experience of the better organized societies. No one need underestimate the advantages of a good constitution—not merely a collection of words, but a practical system.

Much light can thus be thrown upon such questions as the proper relation of these societies to the States—whether the members should be all who unite as individuals, or composed of representatives of societies.

The Department can distribute the labor of observation and co-ordinate them among the other bodies acting in concert with it. Certain departments of investigation can be assigned to certain States, which again can subdivide them among its counties. The field is immense, and subdivision necessary. Proper subjects can be assigned for scientific observation to the different colleges, for which societies would not be fit observers. By such means, instead of separate and independent investigations, without consent, a wider field would be covered, and yet each part of it more thoroughly cultivated.

What the societies and colleges can do towards the National Department is the counterpart of its duties to them. They can report to it; accept its problems of investigation; inform it of their own methods, constitutions, &c., and consider its suggestions.

Much of the time of the convention has been occupied with questions concerning the agricultural colleges. They have a great work to perform. But it must not be forgotten that the intention of the actual body of farmers who have passed beyond their college life must for years be the chief means of practical improvement. We most earnestly bid the colleges God speed in their mission of spreading light and knowledge, but we would not forget the present generation of men who have not enjoyed these opportunities. To diffuse knowledge is a more tedious process than it is usually regarded; indeed, a very stern and difficult work.

Could we but diffuse what is already known, what a stride would at once be gained! But it is by tedious individual effort that education is attained. It is needed by each quarter, and by each member of it.

The committee, not to dwell too long, would recommend—

1. That the several societies and colleges have some specific organ of communication with the Department of Agriculture, the person, time, and topics known, and that the Department prescribe the topics, with appropriate printed inquiries.

2. That an annual convention, like the present, be held, in which representatives from the several State societies and other societies, covering a larger or smaller area, and the agricultural colleges, may be represented on some proper basis.

3. That the Department tabulate the information thus obtained, and distribute it amongst the several lesser organizations. Amongst the subjects to be presented shall be the briefs of all the organizations of States and other large district societies, with such revision and suggestions as may aid in determining the best mode of organization.

4. That the several State societies co-operate fully with the Department in obtaining statistics of every sort—especially of growing crops—and make suggestions as to improved methods of estimating them; also, in such observations upon the weather as may greatly increase the data for determining the local variations of the season. The degree of success already attending the observations made give encouragement to this direction of inquiry—to be made in detail, to endeavor to determine the local laws—and for larger periods, to anticipate the probable state of the seasons, and possibly to influence them to some extent, or at least better to conform to them.

5. The Department shall consider the entire field of investigation, and assign to the several State societies appropriate subjects of observation, and also subjects for scientific investigation by the agricultural colleges and professors.

6. It shall collate information as to the practical working of different forms of minor organizations, less than State societies, so as to exhibit the best and most approved form of clubs for the immediate information and education of the farmer at his work—making them schools for the ear and eye alike.

7. Prior to the assembling of the National Convention, specific subjects of consideration shall be prescribed, and persons of high qualifications appointed to open the discussions.

8. That for each duty a specific organ, whether of the Department or the societies, shall be provided, either by the appointment of an individual or a committee. Thorough elaboration of information, and a proper digestion of matter for publication, shall, if possible, be the duty of some officer of the Department.

9. That among the subjects for reports at the next convention held, according to the first resolution, be the following:

First. On the importance and means of improving physical expertness in agricultural labor, the object being to devote to the development of human skill the attention too much confined to the horse and the brute creation, and a report to be presented concerning experts in farm labor.

Second. On the importance to farmers of accurate accounts of expenses, receipts in detail, and of careful study of these, as a means for constant annual improvement.

Third. On the best means of organizing neighborhood associations for mutual improvement.

Fourth. On the best method of conducting experiments, and the necessity of careful records, and of separating the conditions involved.

10. That copies of this report be communicated to the several State societies and agricultural colleges of the United States, and they be requested to communicate their action in regard to the proposed relations to the National Department of Agriculture, and of the persons appointed as organs of communication.

A Secretary of Agriculture.

An effort was made on the part of CHAS. W. MURTFELDT of Missouri, to distinguish himself, by asking the Convention to adopt a resolution recommending the changing the title of the Commissioner of Agriculture to that of Secretary of Agriculture, and demanding for him a place in the Cabinet. HORACE MAYNARD of Tennessee punctured this bubble of gas, by stating that the Department of Agriculture is entirely distinct from any other Department of the Government, and that the Commissioner's place in the Cabinet is entirely a matter of discretion with the President—just as is that of the Attorney and Postmaster Generals. If an increased salary for the Commissioner is desirable, it should be asked for. The idea of asking that the present Commissioner should be considered a National Counselor, in view of the figure he presented to the Convention, seemed to strike all as ridiculous. Mr. MURTFELDT's proposition was laid on the table.

Planting Forest Trees.

Mr. LINES of Kansas offered the following resolution, which was adopted:

Resolved, That we earnestly advise and entreat the farmers of our whole country, who are favorably located for the purpose, to plant forest trees, not merely for shade and ornament, but by the acre and hundreds of acres, in order to reproduce forests, to take the place of those that are being so rapidly and fearfully demolished in every direction, thereby not only providing for the actual necessities of those who are to come after us, but also to avert calamities that can neither be imagined or described, that must eventually ensue whenever our broad land shall be stripped of its forests, and consequently deprived of the numerous beneficent influences they are known to impart.

This closes the record of the proceedings of the first two days. We shall give the report of the third day's doings next week.

Farm Economy.

SUPERPHOSPHATE OF LIME.

R. P. C., Ionia, Mich., asks about the conversion of bones into superphosphate of lime. We republish, in response, an answer given in the last volume of the RURAL NEW-YORKER to a similar question from a correspondent. Superphosphate of lime is composed (if pure) of bones, bone dust, bone black, or the pure ashes of bones, with sulphuric acid added. In WARING'S Elements the following method of preparing it is given:

"The process of making it from whole bones is slow and troublesome, as it requires a long time for the effect to diffuse itself through the whole mass of a large bone. When it is made in this way, the bones should be *dry*, and the acid should be diluted in many times its bulk of water, and should be applied to the bones (which may be placed in a suitable cask, with a spiggot at the bottom,) in quantities sufficient to cover them, about once in ten days; and at the end of that time, one-half of the liquid should be drawn off by the spiggot. This liquid is a solution of superphosphate of lime, containing sulphate of lime, and may be applied to the soil in a liquid form, or through the medium of a compost heap. The object of using so much water is to prevent an incrustation of sulphate of lime on the surfaces of the bones; this must be removed by stirring the mass, which allows the next application of acid to act directly on the phosphate remaining. The amount of acid required is about 50 or 60 lbs. to each 100 lbs. of bones. The gelatine will remain after the phosphate is all dissolved, and may be composted with muck, or plowed under the soil, where it will form ammonia.

"*Bone dust*, or *crushed bones*, may be much more easily changed to the desired condition, as the surface exposed is much greater, and the acid can act more generally throughout the whole mass. The amount of acid required is the same as in the other case, but it may be used *stronger*, two or three times its bulk of water being sufficient, if the bones are finely ground or crushed; more or less water should be used according to the fineness of the bones. The time occupied will also be much less, and the result of the operation will be in better condition for manure.

"Bones may be made fine enough for this operation, either by grinding, etc., or by boiling under pressure, as previously described; indeed, by whatever method bones are pulverized, they should always be treated with sulphuric acid before being applied to the soil, as this will more than double their value for immediate use.

"Bone-black is chiefly used by manufacturers of superphosphate of lime, who treat it with acid the same as has been directed above, only that they grind the black very finely before applying the acid.

"*Bone ashes*, or bones burned to whiteness, may be similarly treated. Indeed, in all of the form of bones here described, the phosphate of lime remains unaltered, as it is indestructible by heat; the differences of composition are only in the admixture of organic constituents.

"*The reason why superphosphate of lime is so much better than phosphate*, may be easily explained. The *phosphate* is very *slowly* soluble in water, and consequently furnishes food to plants slowly. A piece of bone as large as a pea may lie in the soil for years without being all consumed; consequently, it will be years before its value is returned, and it pays no interest on its cost while lying there. The *superphosphate* dissolves very *rapidly* and furnishes food for plants with equal facility; hence its much greater value as a manure."

ECONOMICAL NOTES.

Manure for Strawberries.—Please tell me what kind, how much, and when to apply manure to strawberry plants. AMOS W. WOODCOCK, *Salisbury, Md.*

WE prefer old, well rotted barn-yard manure. The quantity must be determined from the character of the soil, whether rich or poor, and the amount you can afford. Twenty-five to one hundred two-horse loads may be applied per acre. Apply enough to make the soil rich, and of this you should be the best judge. If you intend planting in the spring, put on the manure the previous autumn, but if this cannot be done conveniently, apply early in the spring and plow it under, covering about four inches deep. Thoroughly harrow the land before planting; in other words, put it into as good a condition as possible for the reception of the plants. Extra fine strawberries are only produced through extra culture. We have expended two to three hundred dollars per acre in preparing land for strawberries, and had the first crop pay all expenses, leaving the soil permanently improved.

Salt Hay for Manure.—Will you or some of the readers of the RURAL NEW-YORKER please inform a beginner what is the value of bent or salt hay per ton for manure, used as bedding for stock? Also the value per ton of sea weed washed on shore by the tide, resembling moss, which is filled with small shells, either alone or composted with barn-yard manure.—A. C. M.

SALT hay is an excellent absorbent to be put in stables, but of itself worth very little for manure. It is one of the lowest in the scale of grasses, and contains little more fertilizing materials than oak or pine sawdust. It is not worth over $5 per ton for this purpose. Sea weed, on the contrary, contains a large amount of fertilizing matter, in addition to shells and other substances which usually accompany it. It is probably worth $10 per ton in localities where manure is scarce. Of course we refer to these materials when dry.

Legislation to Prevent Fires.—A St. Lawrence Co., N. Y., correspondent, who writes us of a great destruction of timber, hundreds of miles of fence and many buildings in that county in October, says:—"Our timber is getting scarce and valuable, and thousands of acres are being destroyed every year by fire, which in most cases are set by careless, heedless and irresponsible persons, having no respect for their neighbors' property and interests so long as they can accomplish their own ends." He urges the necessity of some legislation that shall prevent and punish such vandalism. We agree with him as to the necessity of such, and urge those most likely to suffer to move in the matter while the Legislature is in session.

Treatise On Clearing Woodland.—Wm. H. PELLS asks us "if there is any treatise on clearing woodland, and any machinery to aid in the work. Are there any published directions for making charcoal? What kind of brushook is best for cutting bushes." We do not know of any published book which gives detailed instructions in this branch of wood craft. There are saws invented for cutting down trees, but so far as we are aware they have not come into general use as a substitute for the ax. Our observation has not extended into the modern practices in heavily timbered countries. Let some of the intelligent back-woodsmen among our readers answer our correspondent.

The Poultry-Yard.

N. Y. STATE POULTRY SOCIETY.

PREMIUMS AWARDED AT THE ANNUAL EXHIBITION AT ALBANY, FEB. 9-15, 1872.

Asiatic Class.—Light Brahmas—1st, B. Montague, Mount Vernon, N. Y.; 2d, 3d and 4th, P. Williams, Taunton, Mass. Dark Brahmas—1st, P. Williams; 2d, J. Mandeville, N. Y.; 3d, G. H. Leavitt, Flushing, N. Y.; 4th, Loucks, Salisbury Center, N. Y. Buff Cochins—1st, P. Williams; 2d and 4th, G. H. Leavitt; 3d, G. H. Warner, N. Y. Mills, N. Y. Partridge Cochins—1st, G. H. Leavitt; 2d and 4th, P. Williams; 3d, G. H. Warner. White Cochins—1st and 2d, P. Williams; 3d, G. H. Leavitt; 4th, J. Y. Bicknell, Westmoreland, N. Y. Black Cochins—1st and 2d, P. Williams. Champion cup for Asiatics—P. Williams, for White Cochins.

Dorking Class.—Colored—1st, H. Hales, Ridgewood, N. J.; 2d, G. H. Warner. Silver Grays—1st and 3d, G. H. Warner; 2d, W. Simpson, Jr., West Farms, N. Y.; 4th, H. Hales. White—1st, G. H. Warner; 2d, H. Harrison, Rochester, N. Y.; 3d, J. Y. Bicknell. Dominiques—1st and 4th, O. Howland, Auburn, N. Y.; E. G. Studley, Cleverack, N. Y.; 3d, W. Simpson, Jr.

Game Class.—Black-Breasted Red—1st and 3d, J. Y. Bicknell; 2d, C. A. Cheever, N. Y. city; 4th, J. C. Cooper, Limerick, Ireland. Brown-Breasted Red—1st and 3d, P. W. Hudson, N. Manchester, Conn.; 2d and 4th, M. H. Cryer & Co., Salem, O. Duckwings—1st and 2d, J. Y. Bicknell; 3d, M. H. Cryer & Co.; 4th, J. C. Cooper. Blue—1st, J. Y. Bicknell. White—1st, P. W. Hudson. Pile—1st, P. W. Hudson; 2d, J. C. Cooper; 3d, Jas. Livingston, West Farms, N. Y.; 4th, M. H. Cryer & Co. Any other color—1st, 2d and 3d, P. W. Hudson; 4th, M. H. Cryer & Co.

Spanish Class.—Black—1st and 2d, A. Merwin, N. Y. city; 3d, M. H. Cryer & Co. White Leghorns—2d and 4th, Chas. A. Cheever; 3d, R. L. Haydock, Mott Haven, N. Y. Brown Leghorn—2d, E. W. Haines, Cuba, N. Y.

Polish Class.—Black—1st, W. Simpson, jr. White—1st and 2d, E. G. Studley. Silver—1st and 2d, W. Simpson, jr. Golden—1st, J. Y. Bicknell.

Hamburg Class.—Spangled Golden—1st, O. Howland; 2d and 3d, J. C. Sidell, Englewood, N. J. Spangled Silver—1st, 2d, 3d and 4th, J. C. Sidell. Pencilled Golden—1st and 2d, M. H. Cryer & Co. Pencilled Silver—1st, W. Simpson, jr.; 2d and 3d, M. H. Cryer & Co.

French Class.—Creve Coeurs—2d, James Miller, N. Y. City. Houdan—1st, E. G. Studley; 2d and 3d, G. H. Warner; 4th, J. C. Cooper. La Fleche—1st, J. B. Seymour; 2d, G. H. Warner.

Bantam Class.—Black-breasted Reds—1st and 4th, C. S. Haines, Tom's River, N. J.; 2d, Perry E. Tolles, Troy, N. Y.; 3d, W. Simpson, Jr. Derbys—1st, C. S. Haines. Brown-breasted Reds—1st and 2d, C. S. Haines. Duckwings—1st, C. S. Haines; 2d, G. H. Warner. Silver Duckwing—1st, 2d and 3d, C. S. Haines. Silver Sebrights—1st, C. S. Haines; 2d, P. Williams. Golden Sebrights—1st, S. J. Allison, Middletown, Ct.; 2d, E. G. Studley; 3d, J. Y. Bicknell. Black African—1st, J. Y. Bicknell. Black Game—1st, C. S. Haines. Irish Gray Game—1st, C. S. Haines. Plymouth Rock Fowls—1st, W. Simpson, Jr.; 2d, O. Howland.

Bronze Turkeys.—1st, W. Simpson, Jr.; 2d, A. C. Hunsberger; 3d, George Van Deveer, Port Jackson, N. Y.

Black Turkeys.—1st, J. C. Cooper, Limerick, Ireland.

Goose Class—Toulouse—1st and 3d, W. Simpson, Jr.; 2d, J. C. Cooper. Bremen—1st, W. Simpson, Jr. White China—1st, W. Simpson, Jr.; 2d, J. Y. Bicknell. African—1st, W. Simpson, Jr.

Duck Class—Rouens—1st, J. Y. Bicknell; 2d, J. B. Seymour, Westmoreland, N. Y.; 3d, G. H. Warner. Aylesbury—1st, G. H. Warner; 2d, J. Y. Bicknell. Cayuga—1st, O. Howland; 2d, J. Y. Bicknell. Top-knot—1st, J. Y. Bicknell; 2d, F. Waterman, Albany, N. Y. Muscovy—1st, J. Y. Bicknell. White Call—1st, W. Simpson, Jr. Wood—1st, W. Simpson, Jr.; 2d, J. Y. Bicknell. Wild Black—1st, W. Simpson, Jr.

Pigeon Class—Pouters, pied cock—1st, W. A. Wood, 135 Maiden lane, N. Y. Pied hen—1st, do. Yellow pied, pair—1st, do.; 2d, J. Y. Bicknell. Black pied, blue pied and red pied—1st, W. A. Wood. Whites—1st, F. F. Pole, Mitchell, Ontario, Canada; 2d, W. A. Wood. Carriers, best cock and hen, best black, blue, dun and red pairs, do. Tumblers, best cock and hen, F. F. Pole; baldheads, 1st, J. Y. Bicknell; agates, 1st, W. Simpson, Jr.; kites, 1st, George Purves, N. Y. city; Berlin, 1st, W. A. Wood; black, 1st, Geo. Purves; any other color, 1st, W. Simpson, Jr. Barbs, best cock and hen, black, F. F. Pole; white, Geo. Purves; yellow, J. Y. Bicknell. Fantails, best cock and hen, W. Simpson, Jr.; white, J. Y. Bicknell; yellow, F. F. Pole. Jacobins, 1st, J. Y. Bicknell. Spanish Runts, best pair, W. Simpson, Jr. Turbits, do. do. Yellow Swallows, W. A. Wood. Yellow Trumpeters, F. F. Pole. Black Nuns, W. Simpson, Jr. Arch-Angels, do. Magpies, do.

Rabbit Class.—Leopold Buck of any color—1st, H. Cawood, Thorne, Yorkshire, England; 2d, A. M. Halsted, Rye, N. Y. Leopold Doe of any color—1st, H. Cawood; 2d, A. M. Halsted. Self-colored Doe—1st, H. Cawood; 2d, A. M. Halsted. Broken-colored Doe—1st, A. M. Halsted. Himmlayan—1st, H. Cawood.

Fish.—Best exhibition of Salmon—Livingston Stone, Charlestown, N. H. Brook Trout—1st, Fred. Mather, Honeoye Falls, N. Y.; 2d, L. Stone. Best Exhibition of Mink—Rossegue Bros., Verona, N. Y.

Dressed Poultry.—Best Collection—O. Howland, Auburn, N. Y.

Special Premiums.—Best Collection from Europe—J. C. Cooper, Limerick, Ireland

Moore's Rural New-Yorker Prize.—Best Breed of Distinctively American Fowls—1st, Dominiques, to O. Howland; 2d, E. G. Studley. Best Trio Plymouth Rocks—W. Simpson, Jr. Best Trio any other variety, Brown Leghorns—E. W. Haines, Cuba, N. Y.

Country Gentleman Prize.—Best Collection of Fowls—P. Williams.

Champion Cup for Asiatics.—P. Williams, on Trio White Cochins.

Thomas McGraw's Prize.—Best Trio Light Brahmas—B. Montague. Best Trio Dark Brahmas—P. Williams.

D. W. Herstine's Prize.—Best Dark Brahma Hen (hatch of 1871).—Henry Turner, Rye, N. Y.

G. H. Leavitt's Prize.—Best Trio Buff Cochins—P. Williams.

G. H. Warner's Prize.—Best Trio Partridge Cochins—G. H. Leavitt.

John J. Berry's Prize.—Best White Cochin Hen—J. J. Berry, Hackensack, N. J.

Geo. B. Tuttle's Prizes.—Best Dark Brahma Hen—Henry Turner. Best Buff Cochin Hen—W. Simpson, Jr.

Wm. B. Hill's Prize.—Best Trio Dorkings—G. H. Warner.

M. H. Cryer's Sweepstakes on Games.—M. H. Cryer & Co.

Dean Sage's Prize.—Best Trio Games, to be judged without regard to feather, and with regard for fitness for the pit—P. W. Hudson.

Geo. A. Birch's Prize.—Best Trio Black Spanish—A. Merwin.

John G. Myers' Prize.—Best Trio White Leghorns—C. A. Cheever.

E. J. Isom's Prize.—Best Trio Black Polish—W. Simpson, Jr.

Thos. H. Greer's Prize.—Best Trio Spangled Golden Hamburgs—O. Howland.

T. H. West's Prize.—Best Trio Spangled Silver Hamburgs—J. C. Sidell.

A. B. Van Gaasbeek & Co.'s Prize.—Best Trio Creve-Cœurs—Jas. Miller.

Delavan House Prize.—Best Game Bantams—C. S. Haines; best Sebright, do., P. Williams; best Black do., J. Y. Bicknell.

D. L. Stage's Prize.—Best collection of Bantams—C. S. Haines.

Congress Hall Prize.—Best coop Capons—E. B. Davenport.

Shaw & Rose's Prizes.—Heaviest Turkey Cock—A. C. Hungberger; do. hen, W. Simpson, Jr.

D. Coleman & Bro.'s Prize.—Best Toulouse Geese—W. Simpson, Jr.

Peter Van Wie's Prize.—Best Bremen Geese—W. Simpson, Jr.

J. Y. Bicknell's Prize.—Best collection of Geese—W. Simpson, Jr.

Fonda & Bagley's Prize.—Best Trio Rouen Ducks—J. Y. Bicknell.

D. L. Stage's Prize.—Best Trio Aylesbury Ducks—J. Y. Bicknell.

S. Watson's Prize.—Best Trio Cayuga Ducks—O. Howland.

S. & P. Templeton's Prize.—Best Pouter Cock—W. A. Wood.

W. Simpson, Jr.'s Prize.—Best collection of Pigeons—W. Simpson, Jr.

P. B. McKelvey's Prize.—Best collection Lop-Eared Rabbits—A. M. Halsted.

W. H. Todd's Prize.—Best device for Transporting Eggs for Hatching—W. H. Todd, Vermillion, Ohio.

P. V. Doyen's Prize.—Best Exhibition Trout—Fred Mather.

POULTRY NOTES AND QUERIES.

Sending Eggs by Express.—Can eggs be packed and sent by express so that we can rely upon their hatching?—J. H. B.

THEY can be packed and sent safely (and are every season), if the packing is properly done; and if the eggs are good, a large per cent. of them will hatch, if they are properly treated by the man who gets them.

Brahma Fowls as Layers.—I wish to ask some of your readers if Brahma fowls will lay eggs in summer as well as native ones?—C. R. R.

Field Crops.

FIELD NOTES AND QUERIES.

Chess and Smut.—One man said, in the RURAL NEW-YORKER, that freezing wheat in a certain way, or manner, would change it to chess. I have raised on my lands from 1,000 to 5,000 bushels clean wheat annually, for the last forty years; have had it freeze out entirely on knolls where the snow was blown off; drown and freeze out by the acre where ponds of water formed from thaws in the winter, when the ground was frozen, but never had any extra chess, nor ever raised a bushel of chess to a thousand bushels of wheat. St. PAUL says GOD gave to every seed his own body. I once raised a clean piece of pure smut, as follows:—In 1830 I sowed nearly seventy acres of wheat on new cleared oak lands, being the first crop. Our practice was to wet the seed and dry it off with newly slaked lime, completely whitewashing every kernel; then sow it broadcast. In finishing the field, my seedsman fell short six or eight quarts of seed; he went to the barn, took the same kind of seed as before used, but having no lime, he thought he must do something to it, and so he did; he wet the wheat and covered it over with plaster of Paris (gypsum), which completely dirtied this little quantity of seed, and finished the field with it. To my astonishment, at the coming harvest this little parcel of ground was a complete bed of smut; not one head in ten had a sound kernel of wheat in it. I mowed it and carted it to the hogs. The rest of the field was the best wheat I ever raised, yielding from thirty to forty bushels of clean wheat to the acre and free from chess or smut.

Some writer in the RURAL NEW-YORKER has said that smut was caused by an insect puncturing the kernel. If this be true, the little insects were kind to me—doing all their mischief in one corner of the field, so that it could be cut by itself.—H. C.

Growing Potatoes without Plowing.—"I planted potatoes by dropping them on top of the ground and covering them with straw last year. I had a good yield in quantity, but poor in quality. The exposure of the potato to light and air gives them a green color, so that they not only taste bad, but are thought to be poisonous. I do not want to try again." So writes a correspondent of the RURAL NEW-YORKER at Madison, N. Y. He does not tell us how deeply he covered his potatoes, but evidently not deep enough, or they would not have been colored. We have seen good crops of good quality produced by covering five or six inches deep with straw.

Orchard Grass.—An "Old Subscriber" writes:—"I have had no experience with Orchard grass. How often does it need renewing?" It has a perennial root and needs no renewing. It is a grass that abides well where it is once established, and for that reason is vastly better than timothy for mixing with red clover. Another reason is that it blossoms earlier than timothy and about the time of red clover, and is therefore ready to cut with the clover. It is a grass that has been far too long neglected in this country by the mass of farmers, both as a pasture and mowing grass

Tobacco in Ohio.—A. G. H., Clayton, O., writes, Jan. 13:—"Within three miles of Salem, O., over two hundred acres of tobacco were cultivated last season. The price ranges from eight to fifteen cents per pound, according to quality. Many farmers are holding tobacco for better prices, and buyers are not doing much. We in Ohio cannot see why there is such a difference between Ohio and Connecticut tobacco. Is the difference in quality caused by a difference in climate or culture, or in the care taken of it? Will some one please tell us?"

When to Top Tobacco.—Will some of the readers of the RURAL NEW-YORKER inform me the best time to top tobacco; how many leaves to let grow; the proper time to sucker—whether while the dew is on, or when dry? What is the cause of the leaf rusting? And if we cannot do it up in some shape at home, without pressing, so we can use it for chewing tobacco?—A SUBSCRIBER.

Plows and Plowing.—Although it is an advertisement of a particular plow, a little book with this title, by THOMAS M. NICHOL (161, Nassau St. N. Y. City) contains many very useful hints and sound ideas about plowing.

The Naturalist.

HOW RATTLESNAKES POISON.

In the RURAL NEW-YORKER, Feb. 11, 1871, I read S. HAGEMAN'S account of the rattlesnake's biting, and using the tongue to poke in the poison. The learned doctor is all wrong. He says, "the snake carries a small sack, or pouch containing the poison, immediately under the tongue, and when angry, a small quantity is thrown against the tongue, and as it pierces the flesh the virus is left in the wound, where it is soon drawn into the circulation, contaminating the whole system."

I will describe what I have seen and know. In the year 1829 I purchased a farm in Canada, and with it had to take a few Mississanga rattlesnakes who had possession. Harvesting my first crop of wheat, in 1830, one of the men was about to bind a rattler in his bundle, but saw him at the instant of grasping the grain, and before his hand came in reach of him; being terribly frightened, he halloed, "Rattlesnake!" We all left work to see him. I ran a pitchfork tine through his body, about a foot from his head; he coiled his body round the fork handle. He was about three feet long. He raised his head erect about a foot high, and drew back to an angle of 45°, his upper jaw falling back, then striking forward as quick as thought upon the hard, smooth fork handle: his two poison teeth, or fangs, run out from the inside of the rim of his upper jaw—one each side, and a full half inch in length—and as they struck the fork handle, which was plain to be heard, deposited a small drop of yellowish-green poison, which issued from the hollow tusks about the twentieth part of an inch back from the point.

The tusks formed about a quarter circle, the size of a common darning needle, a little flattened, and scalloped out on the under side—something like a pen made from a goose quill. Where the little drop of poison issued from the hollow tusks I could plainly see the whole performance, as my eyes were within two feet of him. He appeared to be extremely cautious about keeping his tongue and under jaw away from the poisonous tusks; as he raised his head from the fork handle these crooked tusks slowly drew back into the jaw; the little holes were plain to be seen after the tusks disappeared, before he closed his mouth. Neither his tongue nor any part of his mouth came near the poison teeth. I made him bite many times, to learn the whole performance. My impression was that to bite on to flesh he would deposit the poison a half inch deep. H. C.

Paris, Canada.

THE writer of the foregoing sends us the following communication received by him from JAMES DICKSON. It is interesting enough to warrant its publication in connection:

DR. PHILPOT, late of Simcoe, county of Norfolk, Ontario, had two rattlesnakes. Into a box with one of them he introduced a large rat. After a considerable period, during which the snake did not appear to take any notice of the rat, he suddenly reared his head and made a dash at him. The rat died in seven seconds after. Dr. PHILPOT then took away the rat, skinned it, and found that one of the fangs had penetrated through the skin and subcutaneous cellular tissue, and passed completely *through* one of the ribs.

According to the dissections made by naturalists, and the observations of non-scientific observers, the upper jaw of the rattlesnake is furnished with two hollow tusks, attached to a membranous sac, which contains a greenish looking fluid. These tusks being of much greater length than the other teeth, admit of being retracted, so as to lie perfectly flattened when the animal is at rest. When the animal strikes, these tusks are erected, and being driven into the body of its prey, press upon the sac, and the poison passes from thence through the tusk into the wound.

On the banks of the Grand River, at Cayuga, the county town of Haldimand, while residing there thirty years ago, I used to see rattlesnakes in great numbers. On the east side of the river the "mississanga," as the Indians term him, is found; an ugly animal, about two to two and a-half feet in length; body of a dirty, pale brown, with dark brown spots on it. The snake on the opposite side of the river is of greater size, some having been known to attain a length of six feet. This animal has a bright yellow body, with darker spots on it. A little more than a mile below Cayuga Bridge, on the west side of the Grand River, is a small fall, not over four feet in hight, called the Rattlesnake Fall, from the number of snakes which may be seen basking round it in the noontide sun of a hot summer's day. I knew an individual in the neighborhood, a blacksmith, well known to every one, whose name was NAT DENNIS, who wore a rattlesnake's skin for a hat-band. This man used to catch rattlesnakes, cook them and eat them. He declared they were superior in flavor and tenderness to chicken. From him I learned the description of the rattlesnake's hollow tusk and poison bag. He mentioned a rather remarkable fact, that the mississauga is never seen on the west side of the Grand River, nor does the large, yellow snake ever invade the territory of his dirty brown neighbor. The tongue is incapable of being used as a weapon of offense.

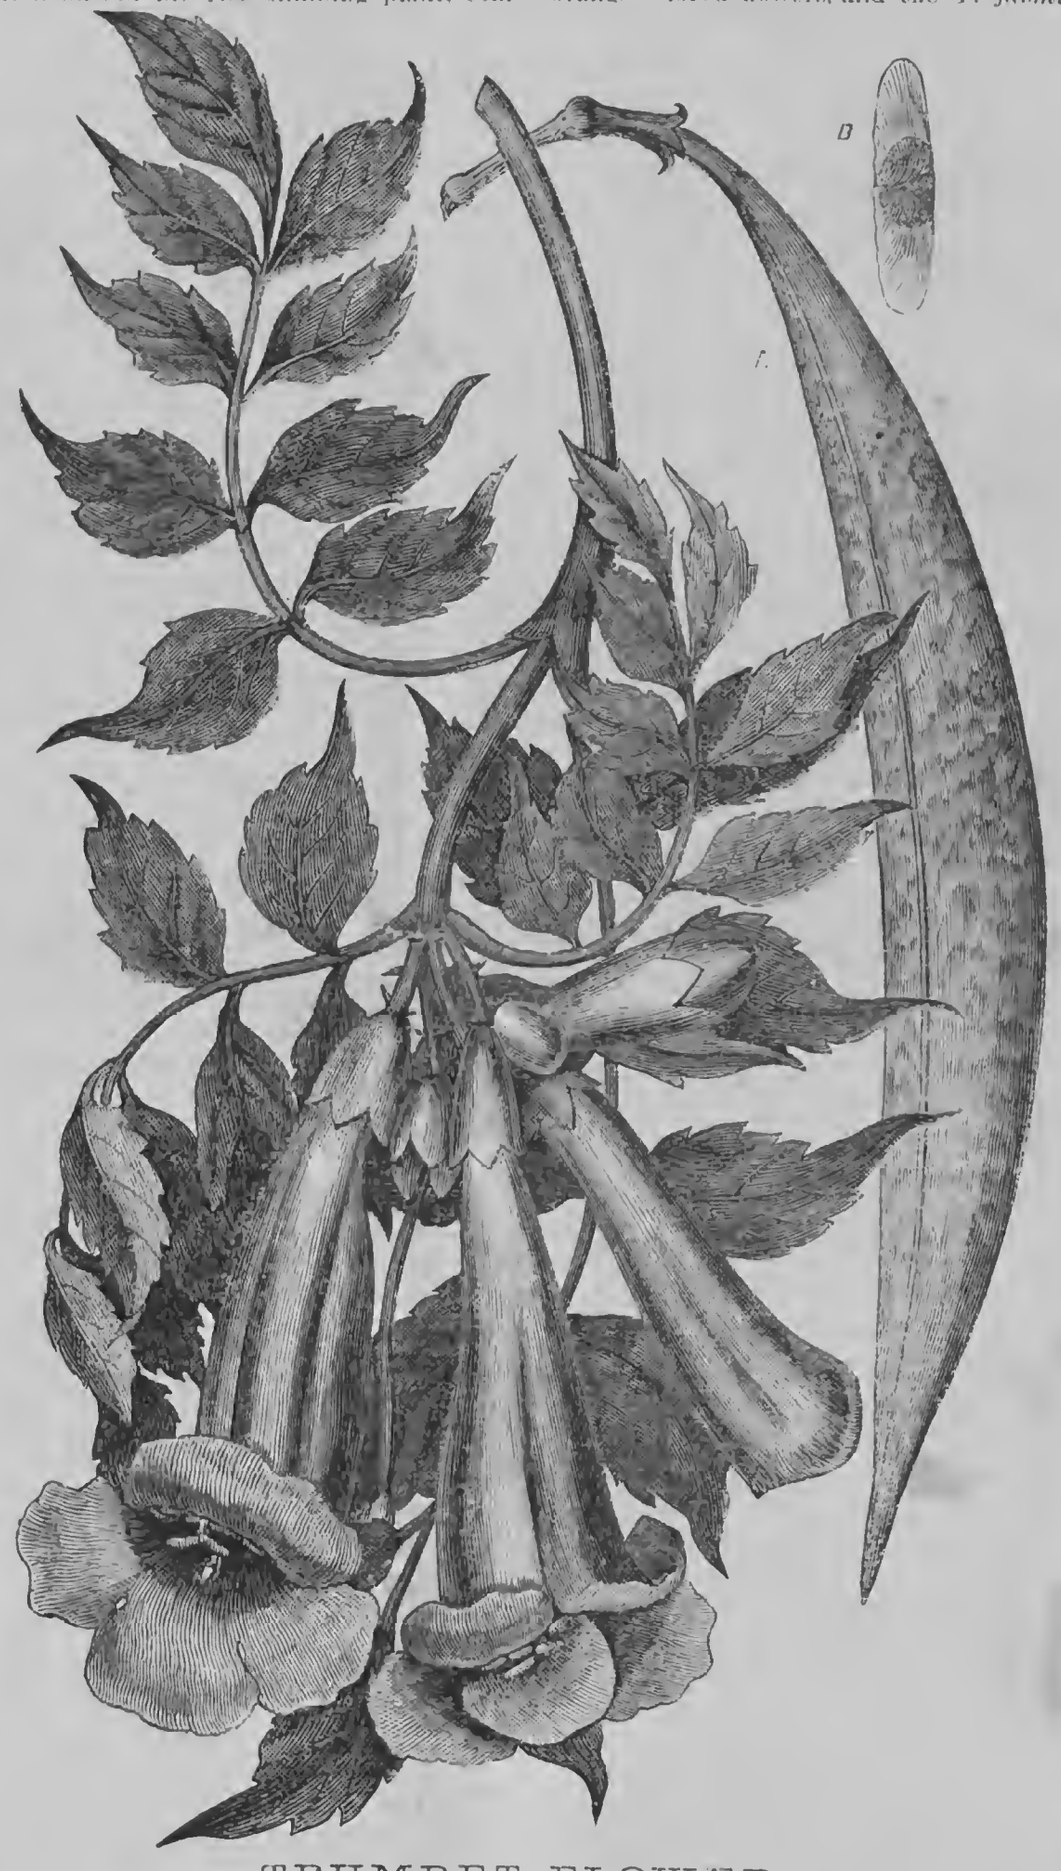
This lengthy statement is not intended to be incorporated with yours; but these things recurred to my memory on the perusal of your paper, and merely tend to corroborate your statement of the manner in which the rattlesnake attacks his enemy.

JAMES DICKSON.

Floricultural.

TRUMPET FLOWER—(Tecoma radicans).

WE presume a majority of our readers will recognize in the accompanying illustration an old favorite climbing plant, commonly known as the Trumpet Flower. It is, however, none the less beautiful because it is old and very common; in fact, it should be valued more highly on account of the the many pleasant associations which usually cluster about every plant that has for any considerable time been an occupant of our garden.



TRUMPET FLOWER.

It is a native of Pennsylvania and southward, as well as some of the Western States, where we have seen it climbing to the very topmost branches of the highest trees, and there displaying its scarlet and orange-colored flowers in the greatest profusion. This particular species (*Tecoma radicans*) climbs freely by means of small rootlets which issue from the stems, clinging to the bark of trees or even rough rocks, old logs, or stumps. The flowers are produced in clusters, from the ends of the small branches, late in summer, and these are succeeded by long pods (*A*) filled with small thin-winged seeds (*B*). For covering the stems of large trees, stumps, or even an arbor, we have few hardy climbing plants that are more easily cultivated or better adapted to the purpose.

There are several other hardy species and varieties in cultivation that are worthy of a place in every garden; but none of them succeed with so little care or climb more rapidly. The *F. grandiflora*, from China, has longer flowers of a similar color, and although hardy in the vicinity of New York City, it is sometimes injured in winter farther North.

There are also several hybrids between these two species, also varieties raised from seed of the first named. *T. sanguinea* is perhaps the best, the flowers being a dark orange red, approaching a crimson.

The tender exotic species are worthy of attention by those who have conservatories or reside in the Southern States. *T. Capensis*, from the Cape of Good Hope produces long naked-pedunceled clusters of orange-colored flowers, and the *T. jasminoides* from Australia has a smooth turning stem, flowers white, with a pink or purple throat. It is an exceedingly lovely plant, and would be a valuable addition to the gardens of our Southern homes.

FLORICULTURAL NOTES.

New Lilies Wanted.—If CARRIE J., who desires to obtain new lilies, will send us her address in full, we may be able to put her in communication with some one who has the lilies she desires. We wish our correspondents would always bear in mind that their address in full is always desirable, not necessarily for publication, but as a guide to us in giving answers, if no more; but it frequently occurs that we wish to communicate directly with them, and not through the columns of the RURAL NEW-YORKER. Assume any *nom de plume* you choose, but do not omit to give your name and address in addition.

Arboricultural.

ARBORICULTURAL NOTES.

Yellows on Peach Trees.—At a Fruit Growers' Convention in Muskegon, Mich., Feb. 1, Mr. NOWLEN is reported to have given the following as a specific remedy for yellows in peaches:—It was to dig down two feet to the roots of the tree affected, throw on a pailful of hot water, besprinkle it plentifully with ashes, and fill the hole in again. It is believed that the cause of the disease is created by a fungus growth at the roots. The Benton Harbor people were confident that the boiling hot water and the ashes were an effectual cure. The symptoms of the disease were a premature ripening of the fruit, the yellowish cast of the leaves, and a peculiar spiral wiry growth of twigs from the branches. This might occur also from the borer.

Sour-Wood and Crystalized Honey.—I saw in a bee journal the statement made by a correspondent, that he had noticed that when Sour-Wood was in blossom, honey would become candied or crystalized. What is Sour-Wood?—D. F. PEMBROKE.

THE Sour-Wood, or Sorrel Tree, was formerly known in botanical works as *Andromeda arboreum*, but is now called *Oxydendrum arboreum*. The leaves are quite acid, hence both the scientific and common names. It is quite common in rich soils, from Pennsylvania south and westward to the Rocky Mountains. Whether the honey gathered from the flowers will become candied sooner than that from other plants, is a question for apiarians to answer.

Locust Trees Fruiting.—Will you please tell me how to determine whether a young locust tree will bear fruit or not? The fruit of the locust tree is very good for making beer, in N. C., but only some trees will bear. I would like to know the characteristics of the fruit-bearing, (or non-bearing) trees, in order to determine whether to let them occupy space or not.—M. F. BASON, *Haw River, N. C.*

We do not know of any natural cause for one locust tree bearing fruit and another remaining barren. Perhaps what you call locust is known by some other name elsewhere. Please send seed and a leaf to aid us in determining the true name of the tree to which you refer.

Planting Nuts.—I would like to learn how to proceed to grow Chestnut, Hickory, and Walnut trees from the seeds. I presume there are others who feel an interest in this direction.—SUBSCRIBER.

With all large hard-shell nuts, like the hickory and walnut, the best way is to plant in fall before the ground freezes. Chestnuts are more delicate and must be handled with more care. We usually mix with sand soon after gathering them and bury in some dry place until spring; sow in drills, covering the nuts about an inch deep. As a rule, forest trees may be grown as readily as corn or potatoes.

Hawthorn Wanted.—In the RURAL NEW-YORKER of June 17, 1871, is a description of the hawthorn. I think they must be beautiful, and would like to procure some for my yard. I would like to know if they will thrive so far North, and where they can be obtained and at what price.—AN OLD SUBSCRIBER, *Binghamton, N. Y.*

The double and single varieties of the Hawthorn will succeed in a much colder climate than that of Broome Co., N. Y. The young trees can be procured at any of our large nurseries. Look for the address of nurserymen in our advertising columns, and send for their catalogues.

"French Willow."—Look out for humbugs and swindlers! We continue to receive inquires about the "French Willow," asking if there is one. Yes, there are several, but none of them better than our common Golden and Grey Willow. Do not buy willow of peddlers, no matter what their representations. They are, as a rule, swindlers, if they tell you stories of the wonderful growth and variety of any species and of its wonderful qualities for hedging and wind-breaks. Please remember our advice after you have been "sold," if you do not heed it before.

Goats Killing Trees.—Several correspondents have asked for information in regard to preventing goats from gnawing the bark from trees. We certainly do not know of a better plan than killing the goats or tying them up to some post from which the bark had already been removed. If we lived in a community where goats were allowed to run at large, we should either sell out and leave, or have a law passed to prevent such nuisances.

Domestic Economy.

CATSKILL PUDDINGS.

Rice Pudding.—Take one teacup of rice, one teaspoonful salt, add water and boil until tender; remove from the fire; add one quart sweet milk, two or more eggs, small half cup butter, a small teacup sugar, half a nutmeg, and bake. To be eaten warm or cold.

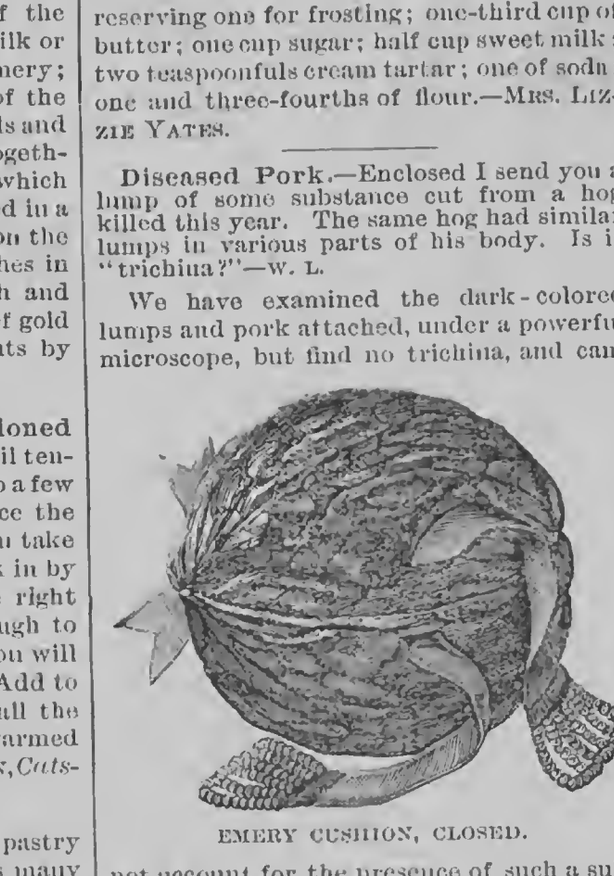
Tapioca Pudding.—Put eight large spoonfuls of tapioca to three pints of milk; warm it; let it soak till it becomes soft, then mix with it two spoonfuls of butter, three beaten eggs, half a cup sugar, half a nutmeg; bake immediately; to be eaten hot or cold—a very excellent and healthy desert.

Rolly Poly Pudding.—Make your pastry as for soda biscuit; roll it about an inch in thickness, add your fruit (raspberries are best), then roll it snug. Put it in your steamer, have your pot of potatoes on the stove boiling, put your steamer over it, and when your potatoes are done, your Rolly Poly will be done also; eat with sweet cream.

ODDS AND ENDS.

Vegetable Oyster Cakes.—Clean the vegetable oysters well, and then grate them; add milk and flour sufficient to make a stiff batter. Proportions, a gill of grated oyster plant, two eggs, one pint of milk, flour to make the batter, and salt. Drop by spoonfuls in hot lard. Fry till brown. Some cooks boil the vegetable until soft enough to mash, which is less work than to grate it. In either case the cake, or fritter, is equal to that made of the real oyster. Try it.

Scissors Case and Needle Cushion Combined.—This is a neat little case, intended to hang upon the wall near the sewing machine or work-table. Our pattern is made up of brown silk and finished with three rows of cords. Three cords are also stitched on as finish for the pockets, which are sewn on the case itself. Cut from the illustrations a pattern in paste-board, and a similar one in silk, allowing a margin to turn in. To make it more substantial, line the silk with thin muslin. The back can be covered with cambric to match the color of the silk. The needle cushion measures three inches across—lined with muslin, and drawn in at the edge with a small cord to give it the proper curve; fill with emery, fine sand, or wool, if preferred.



SCISSORS CASE WITH NEEDLE CUSHION.

Walnut Shell Emery Cushion.—(See illustrations.)—Hollow out both halves of an English walnut shell, and varnish neatly on the outside with copal varnish—first making a slit two-fifths of an inch in the middle of the side of each half. Glue into one of the shells a small cushion, covered with silk or velvet of any color, and filled with emery; the other half is lined with material of the same color, ornamented with gold beads and braid. Join both halves of the shell together, by means of a narrow silk ribbon, which is drawn through the openings and tied in a bow outside. Through the openings on the opposite side, draw a ribbon six inches in length, edged with button-hole stitch and ornamented with a narrow fringe of gold beads. The walnut opens and shuts by means of this ribbon.

How to Make a Good, Old-Fashioned Soup.—Procure a soup bone, boil until tender, remove the meat, add to the soup a few onions, season to suit the taste; slice the onions very thin; set it to boil. Then take some flour in a bowl, drop sweet milk in by the drop, and keep stirring with the right hand, until you think you have enough to thicken the soup sufficiently, and you will have what we call flour rubbings. Add to the soup; let it boil up, stirring it all the time, and it is done. It is excellent warmed over for next day.—MRS. H. S. BROWN, *Catskill, N. Y.*

Apple Dumplings.—Make your pastry as for soda biscuit; roll; cut in as many pieces as you want dumplings; have your apples cored and quartered; wrap the apples in the pastry, and steam the same as Rolly Poly. To be eaten with sweetened cream. They are pronounced *double extra* by our city friends in the summer.

To Keep Fish Fresh.—A method adopted in Portugal for preserving fish consists in removing the viscera and sprinkling sugar over the interior, keeping the fish in a horizontal position, so that the sugar may penetrate as much as possible. It is said that fish prepared in this way can be kept completely fresh for a long time, the savor being as perfect as if recently caught. Salmon thus treated before salting and smoking, possess a much more agreeable taste, a tablespoonful of sugar being sufficient for a five pound fish.

Silver Cake.—Take the whites of six eggs, two cups of sugar, two-thirds of a cup

EMERY CUSHION, OPEN.

of butter, two cups of flour, two teaspoonfuls of cream tartar, one cup of sweet milk, one teaspoonful soda dissolved in milk. The above formula, using the yolks of the eggs, will make excellent gold cake.—X. Y. Z.

Cream Cake.—I herewith send you a most excellent recipe:—Whites of four eggs, reserving one for frosting; one-third cup of butter; one cup sugar; half cup sweet milk; two teaspoonfuls cream tartar; one of soda; one and three-fourths of flour.—MRS. LIZZIE YATES.

Diseased Pork.—Enclosed I send you a lump of some substance cut from a hog killed this year. The same hog had similar lumps in various parts of his body. Is it "trichina?"—W. L.

We have examined the dark-colored lumps and pork attached, under a powerful microscope, but find no trichina, and cannot account for the presence of such a substance in the flesh of a hog or other animal. The pork may not be unhealthy, but as the countrymen say, we would not "hanker after that kind."

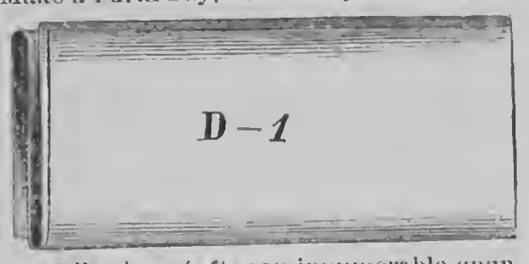
EMERY CUSHION, CLOSED.

Folding Napkins Capuchin Style.—We give, this week, another style of folding napkins—Capuchin fashion. D 1 shows the first fold; D 2, the second; D 3, the third; D 4, the fourth, and D the final appearance when folded.

The Gardener.

THE TROPHY TOMATO.

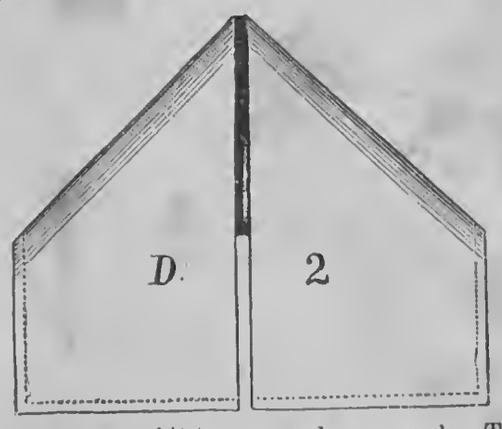
I FIND in the January No. of "How to Make a Farm Pay," edited by G. A. DEITZ,



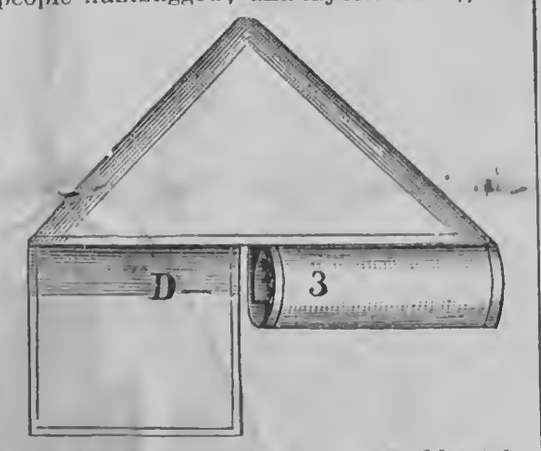
the following—(after an immmerable quantity of testimonials in favor of the Trophy Tomato):

The seeds of the Trophy Tomato were sold last season at 25 cents *each* (20 seeds for $5). Notwithstanding this high price, they were very widely distributed over the whole country, and the reports received from those who grew them make it evident that henceforth the *Trophy will be the only Tomato grown in America.*

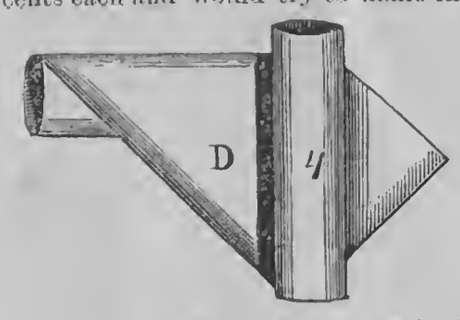
Our readers will see by the above statements that the Trophy Tomato is the best ever offered to the public. We have found it the best we ever raised, and can cheerfully recommend it to our readers as such. To all who *subscribe for this journal* we will send a large packet of Trophy Tomato seed as a premium.



Now I wish to inquire if the above was the price of genuine Trophy Tomato seed; if so there were an immense quantity of people humbugged; and myself among the

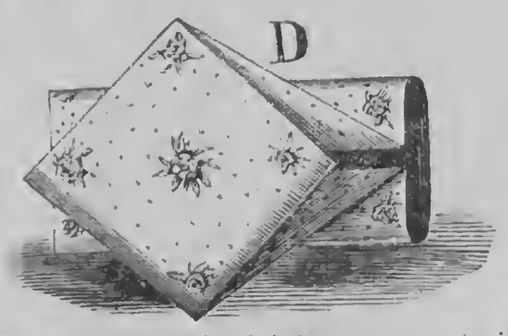


number. I bought seed from an old established seed store at 25 cents per paper, 20 seeds in a paper; and the seed store in Cincinnati and elsewhere advertised to send a package per mail (free of charge) for 25 cents. If I had none of the genuine seed, those at 25c. *per seed*, I must confess I raised no Trophy Tomato. The above looks to me as though Mr. D. wanted subscribers at 50 cents each and would try to make them



satisfied by offering a paper of seed. But aside from the above, I would like to know where I *can* get some genuine seed. C. S. S. TODD.

The Trophy Tomato was first offered to the public in the spring of 1870 at the price named above, viz:—20 seeds for $5,00; but in 1871 the price went down to 25c. per packet. If Mr. D. wrote the article credited to him by you in 1871, he was correct; if in 1872, wrong. He may have written it in Dec., '71, for his paper issued in Jan., '72, which would make some difference. Seeds of the genuine Trophy can be had of any of our seedsmen.



Trees, Seeds, Plants, Etc.

HOVEY & CO.'S
ILLUSTRATED
CATALOGUE OF SEEDS,
AND GUIDE TO THE
Flower and Vegetable Garden,
FOR 1872.

Contains 150 pages, with many fine Illustrations of Flowers and Vegetables, and a beautiful Colored Plate; also a descriptive list of over two thousand species and varieties of Flower and Vegetable Seeds, Novelties of the Season, Choice Gladiolus, Summer-flowering Bulbs, etc.; the most extensive and complete SEED CATALOGUE published, giving plain directions for the culture of Flowers and Vegetables, arrangement of Gardens, etc. Sent free to all.

HOVEY & CO.,
53 North Market Street, Boston, Mass.
Our Seeds warranted Fresh, and to reach Purchasers.

PLANTS, SEEDS, BULBS.

THE BEST CATALOGUE yet Published, containing a complete list of **Vegetable and Flower Seeds**; Bulbs of every sort for spring planting; also Roses, Geraniums, and other Bedding Plants, Small Fruits, &c., &c. Fully illustrated.

☞ **Sent Free to all Applicants.**
Address C. L. ALLEN & CO.,
76 Fulton St., Brooklyn, N. Y.

"FRESH, TRUE, RELIABLE" Garden, Field and Flower Seeds, "SMALL FRUITS," Fruit, Ornamental, and Shade Trees, Shrubs, Roses, Flowering and Bedding Plants (excellent stock), Tuberoses, Gladiolus, etc., etc. Use *true* first quality seeds and plants for first quality vegetables, fruits, etc. Our seeds and plants are of such a character that all may sow and plant with confidence that they will produce true, first-class crops. We grow thousands of small fruits and vegetables for market, and know the value of true and reliable seeds and plants to the farmer, gardener, and fruit grower, etc. We grow the best, and our customers shall have the same. Our catalogue giving cultural directions, and description of Vegetables, Flowers, and small fruits, etc.—and *Order Sheet* and *Direction Envelope*, sent to all on application. Seeds and plants by mail, pre-paid, to any part of the United States. Orders, *large* or *small*, shall have our best attention. *We make a specialty of Gardeners' wants.* Send for Catalogue, and take advantage of our reasonable rates. D. H. BROWN & SONS, Seedsmen and Small Fruit Growers, 21 Hiram St., and Cherry Lawn Farm, New Brunswick, N. J.

MIDDLETOWN NURSERY AND FRUIT FARM.—Situated at Middletown, Del., the largest peach shipping station in the world. 15,000 baskets (⅞ bush.) shipped in summer of 1871, in less than eight weeks—25,000 baskets of them grown on this farm. Peach and other Fruit Trees and Small Fruit Plants for sale. *Peach Trees a specialty!* Buy where long experience in growing the fruit has proved which varieties pay best to plant. Trees and Plants securely packed to go to any part of U. S. Catalogues free. Address E. R. COCHRAN, Middletown, Delaware.

$10,000. Ten Thousand Dollars' worth of Nursery and Green-House Stock, for fall of '72, not yet engaged, which we want to contract to No. 1 experienced canvassers. Southern raised trees for Southern soil and climate. Territory close by the Nurseries. First-rate references given and required. TRUETT'S SONS & MORGAN, Rosebank Nurseries, Nashville, Tenn.

JOHN S. COLLINS, MOORESTOWN, N. Jersey, raises Berries and Small Fruits for market. Sells strong, genuine, best sorts plants at *bottom* prices. Send for list.

I have the Evergreen Broom Corn, the BEST variety in cultivation. Will send one quart of seed to any address for 50 cts. J. ROSS McLEAN, Leeches Corners, Mercer Co., Pa.

Campbell's 60 Days Sugar Corn.—A new hybrid variety, believed to be the earliest sweet corn grown. Long ears, large grains, small cobs, exquisite flavor. Pkt., 25c. GEO. W. CAMPBELL, Delaware, O.

OPIUM EATERS,—If you wish to be cured of the habit, address T. E. CLARKE, M. D., Mount Vernon, Ohio.

Dairy Husbandry.

HOW TO PRODUCE MILK.

At a meeting of the Massachusetts and New Hampshire Milk Producers' Association recently, different milk producers gave their practice in answer to the question: "What is the best method of raising milk?" We quote:

Reed of Lexington feeds his cows 3 times a day, dry feed, including hay, 4 quarts of shorts, 2 quarts of oil meal, and 1 peck of oats for each cow daily. He milks at 5 a. m. and 5 p. m. giving the cows water after every feeding.

Hills of Groton got all the water he could into his cows, as he had learned the more water the more milk. One cow will now drink a tub of water at once with a little meal put into the same. Men cannot make money in raising milk at present prices if the cows are fed on good hay.

Wood of Groton makes more milk than he can sell, and is diminishing the quantity of meal, giving his cows about one-half, and if the prices of milk are not better than at present he shall not give his cows any meal. It cost him 60c a can to raise milk, while he is selling it for less than 40c a can.

Bartlett of Milford, N. H., said it is not all in feeding cows to have them give a large flow of milk, but much depends upon the care and treatment of them,—regularity of feeding and milking. They should be milked regularly, quickly and quietly. There should be a very free use of salt in feeding, since the more salt the more water, and the more water the more milk. He had taught his cows to eat as much salt as possible, and that was a very large quantity.

Stone of Westborough feeds his cows only twice a day, steaming all the food given to his herd; has the milking done regularly and by the same person.

Hutchinson of Milford, N.H., steams all the feed given to his cows, most thoroughly salting the same, so that one cow will drink from 1 to 3 pails of water, 3 times per day, or after eating each of their 3 meals. One cow sometimes gives 20 quarts of milk a day.

Gaut of Groton finds his cows to increase in flesh and flow of milk by feeding them on cotton seed and Indian meal.

PRODUCT OF THE DAIRY AS AN ARTICLE OF EXPORT.

Some idea of the importance of dairy produce as an article of export may be gathered from official statistics, published in the London Milk Journal, showing the quantity of butter and cheese imported into Great Britain for eleven months of the past year, ending Nov. 30th, as compared with the same time of two preceding years. We reduce the figures to pounds and U. S. currency, gold, to make the matter more plain to our readers.

For 11 months, 1871:—Cheese, 129,329,600 pounds, valued at $15,702,010. Butter, 138,216,416 pounds, valued at $32,098,210, making the total value of the imports of both articles, in gold, $47,800,220.

In 1870, for the same time, the imports were:—Cheese, 98,922,656 pounds, valued at $13,767,165. Butter, 113,522,992 pounds, valued at $27,485,265. Total value for 11 months of 1870, $41,252,430.

In 1869 the imports were:—Cheese, 95,090,112 pounds, valued at $13,397,115; and of butter, 126,987,440 pounds, valued at $29,670,330, making total value of the two products, $43,067,445. These enormous quantities of dairy produce, in addition to the large amounts made in Great Britain, show that there is no small consumption of dairy goods in England, and that the annual values of these products imported, is something of an item from the pockets of our British cousins. Of these imports, the United States, Holland and France have furnished the bulk.

The cheese exports from the United States, from January 1st to December 23d, 1871, were 67,530,000 pounds; and of butter, 8,519,700 pounds. For the same time in 1870, cheese, 61,451,500 pounds; butter, 1,394,200 pounds. These exports of the United States, however, did not all go to Great Britain.

DAIRY NOTES.

Good Winter Butter.—To all whom it may concern; and as there are no people who use, (not to say waste) so much, it is fair to suppose that must include a goodly number. To butter makers, this you shall do: Set your milk in a clean, dry room, beyond the reach of an ordinary frost, and when your morning's milk has stood forty-eight hours, and your evening's milk thirty-six, skim, putting your cream into a clean, bright kettle, on a good fire, carefully stirring it to prevent its burning to the bottom; when it boils put it in the crock. Do this every morning, and when you wish to churn, take as much or as little of your boiling hot cream as will bring the whole to about the required temperature. Cream, so heated, may be churned somewhat hotter than is usually considered quite the thing, without detriment to the color or quality of the butter; but, if not in a hurry, let me advise you to take it cool, and churn half an hour or such a matter.—G.

The Apiarian.

BEE HIVES.

In the article on bee hives, in Rural New-Yorker of Feb. 10, H. A. B. says: "We have neither tested the merits of the hives our correspondents have named, or have seen them in use by other bee keepers, and we had rather have the one we described in the Rural New-Yorker of Dec. 16, 1871, than all of them combined."

Now, if he has not tested the hives to which he alludes, and never saw them in use, is he prepared to give an opinion in regard to them? Or, in other words, what does he know in regard to their merits or demerits? A man ignorant of the invention of the mowing machine would, as he swung his scythe, consider it the best implement for cutting grass. But it would be up-hill business for him to convince the owner of one of those labor-saving implements, of the correctness of his opinion. Some months ago your correspondent gave notice, in the columns of the Rural, that he would give a description of a hive which he thought the best, and as he had said a good deal about "patent hives," I (with a good many others) expected something *original* in the coming hive, but found an exact description of a Langstroth "double-story" hive we bought of the agent, (and paid for the right to use) some twelve or fifteen years ago. I then found he meant the *latter* (patent hive,) though he *forgot* to say so.

Again, he says he prefers a two-story hive where the honey extractor is employed to obtain surplus honey; but if the one-story hive is preferred, make the hive large enough to contain two or three extra frames on each side. I prefer the one-story hive, as it saves time for the bees, and "time is honey" for the bee-keeper. I also prefer a hive without any *fixed* chamber, so that any number of sections or frames, from one up to fourteen, can be used, and form a complete hive. By such an arrangement the size of chamber can be regulated to size of swarm when hived, and increased to standard size (seven or eight sections or frames,) as combs are built. By so doing comb building will progess more rapidly, as there is not the loss of heat (requisite for the secretion of wax), there would be when the hive is two or three times as large as the swarm when hived. It will also give room for the combs on each side where the honey extractor is used. J. E. Moore.

Rochester, Pa., Feb., 1872.

HOARHOUND FOR BEE FORAGE.

I notice in Rural New-Yorker of Jan. 13th, a short article headed "Hoarhound for Bees." As you wanted to hear from those who had experience with it, I will give you mine. I was not in the Convention that recommended it. I have one hundred stocks and have both hoarhound and catnip, which are very much alike, and each one very valuable on the prairies. They bloom at a time when nothing else is in bloom, enabling the bees to keep up a steady increase of brood, so that by the time our honey harvest commences in earnest, our stocks are strong and ready to make use of it. Here they commence storing the surplus from the middle to the last of August, and close with the cool weather of October.

I was transferring bees in Missouri three years ago, about the first of July, while the Basswood was in full bloom, and they were storing honey rapidly (but not fifty-three pounds per day, as one asserts); on tasting it I found it had a strong, disagreeable flavor, which was caused by the hoarhound which grew in abundance around the apiary. If I had White Clover or Basswood timber within reach, I would not plant hoarhound, for it blooms so near the others that it detracts much from the flavor of the clover or basswood honey. C. F. Mars.

Leavenworth Co., Kan.

Diary of a Ruralist.

DAILY RURAL LIFE.

FROM THE DIARY OF A GENTLEMAN NEAR NEW YORK CITY.

Fire Wood for Summer Use.—*Feb.* 12.—Although residing in a locality where coal is far cheaper than wood for fuel, the women folks prefer the former in summer for the kitchen. A fire suitable for cooking can be produced in less time with wood than coal, and when the meal is prepared the stove and room soon become comparatively cool, if the fire is allowed to subside. In addition to this, every time a coal fire goes out the stove must be cleared of cinders, which is far more troublesome than merely raking out wood ashes. But I always pity a woman whose husband fails to supply her with dry wood for summer use. Any man who neglects to do this should not grumble if his coffee is cold and his potatoes only half boiled; and a woman who is so unfortunate (and there are thousands of them) as to be subjected to such annoyances, has good grounds for divorce. I have lived long enough upon a farm and among farmers to know that the women have to submit to any number of such apparently insignificant hardships, which, if put upon the other sex, would cause a revolution. The sound of ax and saw upon my own wood pile, for the past week, and the offer of some good hickory cordwood, has led me into this train of thought, which I hope will influence others to attend to this matter before spring work commences.

Guatemala Beetles.—*Feb.* 13.—I received to day a collection of beetles from Guatemala, which almost makes me believe in Darwin's theory of evolution of species. For instance, among them are several *Passalus*, some of which are four times as large as our *P. cornutus*, figured and described in Rural New-Yorker, Jan. 27, page 66, while others are not more than three-fourths of an inch long. We also notice considerable difference in the size of the same species of insect found in Northern and Southern localities, which shows climate has considerable effect on the lower orders of the animal kingdom. It is not strange that it should; because in a climate where summer heat is almost perpetual, there must certainly be a tendency to a more perfect development than in a locality where the greater portion of nature's productions are at rest for at least one-half the year. The larvæ of insects would, of course, work more continuously under such favorable circumstances, and the pupæ remain in a quiescent state much less time, all of which could not fail to increase the size, which, as a rule, is apparent in tropical insects. If we examine any family or genus of beetles, the members of which are found in both hot and cold latitudes, the former, as a rule, greatly exceed the latter in size. The largest beetle belonging to the Buprestian family that we have in the Northern States is our common *Chalcophora Virginica*, which is seldom more than an inch in length, but in the tropics there are nearly related species more than twice as long and proportionately broad. Probably climate has a more powerful influence upon the lower orders of the animal kingdom than upon those which pass through various stages of activity and rest, as exhibited in the metamorphosis of an insect.

At Albany, N. Y.—*Feb.* 14.—Having received an invitation to attend the annual meeting of the New York State Agricultural Society, to be held at the Society's Rooms in Albany, I find myself ensconced in the Delavan House this evening. There are a few of the leading farmers of the State here, who have come to attend the meeting; among them I have met F. D. Curtis of Saratoga Co., Hon. Geo. Geddes of Onondaga, Prof. John Stanton Gould of Cornell University, Joseph Harris of Rochester, and a few other well-known agriculturists. I learn, however, that these meetings of the State Society do not attract the attention of farmers in general, and comparatively few ever come out and take an active part in the proceedings. The farmers of New York are no exception to the general rule, for it is either indifference to progress, or fear of a few dollars expense, which makes most of our State Agricultural Societies a mere farce and of little benefit to men they are designed to aid. If farmers of this age remain poor and ignorant they have no one to blame but themselves, because the wisest legislation is enacted in their favor, and the most noble and learned men in the world are doing all that is possible to promote their welfare and exalt their calling.

At a Meeting of the Agricultural Society, Feb. 15, I attended the morning session, at their elegant rooms on State street. About seventy-five gentlemen, from the quarter of a million of farmers who live in the State, were present. These farmers should have been there or well represented. Mr. Bergh, President of the Society for the Prevention of Cruelty to Animals, addressed the meeting in relation to a bill which he is endeavoring to get passed by the Legislature now in session. Mr. A. S. Fuller of the Rural New-Yorker followed with a paper on "Forestry," which provoked a lively discussion of the subject. During the session this question would frequently crowd itself upon me:—"Where are the thousands of young men of this State who expect to become farmers?" And, "have they no interest in this Society?" Here in this building are magnificent collections of shells, minerals, fossils, seeds, plants, insects, agricultural implements, and, in fact, hundreds of thousands of the very things which should interest every man and woman, but more especially those who expect a close acquaintance with mother earth and her direct products. The poorer class of farmers' sons who happen to reside a considerable distance from Albany, might plead poverty as a reasonable excuse for not attending the Annual Meetings of the Society, or even visiting the Museum; but what shall be said of the richer class, or those living within easy walking distance? Most of the men who do attend the meetings, and take an active part in its proceedings, have arrived at an age and standing in society where they neither need nor desire any honor or emolument that could possibly result from their labors in this direction. Then is it not just to say that they are working for the benefit of those very young men who will not even put themselves in a position where knowledge and honors can be forced upon them. This may appear to be severe and harsh criticism of the conduct of farmers and farmers' sons; but having been "through the mill" myself, I know whereof I speak. I do not pretend to say that farmers' sons are any more inclined to be indolent or remain in ignorance than the sons of men in other walks of life; but it is a fact, nevertheless, that not more than one in ten ever take advantage of the opportunities presented for obtaining a thorough knowledge of agriculture in all its various branches. The sparsely attended meetings of agricultural and horticultural societies throughout the country, as well as farmers' clubs, prove the truth of my words. But it is useless for me to scold, because those boys who have no desire for knowledge, do not read the Rural New-Yorker.

Pomological.

POMOLOGICAL GOSSIP.

Skinner's Seedling Apple, Mr. Hooper says, is a native of San Jose, Cal., and is said to be the very best and most desirable early cooking and early eating apple in the country. The seed was planted in 1854, and the fruit began to attract attention in 1857. Since then it has become a favorite with many cultivators. It is thus described: "The size and shape of the fruit resembles the Spitzenburg, but the color of the fruit is much the same as the Bellflower, but not so yellow. The flavor, also, resembles the Yellow Bellflower, while the flesh is finer, and the pulp quite as juicy as the Rhode Island Greening. We regard the crispness and richness of the fruit as even superior to the Gravenstein, which has always been our leading favorite among early apples. One of the most important qualities of Skinner's Seedling is its persistence in hanging upon the tree. It will rot and dry up before it will drop."

Royal Anne Cherry.—In the Rural New-Yorker of this week you ask if this cherry is known by any any other name, I can say we saw it in great perfection at the large fruit farm of E. D. Lewelling, San Lorenzo, Cal. It is the same as our Napoleon Bigarreau. They had sent fruit of it to market the day of our visit there—June 28, 1870—that measured three and three-quarters of an inch in circumference, and thirty-six weighed a pound. Black Tartarian and other varieties were equally fine. We found the names of fruits at all the orchards we visited correctly stated, and this cherry is the only instance I recollect of where it was not.—Chas. Downing.

To prevent Quinces from falling off.—Remove the earth from the roots of the trees in early spring, and put a quart of salt around them. I have been told this will have the desired effect.—R. G.

The Literary World.

NEW PUBLICATIONS.

The Abominations of Modern Society.—By Rev. T. DEWITT TALMAGE. New York: Adams, Victor & Co.

THIS is a sensational book, by a sensational preacher—a diluted Father TAYLOR. While the book contains a few good points, pleasant to read, most of it is too highly spiced, too jerky and Frenchy. A few pages of such writing tire the reader, and he looks for something which contains more wheat and less chaff. Mr. TALMAGE "lifts up his voice," after a fashion, against Clothes, Midnight, Dancing, Club-Houses, Intemperance, etc. His manner may attract a few thoughtless people, but it is neither genial, dignified nor pleasant. His use of exclamation and interrogation points is profuse. The following extract is one of the best passages in the book, and yet it is simply an assertion, devoid of sense and reason. "Plants love company; you will find them talking to each other in the dew. A galaxy of stars is only a mutual life-insurance company."

Leaves from the Book of Nature. By M. SCHELE DE VERE. New York: G. P. Putnam & Son.

A WORK of more than usual value and interest, crowded with curious information, and smoothly written. Country people will find much delight in its pages, since it is full of the study of nature, and treats of a thousand familiar subjects, such as stones, weeds, fruits, the flight of birds, plants, etc. The different chapters of the book are as follows:—"Only a Pebble;" "Nature in Motion;" "The Ocean and Its Life;" "A Chat About Plants;" "Younger Years of a Plant;" "Later Years of a Plant;" "Plant-Mummies;" "Unknown Tongues," and "A Trip to the Moon." A better work for the young than half the story books published.

Mistress and Maid.—A Household Story. By the author of "John Halifax, Gentleman." New York: Harper & Brothers.

THE author of this quiet and pleasing romance introduces us to a poor but respectable English family of the middle class, who keep school for a living, and run the risk of introducing some help into the kitchen. The story is amusing to Americans, since it shows us the interior of a small English family's social life. For this reason it is fresh upon this side of the Atlantic, and will be read in many households with pleasure. The lesson taught is a good one. The book is pure, wholesome and pleasing.

The Land of Desolation.—By ISAAC I. HAYES, M.D. New York: Harper & Brothers.

This is a narrative of personal observation and adventure in Greenland, made with WM. BRADFORD, the artist, in the summer of 1869. We have heard the story from Dr. HAYES' lips, and have seen the original photographs from which the illustrations for this book were made. The whole narrative is deeply interesting, besides being true, and may be depended upon as authentic. The pictures are very pleasing, and the work has much scientific value, especially in relation to the glaciers and ice-bergs.

Allegories of Life.—By Mrs. J. S. ADAMS. Boston: Lee & Shepard.

A VERY pleasant book to read, each allegory, of which there are twenty-three, teaching a good lesson. In the first story of "The Bells," for instance, the lesson of discontent and its consequences, is told in a very graceful manner. A fine book for a present to a young woman. Among the allegories are those of the Light, the Pilgrim, Faith, Hope, the Oak, the Tree, the Wind, etc.

Can the Old Love?—A Novel. By ZADEL BARNES BUDDINGTON. Boston: James R. Osgood.

AN interesting story of English life, pleasantly written. It teaches the truth that old hearts need not be cold ones. There is a fair, free hereafter of eternal truth, wherein all souls shall find what life and love do fully mean. This novel is as readable for people in the down hill of life as for young folks. It makes a book of 200 pages, in large type.

Bits of Travel.—By H. H. Boston: James R. Osgood & Co.

A RARE, delicious little volume, full of quaint, old-world lore. H. H. is a sprightly, absorbing writer, and she did not travel over Europe for nothing. The first chapter, "A German Landlady," is so romantic and odd, it will lead the reader to peruse the whole volume. A pleasanter book of travels has not come from the press in months.

Schools and Schoolmasters.—From the writings of CHARLES DICKENS. Edited by T. G. CHAPMAN, M.A. New York: A. S. Barnes & Company.

A COMPILATION, consisting of selections from "Dotheboy's Hall," "The School at Dr. Blimber's," "The School at Salem House," and "The School at Dr. Strong's." There are illustrations from CRUIKSHANK, and the whole makes a volume of 315 pages.

New Publications.

Business "	2.50	"
Reading "	3.00	"

All orders for Advertising received at the New York office on or before April 1st will be charged at present rates only. For at least one cogent reason for our advance, or "New Departure," in Advertising Rates, see last number.

PUBLIC CORRUPTION.

THE developments of the past hundred days indicate an amount of corruption in official circles absolutely startling; and yet there are few well informed persons who will not say, "I told you so." The truth is, the causes for the venality of public men are not altogether inherent in themselves. Charity and Truth compel us to say that these causes must be looked for, and will be found, in the body politic—in the system which gives men place and power. Let us name what we think are some of the reasons why official corruption exists:

I. One is the manner in which public servants are chosen, involving, as it does, the expenditure, with the knowledge and assent of voters, of more money to secure a nomination and election to office than can be replaced by the nominal salaries or legal revenues to which such officers are entitled. For instance, a man who runs for a seat in the Legislature, is compelled to spend $2,000 or $3,000 to secure his own election. His legal wages per diem are more than consumed by the cost of daily living. Thus he gives his time, labor, knowledge, ability, as a legislator, for nothing, or must receive his recompense from what are called illegitimate sources. The same applies to members of Congress. And yet a proposition to reimburse his expenditures and compensate him adequately for his services, from the public treasury, is sure to arouse the indignation of the virtuous and frugal people! It will be at once urged in response to such a proposition, that such pay for legislative labor will cause a general rush for office, a prolongation of legislative sessions, and a depletion of the public funds. But the people seem to forget that this inadequate pay is a bid for corrupt and unscrupulous demagogues to seek official place, and that it shuts the door of public office in the faces of honest and capable men, who strive to live upright lives and preserve their names free from all taint of dishonesty and dishonor. They also forget that every dollar these men may receive, legitimately or otherwise, in consideration of their legislative services, comes directly or indirectly, ultimately and surely, out of the pockets of the tax-paying population—out of the products of the labor of the working classes. Adequate pay for honest, faithful services, in all departments of the public business, is the wisest policy and truest economy.

II. The venality of the people themselves, as indicated by their unscrupulous efforts to seduce and corrupt those who serve them, is another and potent reason for the prevalence of official corruption. Inadequate pay predisposes the official to succumb to temptation. Honorable men, so-called, and men holding high social and business position, do not hesitate to tempt the public's servants to aid them in evading legal imposts, and in defrauding the Government of its revenues. These honorable men, among all classes of society, engaged in all kinds of business, wearing the sanctified garments of respectability and integrity, hesitate not to serve their individual interests directly, or through the agency of supple and willing tools, by purchasing the services, or closing the eyes, of the elected guardians of the public coffers—stealing the public funds and sharing with the said officials the results of their robberies.

III. Laws are made that they may be evaded. Necessarily a class of men enact laws who are interested in their evasion by the people—laws which it is the apparent interest of the people to evade. There is little or no respect for law. If it operates oppressively upon any person or class of persons, its execution is suspended (too frequently) by the executive officers of the Government—for a consideration. People laugh at such laws. The honest few complain and clamor for repeal, but the individual interests of those whose duty it is to execute it lie in opposing its repeal and levying tribute upon those who are willing to pay for their aid in evading it. As many laws are enacted in the interest of these professional blackmailers and robbers, called politicians, as are enacted *pro bono publico*—probably more.

It seems to us that these three reasons are sufficient to account for all the evils in the administration of public affairs, of which there is complaint. They must suggest their own remedies. Is there hope of reform? We fear not, except by a complete subsoiling of the foundations of society as it exists—except in a radical social revolution, morally, and hence politically. We have no mode of reform to suggest. We believe this disease is one that must, or will, sooner or later, cure itself. Whether it will be done peacefully or not, we cannot say; but we apprehend that the revolution which must come will be violent, as it must be aggressive. There is no natural or other general law that is not broken by modern society daily. There is never any natural or moral law broken which does not involve a penalty, sure to be exacted of those who break it. Thoughtful, dispassionate, calm observers see and know this, and predict, with reason, we think, a future of disorder, anarchy, revolution, and finally of Regeneration.

RURAL NOTES AND QUERIES.

The Agricultural Convention at Washington.—On another page we give a record of what was done at Washington the first two days of the Convention called by the Commissioner of Agriculture. The Convention embraced some of the most prominent agriculturists, horticulturists, and agricultural educators in the country. Some pronounce it a failure; but those who do, either were not there or did not faithfully take part in or carefully analyze the material of which the Convention was composed and its proceedings. That it was a failure is something that can only be decided by results. It is too soon to expect these. As an expression of the current thought and purpose of the active, thinking, working men in the cause of agricultural progress and education, upon topics which must be considered, it was a success. We have rarely seen a finer body of representative men together. Their deliberations were decorous, dignified and liberal. True, there were axes to be ground; but when is it not the case in such a body? The theory that the men present were convened to foster the plans and purposes of the Commissioner of Agriculture is sufficiently answered by the fact that he "washed his hands" of them, and of the "folly" they committed. The fact is that no member of the Convention figured so poorly and made so weak an impression upon those present as the venerable Commissioner. The delegation from his own State were not slow to concede this.

The United States Agricultural Society is to be resuscitated. We know of no good reason, in the light of its past history, for galvanizing it; but it may be that those interested and active in its regeneration may make it useful. We hope so. In the action for re-organization at Washington, a few days since, BENJ. PERLEY POORE was re-elected, or re-suggested, as Secretary, and the name of W. G. BECKWITH, President of the Michigan State Agricultural Society, was suggested for the Presidency. Its plans, if it has any, are as yet undeveloped, and it is too soon to determine the status it will assume in relation to other agricultural societies. It looks to us much like attaching a fifth wheel to a coach; but we waive all expression of opinion until we are better posted as to its purposes.

Catalogues of the Mt. Hope Nurseries.—We have received from Messrs. ELLWANGER & BARRY, of the celebrated Mt. Hope Nurseries, Rochester, N. Y., their new series of Spring Catalogues, as follows:—No. 1, Descriptive Catalogue of Fruits—20th Edition. No. 2, Descriptive Catalogue of Ornamental Trees, Shrubs, Roses, Flowering Plants, Etc., Etc—21st Edition. No. 3, Descriptive Catalogue of Plants—Arranged in Classes. No. 4, Wholesale Catalogue of the Mt. Hope Nurseries, Rochester, N. Y.—for the Spring of 1872. Like all the Catalogues of the Mt. Hope Nurseries, these are admirably arranged, illustrated and printed.

The Sunday Trade in Live Stock.—We notice that the butchers, drovers, shippers, and feeders of live stock in Detroit have petitioned the Common Council of that city to prohibit the buying, selling, weighing, and shipping of live stock in that city on Sunday. It is a disgrace to American civilization that in several of the large live stock markets of this country a large business is done on Sunday. Our friend MILY MORGAN, Live Stock Reporter for the New York Times, has been active in the effort to correct this outrage in this city. She ought to have the co-operation of every drover, shipper and butcher who does business here, on the ground of self-interest, if for no higher reason.

The Wisconsin Agricultural Convention, at Madison, Feb. 8th, judging from the reports received, was a practical success, and a meeting of much profit to those present. Some most excellent papers were read, and interesting discussions followed. We congratulate our friend, GEO. E. MORROW, President of the Convention, and the man most active in calling it together, upon the success of his effort to be useful to the farmers of Wisconsin. We hope they will properly recognize his zeal in their behalf.

Massachusetts Ag. College.—At a recent meeting of the Trustees of this Institution, H. J. Clark of Lexington, Ky., was elected Professor of Veterinary Science, including Human Anatomy, Physiology, Zoology, Comparative Anatomy and the use of the Compound Microscope. The Board of Trustees elected the following officers. *Pres.*—Gov. WASHBURN. *Vice-Pres.*—Pres. Wm. S. Clark. *Sec.*—Charles L. Flint. *Treas.* Dr. Nathan Durfee. *Auditor*—Judge Henry Colt.

Flower and Vegetable Seeds.—We are indebted to H. H. DREER, Seedsman, of Philadelphia, for packages of choice Flower and Vegetable Seeds. They will be sown with entire faith in their purity and genuineness, for Mr. DREER'S reputation guarantees that.

THE SEASON.

Salem, Neb., Feb. 6.—We are having a very severe winter. Fall wheat is worth $1.30 per bushel; spring wheat, $1; oats, 18c.; corn, 16c.; barley, 50c.; potatoes, 4c. per lb.—J. W.

Bentonville, Benton Co., Ark., Feb. 7.—Weather cold. Thermometer 2° below zero. Health good. We invite those who want homes in the West to come and see our country. We have good land, good fruit, good water, and good society. We want more capital.—R. N. C.

San Sota, Texas, Feb. 16.—This has been one of the coldest falls and winters we have had for a long time. Wheat looks well. Corn is worth $2 per bushel; flour, $15 per bbl.; bacon, 12c. per lb.; butter, 40c. per lb.; cheese, 25c per lb.; coffee, 25c. per lb.; farm hands, $1 per day. Many emigrants coming in.—J. W. F.

Independence, Behoman Co., Iowa, Feb. 9.—We have had a very even winter; froze up about the middle of November; had a fall of snow the 25th; good sleighing Thanksgiving day, and it has thawed only one day since. Snow is about 1½ feet deep in the woods, and badly drifted on the prairie. Stock is generally looking well. A large amount of fat stock in this vicinity—both hogs and cattle. Hogs worth 3 to 3½c. per lb., live; dressed, 4½c.; live cattle, 2½ to 3½c.; wheat, 95c. to $1; corn, 20c.; oats, 25c. Our country is settling up very fast. Wild prairie is worth from $10 to $15 per acre; improved farms, $20 to $50 per acre, according to improvements. We can brag of as healthy a country as there is in the world.—R. M. H.

RURAL BREVITIES.

A CORRESPONDENT at Norwich, Ct., asks if any one has young deer for sale.

THE Massachusetts Poultry Association is to hold an exhibition in Music Hall, Boston, Feb. 27, 28, 29 and March 1.

CHARLES SINCLAIR can obtain Entomological Pins, by addressing J. Akurst, 19 Prospect street, Brooklyn, N. Y.

IF Sophronia Longmire will send us the plants and flowers for which she desires names, we will try to name them for her.

THE Senate of Illinois has refused to appropriate $75,000 to complete the main building of the Illinois Industrial University.

A CORRESPONDENT who asks for the name of an advertiser who sells mills for crushing and pulverizing bones, is informed that Baugh & Sons, Philadelphia, Pa., advertise the same.

WE notice that a movement is making for holding a great fair of Southern products in New York city next fall. It is proposed to organize in each of the Southern States for this purpose.

ALSIKE CLOVER seed can probably be obtained of any of our seed advertisers, who will give the price on application. In a dry climate we do not think it can be preferred to red clover. In a moist climate it may be preferable.

H. M. DARLING is informed that we will not undertake to say which is *the* best work on vegetable gardening; but we know that QUINN'S "Money in the Garden," and HENDERSON'S "Gardening for Profit," are both good.

GRANGES of Patrons of Husbandry are organizing in the South. Some of the Southern Agricultural papers are opposing it, on the foolish ground that it is a Northern institution. Why don't they oppose the introduction of valuable tools and machinery for the same reason?

GEORGE E. MORROW of the Western Farmer, Madison, Wis., Secretary of the North-western Dairymens' Association, is desirous of receiving from every Cheese and Butter Factory in the North-west, full reports of business for the year of 1871, for the forthcoming Report of the Association.

VERMONT farmers find the cost of cultivating the sugar beet about the same as that of an equal amount of land in corn; the crop is at the rate of 600 bushels per acre, at a cost of four to five cents per bushel. If that is so, it is the place for producing sugar beets.

BUSINESS INFORMATION.

The Charter Oak Life Ins. Co. of Hartford, Conn., is well known as one of the oldest and most substantial institutions of its kind in the country. It has been most carefully managed during its business career of over twenty-one years. Though one of the most conservative companies in existence, it has always lead in matters of improvement in the science of Life Insurance, and is the originator of many of the most valuable features added to the business during the past few years. It now presents a new plan, which is highly commended. This plan, *Deposit Insurance*, is claimed to possess some very marked improvements over any other plan of insurance with which we are acquainted. To those "who live long and prosper" it yields very handsome returns as an investment, and to those who die it affords the benefits of insurance at rates far below those elsewhere offered on any short endowments, for which this is a substitute. But its chief and admirable provision is for the withdrawal of payments, by those who desire so to do, at the end of any policy year. The amount allowed to be withdrawn is definitely specified for each year, and is a very large proportion of the total payments to the Company. We are confident that in advising our readers to investigate this plan we are doing them a service. The Company or its Agents will afford full information of the plan to any one addressing them on the subject.

Paper Houses.—These houses are attracting much attention. In response to inquiries as to cheap houses, a correspondent of a city paper makes these suggestions:

"Houses are now composed very largely of paper—the best known non-conductor of heat, cold, and dampness. The frame is covered on the outside with a heavy, compact paper, weighing nearly two pounds to the square yard. This, when covered with siding, makes a warmer and much cheaper covering than boards. The rafters are covered with rough boards, upon which is laid what is called a double thick roofing-paper, being made very heavy in one web, so that the wind can have no effect in uplifting it. This foundation, when covered with mineral paint or cement, makes a substantial and perfectly reliable roof, for about three dollars a square—less than one-half the ordinary cost. The inside walls and ceilings are covered with 'Prepared Plastering Board,' applied instead of lath and plaster, at a cost of less than twelve cents a square yard. It makes a perfectly smooth and substantial wall or ceiling. Thus, with the exception of the frame, siding, floor, and doors, you have essentially a paper house, in every way as durable, warm, and vastly cheaper than the same can be furnished in any other way."

Successful Accident Insurance.—The Travelers, of Hartford, issued 31,797 general accident policies last year, making a gain in net premiums over the previous year of nearly $100,000. Up to Jan. 1, it had written a total of 234,554 accident policies, and paid 11,248 claims of policy holders, for death or injury by accident, averaging nearly seven hundred dollars a day for the whole time the company has been in business. We are insured in the Travelers, and consider the Company entitled to confidence.

PUBLISHER'S SPECIAL NOTICES.

The Rural New-Yorker is electrotyped, and hence Back Numbers can always be supplied. Copies for sale by all News Dealers; price Six Cents.

March on During March!—Is what all our Agents, and others disposed to form Clubs, should do. It will not only pay to enlarge present Clubs but to form new ones. It is an easy matter to recruit for the new style RURAL, and PAYS both Agent and Subscribers—and now is the best time to do "that same."

Form New Clubs!—Now is a good time to form new clubs. Agents and Subscribers (both new and old) can do this with little effort—and secure good pay in the shape of Premiums. New subscribers can begin at the time of subscribing, or with year and volume—thus securing all of the Thrilling Romance we are publishing, beside many excellent articles and beautiful illustrations.

No Traveling Agents are employed by us, but any person so disposed can act as Local Agent, on his or her own authority, and secure premiums, etc.

Show Bills, Specimen Numbers, Etc., of the RURAL NEW-YORKER sent free.

BUSINESS NOTICES.

DR. STRONG'S REMEDIAL INSTITUTE,

Saratoga Springs, N. Y., is unsurpassed in the treatment of Lung, Female and Chronic Diseases. Turkish, Russian, Electro-Thermal and Sulphur-Air Baths, Hydropathy, Vacuum Treatment, Movement Cure, Oxygen, Calisthenics, &c. TERMS LOWEST IN WINTER. Send for a Circular. Endorsed by Bishop Janes, Rev. T. L. Cuyler, D. D., and Tayler Lewis, LL. D.

Attend to the First Symptoms of Consumption, and check the disease in its incipiency by using JAYNE'S EXPECTORANT, a safe remedy for all affections of the Lungs and Bronchia.

HOW TO OBTAIN A "COLLINS"

Solid *Cast* Cast-Steel Plow for $5. For particulars, address COLLINS & CO., 212 Water St., N. Y.

The Qualities of Burnett's Cocoaine, as preventing the hair from falling, are remarkable.

"MAKING LOVE."

THE accompanying charming picture is from the Illustrated London News, which comments upon it in this wise:—This is properly a sentimental business; but the gravity here is, if we judge only by outward gesture and expression, entirely on the gentleman's side. "Gentleman" we may safely call the good-looking admirer of this pretty girl; for let but a peasant be possessed with true love—let him but be so deeply enamored as this young fellow evidently is—and no prince of the land will be more chivalrous towards at least one of the fair sex. But does the girl herself, with all her apparent light-heartedness, and the arch gaiety of her winning smile, really regard the love-making as a less serious business than her suitor? Very probably not; know all ye young men in similar case that most young ladies are adepts in the art of concealment! In this instance the girl is lending a willing ear, which is one great point gained. And more of her secret may be discoverable in the flaxen thread which, we venture to say, is being wound from the distaff much less speedily and regularly than usual. But—like, perchance, the girl herself—we are getting to a knotty point, and must leave pretty MARGUERITE'S secret to be discovered by her wooer—who is assuredly no FAUST; with the hope that the course of true love may for once run smooth. We have only to add that this charming picture is by the distinguished German artist, Herr C. LASCH, and that it is very popular in Germany through the medium of photography.

A SOUTH AMERICAN FARM.

ON our first page we give a view of a South American Farm in the district of Bahia Blanca, Buenos Ayres, where is found a colony of English farmers—men of capital and education. The climate is mild, dry, and windy, the temperature resembling that of Lisbon and Naples. The soil is fertile and the land covered with a hard, coarse grass, on the hills, and a finer one in the low-lands and valleys. The upper sketch in our illustration represents the highest points of Sierra Ventana.

These hills abound in quartz and in stone suitable for paving and whetstones. A number of streams flow from these mountains; trees, chiefly the red willow, and a tangled mass of grasses and creepers grow on the banks; the Pampas grass here grows luxuriantly, attaining a hight of from ten to fifteen feet. The water of these streams is of excellent quality, being pure, sweet, and very soft. In the streams running South no fish exist, while in those taking a Northerly course they are to be found in abundance.

The sketch on the left represents the house of Messrs. MILDRED & Co., the first English settlers in the neighborhood, who possess twelve square leagues of land, upon which they are establishing sheep runs, outfarms, and leasing to tenants. They have improved agricultural implements, gardens, lucerne fields, 400 acres in wheat, which this region produces at an average of 22 to 25 bushels per acre, of excellent quality. Barley does well, also, but does not pay as well as wheat. The climate is too cool and dry for Indian corn, but oats, beans, &c., are grown. Lucerne, however, is a most profitable forage crop, since on the lowlands it yields several cuttings in the year. The sketches in the centre of the picture illustrate features of life on these farms—the herdsman with his lasso, in full chase, and characters that belong to the farms.

Below is a view of the farm as a whole, with its background of hills, and the beautiful valley, as seen from an elevation in front. Life here is healthy, happy, and free and independent. Englishmen accustomed to the comforts and luxuries of an English home, turn out at sunrise, take a cup of tea, coffee, or *mate*, a mouthful of biscuit and cold meat, gallop to the river, and indulge in a bath, and then plow until eleven o'clock, when they breakfast upon roast or boiled meat, vegetables, tea and biscuit, which is followed by a pipe, a chat and a siesta in summer time till 2 P. M., when plowing or other work is resumed till time for another swim, the gathering up of sheep, horses, etc., before supper.

Many more would have settled in this country had the Buenos Ayres Government granted greater facilities for acquiring land; as it is, numbers are steadily added to the colonists, and they are said to be contented and happy.

Our Story-Teller.

BEFORE AND AFTER.

A THRILLING ROMANCE OF THE WAR FOR THE UNION.

Written Expressly for Moore's Rural New-Yorker, BY TWO WELL-KNOWN AUTHORS.

[Continued from page 138.]

VII.—Hope's Home.

"A LETTER for you, Miss HOPE."

HOPE ARNOLD was in her own pretty room, in her father's house on Madison avenue, in the great city of New York. She was alone, as she often was in these twilight days preceding the night of war. Society and gayeties of all kinds had lost all charms for her. She craved solitude; time to think of the new and strange forces that had entered her life. On this January evening she sat before the open fire and watched the pictures that formed themselves in the glowing coals,—pictures of the pleasant, hospitable, Southern life that she had so lately left. She lived over in memory the past few weeks, and all around her were the faces of the friends that she might never see again. She saw the genial, affectionate host, her father's old-time friend and college chum; dear, bright, willful, loving MAGGIE; impulsive, joyous, fresh-hearted GEORGE; ALFRED, her own good, tender-hearted boy, and reliant, thorough gentleman, in one; old HANNIBAL, with the tears running down his black face at the thought of losing her; Mrs. HEATHERSTONE on her sofa; SUSAN ministering to her mistress; Mr. BRAYTON restless and anxious, yet trying to make everybody as happy as possible. What were they all doing? Were they in the warm, bright library, grouped about, reading the newspapers and talking about the war? The war! Ah, that hurt! She had been thinking of this family as friends, and yet the war that was surely coming would separate them as fatally as death. What had she to do with men and women whose blood that very night was leaping high against the cause which her brothers stood ready to defend with their lives. Yet they were her friends. She could not, she would not try to untangle this terrible web of circumstances, but she was sure that North and South alike were held in GOD'S merciful hand, and that only His will would be worked by both. Nobody should call the HEATHERSTONES traitors. They would all be true to the best that was in them—she was sure of that, and there the matter should rest.

"A letter for you, Miss HOPE."

Twice had the servant made this announcement before HOPE realized his presence.

"MAKING LOVE."—By C. LASCH.

"Yes, JAMES, thank you," said she, with a warm flush in her cheek as she recognized ALFRED'S handwriting. In a moment more she had taken in all the dreadful news. Col. HEATHERSTONE was dead—ALFRED'S father, MAGGIE'S father—her dear, good friend, was dead! The circle was broken. The desolation was begun. Why had she come away so soon? She might have comforted them. What would they all do?—and HOPE, no longer able to strive against the sensitiveness of her highly-wrought condition, gave way to the only consolation that would avail her—the consolation of tears.

HOPE'S father was a Yankee. The word Yankee has different meanings to different ears. To some it means shrewdness, sharpness, thrift, and little else. To others these qualities are but the incidents of the Yankee character, the base of which is strength, and the proportions broad and high, if not entirely harmonious. In estimating the New England character, men have largely left out of account the fact that it takes time to make anything worth having. They have not valued at its worth the granite, which after all is capable of a higher polish than most materials, but which needs many strokes of the chisel to fashion it into beauty. When the reorganization of elements, now going on in America, has reached a result, we shall find that the puritan is the base of the new combination. The metaphysical insight of the German, the fineness and sensitiveness of the French-

man, the fire of the Irishman, will be superadded, and then we shall have a man. In the meantime we see now and then one of these proportioned characters, given as if to keep the world's heart up, and generally, not always, they are of New England origin. HOPE'S father was one of these. Built on a large scale, what was meant in him for virtue, did not through a stunted growth become a vice. His pride and his strength were the back-bone of his love, and not its tyrants. His heart was the center of his moral circulation, and his brain was the cool business agent of the concern, under the heart's inspiration. HOPE was her father's own child, and between the two was the rare love born of true sympathy. Her mother had died when she was an infant, leaving two sons besides the baby daughter, and HOPE had grown to womanhood, moulded, by her peculiar household relations, into a lovely combination of beauty and strength. She was the companion and the child, the mother and the petted sister.

Mr. ARNOLD and his eldest son were partners in a large mercantile house, the success of which had been unvarying for so many years, that its neighbors looked upon it as the personification of power and trustworthiness. Like many large houses in the North, the business extended its branches through the Southern States, and the threat of rupture between North and South was equally a threat against the prosperity of the ARNOLDS, and thousands like them.

At this time Mr. ARNOLD'S house was a sort of a center for a certain phase of patriotism. The spirit which finds itself at home in an atmosphere of ideal heroism, the enthusiasm which in common times is thought to be womanish and unworthy of man, but which in times of great ferment is known to belong to the atmosphere of the soul, found in this house a congenial home in which to collect itself and radiate its power. Father and sons were ready for any sacrifice, for they saw clearly and truly what was at stake, and to such visious sacrifice is not hard. They were enthusiastic, but their enthusiasm had a self-poise, in strange contrast to the swaying waves of feeling in the HEATHERSTONE family—a self-poise always resulting from an intelligent consciousness of a solid foundation of right. The HEATHERSTONES, indeed, believed themselves to be right, but they could not demonstrate their proposition by the rules of GOD'S arithmetic, as could the ARNOLDS, and for this very reason stood, even among themselves, upon various platforms, corresponding to the moral development of the individuals.

While HOPE was absent in Virginia many changes had quietly taken place in the spiritual conditions of her home and circle; the great change in her own soul has already been recorded; she thus found herself, in a certain sense, another woman in another world. She met her father and brothers with a new meaning in her face, and read new meanings in their faces. The step which HOPE and ALFRED had taken was, of course, at first, a great surprise in HOPE'S own home. It was, too, at first, a disappointment. Mr. ARNOLD'S first thought was, "Is my daughter the betrothed of a rebel at the very opening of the conflict?" His second thought was that a man cannot be really a rebel, except in his heart, and he knew that truer heart never beat than ALFRED HEATHERSTONE'S. He knew that if there was alloy, the gold tried in the fire of life's discipline would soon work itself clear, and so, after the first hesitation, he took ALFRED to his heart, as the future husband of his darling. Harmony comes quickly to natures pitched upon one key. ALFRED was a Virginian, and had made no avowal of intention to take sides against the South, and the ARNOLDS were representative Northerners in their devotion to the central idea of this North, yet all were true-hearted gentlemen, and the short visit of the young lover was marred by no discords.

HOPE did not weep long over ALFRED'S letter. With strong natures tears are a momentary relief, but never an indulgence, and HOPE was rapidly gaining that strength which yields to motion, only that it may refresh itself for greater efforts and greater endurance. Her first thought was to tell her father of the sad news, and she sought him in the library, where he was consulting with PHILIP, the eldest son, on some matter evidently absorbing to both. In answer to Mr. ARNOLD'S "Come in," HOPE entered and seated herself languidly by the open fire, to wait till her father and brother had finished the matter in hand.

She was watching the glowing coals, and yielding a little to the sense of physical comfort, when she heard the words from her father's lips:

"There's no use in trying to fight against nature. If we insist on NED'S going back to Harvard, it will only result in his leaving college and going directly to the army without asking consent."

"O, father," cried HOPE, starting up, her voice full of pain; "Has it come to this? Is NED really not going back to college? Father, father, heroism is grand, but it is hard. He must not be hindered; but how shall we bear to see him go?"

"We mustn't anticipate, HOPE. Help will come at the moment of need. You have been weeping, already, my child. Our bright HOPE must not veil herself in the clouds, or we shall mistake her for Grief."

"I had forgotten, father; NED has put all other thoughts out of my mind. Here is a letter from ALFRED. Col. HEATHERSTONE is dead!"

Absorbed as were the ARNOLDS with the complications of their own life at this trying juncture, HOPE'S news fell on their ears like a thunder clap. Bright, impulsive, electric, Col. HEATHERSTONE was a man whose death is a fact hard to accept. Totally unlike Mr. ARNOLD, except in the basis of generous honor that both possessed, the two were tender friends, bound together by the magnetic sympathy that opposite natures hold for each other. "Dead!" mused the strong man, his voice broken with grief, "dead! I can't make it real. What must the house be without him. And yet how much he is saved. He will have no more conflict between the lesser and the greater patriotism. The question is solved with him, the struggle over; for, say what we will, in all noble hearts, there can be no defence of State Rights against the nation without inward struggle. The hand that is raised against the old flag will tremble, however nerved, with love of home."

"Yes father, he's saved much," said HOPE; "but what will they do without him? Poor little Maggie! her father dead, and her brothers in the army. ALFRED writes me, in this very letter, that his course is taken. He will join some regiment as surgeon, the regiment that his brother enlists in, if possible. Thank GOD that there is a course for him to take that does not involve fighting. In this way he can satisfy his heart and conscience."

"But," said PHILIP, "if the cause is wrong, oughtn't he to take sides openly against it?"

"He doesn't yet see it so, dear PHILIP," said HOPE, gently.

"And in the meantime we'll not say what is his duty," answered Mr. ARNOLD. "A man's duty is always that which, with honest, earnest desire, he decides to be his duty. To the man on the stair above him he may be wrong. But the second man may be equally wrong to the third man above him. In this large sense, at least, ALFRED is right; and to me it is a relief that his conscience does not force him to do that which would be such a blow to his family in this, their time of need."

As a matter of course HOPE was kept constantly informed of the HEATHERSTONE affairs, and the news of GEORGE'S enlistment, recorded in the last chapter, did not surprise her, aware as she was of his eagerness to join the army, and to be in the midst of whatever danger or triumph might befall it.

VIII.—Brother and Lover.

MARGARET HEATHERSTONE'S position was a very lonely one. ALFRED had at last succumbed to the pressure of circumstances, and had joined the rebel army as surgeon. This was a terrible blow to the fond sister. For days, and even weeks, HANNIBAL'S titbits of philosophy fell upon deaf ears. That cloud had no silver lining. HARRY did all in his power to comfort her, but the girl seemed wholly changed, and Mr. BRAYTON, who had remained with the family, according to promise, until the Colonel's affairs were satisfactorily settled, looked upon his little friend with great anxiety. There were no outbursts of grief, no repinings, no looking back into the past—only a strange, dreadful peering into the future,—never, however, expressed by word or even action. Oh! the depth and weariness of those sad eyes, that seemed trying to fathom the mysteries of the far off somewhere—when war should cease, and—and—but MARGARET never went further than this, even in imagination. She knew that her home never would be the same; no one realized more vividly than she the desolation in store for her; and so the dear eyes looked over and beyond—and MARGARET wept and prayed, and hoped only for her country,—she had no hope for herself. HARRY remained with her most of the time, and never was lover more thoughtful and tender; but as the weeks rolled by, and the demand for men became urgent, he grew restless and nervous, and finally decided that, come what might, he would no longer sacrifice patriotism to love. This question the brave fellow would have settled at first, but for MARGARET'S unprotected position. The thought of leaving her was a thousand times more than death; but duty called, and he fully realized that a longer delay would be construed into nothing less than cowardice. HARRY'S father and brother were already in active service, and he must follow.

"Bad news, dear?" said MARGARET, tenderly, as early one bright morning her lover presented himself. Poor HARRY! He had never been quite sure that MARGARET fully reciprocated his passion; but now he knew that the truth must certainly come to the surface. The graceful badinage with which she had always met his earnest protestations would not avail her at this trying moment. More than all else did HARRY tremble for his love. That secured, he could fight and conquer; that in doubt, he could fight, to be sure, but what would be victory under such circumstances?

"Here is a letter from ALFRED, and I have just received this from father," replied HARRY, passing over both documents. "Tell me, please, what you think of father's communication;" and the young man watched the face by his side reblen and pale, and the nerves twitch convulsively, as she heroically read it through.

"Your father says you must delay no longer," she whispered, clasping her hands for a moment in agony. "That love has no right to keep a man chained at such a crisis as this," she continued, slowly.

"Yes, those are his words," replied HARRY.

"And you, HARRY TRAVERSE, what do *you* say?" and MARGARET arose, took her lover's head between her trembling hands and looked down into his eyes with an expression which HARRY never could forget—an expression which confronted him in battle and in hospital, the acme of renunciation, the giving up of the last hope. "You need not reply to me," she said, in a whisper; "you are going; I know it. You think it will be cowardly to remain with your poor little MAGGIE any longer? Oh, Father in Heaven, be merciful, and strike me dead this instant!"

"Then you love me, MARGARET?" said HARRY, in a voice so firm and deep that MARGARET, crushed as she was, could not help wondering at the strange vitality of the tones.

"*Love* you?" answered MARGARET. "Love you? What a strange question to ask at such a time as this. Have you not always known that I loved you?"

"No, MARGARET, no! As I hope for salvation, no. I have dared to trust that at some time I might, by patience and devotion, earn a full return of the heart so long in your keeping. MAGGIE, darling, this is too much! You love me? Love me as I love you—deeply, devotedly, unalterably. I can bear anything now—separation, disaster, death even! Ah, little one, I am inclined to believe that GOD, in His mercy, kept this knowledge from me, in order to make this parting endurable! But why don't you speak to me? Lift your head and let me look into those dear eyes, and tell you all I feel! No answer? I shall come back to you, MAGGIE; we shall yet be happy together—oh, *so* happy! This parting is only for a short time."

Still no answer. HARRY lifted the head from its resting place on his shoulder, only to find his companion unconscious. This last blow was more than the loving heart could bear, and nature had at last succumbed. SUSAN came in with restoratives, and HARRY lingered by the side of his darling, coaxing, pleading, imploring her to speak to him.

"This means that you are going away, Master HARRY," said the octoroon, in her usual monotone.

"Yes, SUSAN—going away. But, for Heaven's sake, restore her quickly; I am afraid she will die."

"Do not fear, Master HARRY; the heart does not break so easily. She will wake soon enough to life and suffering."

MARGARET gasped helplessly, and caught at the last words with her returning consciousness.

"Life and suffering," she repeated, "life and suffering. They mean the same thing, don't they SUSAN?"

"They have meant the same thing to me for a great many years, Miss MAGGIE."

"Don't speak in that despairing way, MAGGIE darling. I shall come back to you. The war can't last more than a few months at most, and then we shall all be happy again."

"We shall never be as we have been, HARRY. The past is past forever. I trust that you will return, darling; but forebodings that amount to prophecies assure me that there is a long and desperate struggle before us. What, I cannot tell. It is all so vague, that I get no distinct conception of anything but clouds and darkness. Kiss me now, HARRY, and leave me. We will talk this all over by-and-by, when I feel a little better. Put your arms round me, SUSAN. You rest me. You have suffered too. Dear SUSAN, tell me, is all this a punishment for keeping you, and such as you in slavery."

"You have not kept me in slavery, Miss MAGGIE. Better not think about the why."

"But I can't help thinking. Last night, SUSAN, I read this in my little Testament: "If one member suffer, all the members suffer with it. I suddenly saw what that meant, dear SUSAN. We are all one great body; and though I am only a little finger, and have had nothing to do with beginning slavery, yet I must suffer because I am a member of the body."

At this moment a little bundle of wool and ivory was thrust through the door, and conveyed the intelligence that

"Missus done got the headache drefful, and want SUSAN dis minute."

"Go to Mamma, SUSAN," said MARGARET, "and send HARRY to me in half an hour."

How MARGARET spent the half hour is known only to GOD and herself; but when HARRY was called back to her presence, another face than MARGARET'S seemed to look into his. It was pale and sad, and bore the traces of tears, but the light of resignation shone in the wondrously beautiful eyes, and the firm mouth was firmer than ever. A few moments had changed the timorous, shrinking girl into the calm, resolute woman, and HARRY looked and wondered.

"When do you go, dear?" were the first words that greeted him.

"To-morrow morning, MAGGIE." And the man's lips quivered as he looked into the eyes of his best beloved, and thought of the terrible future that might be in store for her.

"Then please go now, darling," she whispered, leaning her head on his shoulder. "You need all the time to make your preparations, and I am strong now. Kiss me, and ask GOD to hold me close to his heart; and remember all the time that your little MAGGIE loves you as she never loved before—loves you with her whole soul! Good-by, love, and GOD bless you!"

One sob, one wail of agony, and HARRY TRAVERSE was alone. [To be continued.

A LOVING heart and pleasant countenance are commodities which a man should never fail to take home with him. They will best season his food and soften his pillow. It were a great thing for a man that his wife and children could truly say to him, "He never brought a frown of unhappiness across his threshhold."

KEEP your store of smiles and your kind thoughts for home, give to the world only those which are to spare, and, thus you will always have some to spare.

Sabbath Reading.

WHERE?

BY MARIE S. LADD.

O WHERE beneath the skies,
The blue and beaming skies,
So rife with change and death
That half the weary breath
Must spend itself in sighs;

O where can mortals find
Ease for the troubled mind;
The peace that brings sweet rest
Unto the weary breast;
The sight that helps the blind?

It surely is not here.—
We only have a tear
To wash away our pain,
And yet, there still remain
The struggles and the fear.

O then, beneath the skies
There can no good arise,
That comes not from on high,
It waits us ever nigh
This good that never dies.

WHAT THOU DOEST, DO QUICKLY.

As I sit here in this quiet evening, I seem to hear over and over again:—"What thou doest, do quickly." Do what I may, think what I *will* to think, still I hear the voice, as softly quiet as the room, "What thou doest, do quickly."

Why is it I cannot read? Why is it I cannot think what I will to think, without these words ever following me? And what do they mean? What have I to do? I have no talent, no gift of speech, no pen of a ready writer, no beauty of face, no sweetness of voice. I have nothing to do. Surely the voice is not for me. I fully believe in the law of compensation, but my case is the exception that proves the rule. I am here, and here I expect to remain until I die.

"Ah!" you say, "it seems sad to make no progress in life, and to find one's self no further on at the day of one's death, than at the day of one's birth." It is sad. How true that we cannot stand still as regards our physical development; we can grow as the trees and shrubs grow, because it is our nature to. But as to any real development of the inner life, year after year may roll around and find us on the same plane as the year before, or even lower down. How useless to spend a lifetime in fruitless experiments, to find out for what we are best fitted.

What splendidly-built castles were toppled over, when we found each experiment a failure, and the question still unsolved. How many times the vision glowed, and brightened, and shaped itself into many-colored clouds of beauty, and we watched the tints, so carefully and closely, and thought we caught glimpses of the dawning of a new life, when the gay clouds grew to somber hue, first gray, then black, and the vision faded. And as we sat motionless in the darkness, we only said:—"Well; it might have been," and thinking it only the explosion of a hitherto untried bubble of a new experiment.

Another test of lack of talent; if I had talent then I should see the fruit of what I do, for "every tree is known by its fruits." And, after sowing a few seeds by the wayside of this experimental life of ours, we sit with folded hands to watch if haply they might spring up. The seeds were sown with little faith, little trust and little watching as to where they fell. But they sprang up and brought forth fruit abundantly. What do you say; can seed like that bear fruit? Yes it can, and will, and did. But what kind of fruit was it? Can you expect "figs of thistles," or of "brambles gather they grapes?"

What was our consternation at beholding great weeds of error grown up strong and high, and shutting out the sunshine from the few sickly plants of truth that came up, and at last we could see no truth at all. But we have no excuse; there is no one who, if he sets to work to do "whatsoever his hand findeth to do, with all his might," but that will find he had one talent (be it ever so small) that he has kept buried in a napkin. If you have been lamenting over your unfitness, stop no longer; "What thou doest, do quickly, for the night cometh when no man can work." If you work well, you will say with the soldier who had fought his last battle—

"I lay me down and sleep,
With little thought or care
Whether my waking find me
Here or there."

But if the battle of life has not been fought, you have need to feel alarmed. We are not ready "*not to do*" until our half day's work is all done and our Father calls us to come up higher. Work, and work quickly; and, though often weary,

"We'll grasp His banner still,
Though all its stripes be dim;
These stripes, no less than stars,
Lead after Him." S.

Reading for the Young.

THE FAIRIES' BEST GIRL.

BY AMANDA T. JONES.

"YOUNG people will have their own way, in spite of their elders," said the dear fairy grumbler, Mrs. BANDETTE. "There's my daughter, now—who ought to be dancing, at her own gay will, under the morning glory vines and among the great red nasturtiums, this rich, sunshiny dawn—flying off to her dressing-room to get ready for a grand excursion with her lover, the pretty young Prince. They've heard of a great celebration of Sunday Schools, where ten millions of children will be seen, all dressed in white, with red ribbons in their hair, or, if they are boys, in braided blue jackets, with cockades in their hats. It may be ten thousand instead, or possibly ten hundred—I never could be quite sure about figures—but it is an awful number! If GETTELIN hadn't wings, I'm sure she would be crushed to death; but she has promised me she will fly high, and never once alight, except upon the head of the best girl there. It is most surprising how much she thinks of good girls." Here the little lady, who could never scold long, broke off suddenly, and burst into a merry warble—

"Oh! a fairy's life is sweet,
And a fairy's heart is gay;
Come, open your wings so fleet,
And away to the dance, away!

"On the edge of a lily red
Their tunes the pipers blow,
And the woven moss is spread
For the dancers just below.

"Hurry and hurry away,
Light be your dancing feet;
Oh, a fairy's heart is gay,
And a fairy's life is sweet!"

"Good-by, darling mamma," said rosy GETTELIN, flashing a look up at her mother from the face of a blue pansy, where she had alighted to plume her wings. "When I come back I'll bring you a picture of my best girl, for the Prince has learned to get photographs. We'll have her taken in a whole drift of sunbeams, so that she will look as much like a fairy as possible." At this the happy little lady nodded, laughed, and flew off, lightly, courtesying to her friend, Prince FANFANERO, who met her on the wing.

"How are we to know which is the best of all the good girls we shall see?" asked FANFANERO. "I shall be sure to pick out the prettiest, I am afraid."

"Perhaps," said GETTELIN, tossing her head, "you would never have picked *me* out, if I hadn't been pretty."

"Ah, but I did not know how you looked when I selected you," said the fairy lover; "I chanced to be flying hastily over a field, in order to reach your mother's before midnight, the time I was first invited to her palace, when I heard the softest voice in elf-land, singing bird-songs to a row of sleeping children in a little, new, windowless hut. 'There is the lady I mean to win for my bride,' said I; 'for her voice is sweeter than the tinkling of dew drops upon a silver wave, and her heart must be as rich with love as a grape with red wine.' I certainly thought you the loveliest of all the elves when you fluttered in so bashfully, through the cobweb curtains, and brought me a plate of new honey cakes and a goblet of mountain dew; but I did not know you were the singer I loved, until you sat down to your harp, afterward, and sang me that chorus about fairies and fountains."

And the Prince began to hum the melody over and over, as if he could never remember well enough the hour he first met GETTELIN:

"Rise, waters, rise!
Creep from the heart of a diamond cave,
Glide through the rocks in a voiceless wave,
Break into sunlight—glitter and lave
The daffodil's bed and the violet's grave,
Till they rise, all rise.

"Rise, fairies, rise,
The fountains are laughing aloud in the sun,
The flowers are blossoming, every one,
The shadows are fled and the day is begun,
Sleeping is over and dreaming is done,
So we rise, all rise.

"Hush!" said GETTELIN; "I hear the hum of voices—and look, O, look! There they come, hundreds upon hundreds, walking two and two. Oh, the beautiful, beautiful children! How I love them!"

The Prince laughed. "And how you would fly away from them, if they should once begin to quarrel!"

"Never fear to-day," answered GETTELIN, cheerfully; "I asked fairy SWEET-TEMPER last night if she would just fly across the crowd, with her silver bowl and evergreen bough, and sprinkle dew drops upon the children's heads, so they would never dream of getting angry all day long. See! there she flies down the lines! It seems to me the farthest ones look just a trifle cross, but those she has passed over are smiling, and she'll soon sprinkle them all."

On along the road marched the children, as lightly stepping as if they could fly if they chose, but found walking pleasanter; and on over their heads flew the two fairies, so near they might have touched them if they had lifted their hands. Marching, singing, nodding and smiling—all their curls blown about by a frolicsome wind, and their ribbons and cockade tassels fluttering like red birds; so went the children.

"There never was a prettier sight," said the fairy friends, "and there never will be."

But there was just one little girl who had not had a sprinkle from the evergreen bough, and GETTELIN had no sooner caught sight of her than she shrieked out like a frightened sparrow.

"What is the matter, dear?" asked her wondering companion. "I have been so busily admiring that little lady with the gold chain about her throat, that I did not see where you were looking."

"She is the very one that scared me," cried GETTELIN. "Can't you see that line drawn above her eyebrows, and how she shuts her rosy lips tightly over her teeth. Why, she is just full of bad thoughts."

"Perhaps the sun hurts her eyes," said the kind Prince, who could not bear to think a little girl could be bad; "and these mortal children often have to hide their teeth, they spoil them so, eating hot bread and sugar candy."

But the beautiful child turned her head just then and said, in a loud whisper, to a small lady behind her, "I think it's awful mean that I've had to walk with LETTIE. She's brown and homely, and her dress isn't nice at all—just white drilling, or something else, coarse and common."

"Oh, that don't matter!" whispered sweet ELLA, "I'll change places with you if you like, for I love LETTIE best of all the girls." So the sunny-faced child slipped into the little scowler's place, and caught hold of LETTIE'S hand with such a glad look that her tears went away like dew before the sun; for LETTIE, you must know, could not help hearing every word.

"Where can SWEET-TEMPER be," sighed GETTELIN; "for it needs a great shower from her silver bowl to soften that pretty child's angry heart."

"Never mind," said the Prince. "Let us see if LETTIE and ELLA cannot do it of themselves, without the help of fairies."

Ah, how the sun shone that golden day! and what flowery sweetness the light wind breathed across the white ranks and the blue ranks. Yet it was a little tiresome—all that marching and countermarching, though the bugles played sweetly, and the rich drum-music beat like waves against a beach of shells.

"Oh, dear!" murmured ALTA, "I'm so warm, and tired, and hungry—what shall I do?"

LETTIE heard the complaint, and put her hand in her pocket where was a great, golden peach that her teacher had given her before the marching had begun. Poor LETTIE did not often get peaches, and she loved them dearly; but a great drop out of the fairy's cup had fallen on her, or something in her own heart kept her glad and good; so she dropped her fruit into ALTA'S hand with such a pleasant smile that that tired child caught her breath with wonder.

"What made her do that?" whispered ALTA; "I wouldn't have given away all the peach I had. Oh, how good this is! It makes me feel better right off."

"Halt!" cried a strong man at the head of the ranks, and halt they did, right by a row of long tables being laden with good bread and meat, fresh apples, white cakes and wonderful tarts, that looked as if they were longing to be eaten. Then such pitchers of lemonade! ALTA found waiting very hard work, and almost burst into tears as she saw ELLA and LETTIE led into the last places at the only table that was quite ready. Looking back, LETTIE saw her, and left her seat.

"You are more tired than I," said the dear child; "I will take your place, and do you take mine." So in half a minute ALTA was refreshed by a goblet of cool lemonade, and began her dinner cheerily enough. It so happened that there was some delay in arranging the next table, so that LETTIE stood some time in the warm sun waiting; and not being a very strong child she suddenly grew pale and weak, and presently sank down in a faint, pale as a water-lily, for all her brown skin.

ALTA saw her friend fall, and all through her selfish little heart there rushed a great flood of shame. She leaped to her feet, and running, took LETTIE in her arms. "O she will die! she is dead!" cried the sobbing child. "Do speak, LETTIE, once more, and say you forgive me. LETTIE, dear, dear LETTIE, come back to life again!"

I think a stone would almost have heard the prayer of little ALTA just then. Surely LETTIE heard it, and opened her eyes with a smile like such as angels wear. "Come to my place," said ALTA, "I'll carry you there myself;" and she would have done it if the sick girl had not been lifted up by the strong man and taken there.

It was some time before ALTA finished her dinner, for she darted in and out among the tables like a humming bird, in search of nice things for her friend; and though LETTIE did not eat all she brought, she took everything with a loving grace that showed how anxious she was to please her sorrowful little friend.

"Oh, dear!" sighed ALTA, as she went searching about the tables, "I'd give all the world for some peaches!"

"Would you, little girl?" said a tall man, who heard her. "Well, here are three great Rareripes that you may have for nothing;" and they were all on LETTIE'S plate in a moment.

Just then, while the faint rose color had begun to flit over LETTIE'S face, and the dewy light to sparkle in her great gray eyes, there came a sudden wind and swept all the beech boughs aside under which she sat, so that a golden flood of sunshine rolled across her. At her feet knelt ALTA, the tears yet dripping down her red cheeks, but a smile of joy and love curving her soft lips and showing all that daintiness of snow-white teeth and pretty dimple. With one rich peach poised in her left hand, her right lying upon ALTA'S golden curls, and a soft glory of love like a crown—nay more beautiful than any crown—upon her brow, so sat LETTIE.

"Like a fairy," said Prince FANFANERO, as he held the picture up for GETTELIN to look at.

"More beautiful than any fairy," said GETTELIN, with a raptured face, sweeping down to leave a tender kiss upon LETTIE'S forehead.

"Oh, I saw——" said ALTA, with a great wonder in her eyes; "I saw—— What could it have been?" But whatever it was, it was gone before she could speak, and LETTIE looked wonderingly over her shoulder. "Who kissed me?" she said; but she never found out.

"What do you think of this, mamma?" said Fairy GETTELIN, showing her precious photograph, that glittered as none ever glittered before.

"I think," said Mrs. BANDETTE, "that you have selected the prettiest instead of the best." But the Prince and her daughter only laughed, and flew away singing—

What shall we give the fairies' girl?
Flowers, and fruit, and honey to eat?
Satin robe, and glimmering pearl?
Or fairy love and kisses sweet?

This we give:—Her soul shall keep
The brown face blooming and bright as day;
Fairy music shall charm her sleep,
And fairies love her forever and aye!

MEMORIES.

INTO an inner room I've looked to-day,
And found strange relics hidden away;
Relics which none but I could prize,
Hidden away from mortal eyes.

A scrap of a song—a breath of prayer;
A sound of music on the still night air;
The memory of an hour of bliss,
Of a circling arm, and a lover's kiss.

A broken promise—numberless sighs;
A look—was it loving?—from out blue eyes;
The rustle of leaves by soft winds stirred,
The clasp of a hand and a whispered word.

A tap on the door—a face on the wall,
The gleam of a light, and a darkened hall;
There were fragments of friendships—severed
An age of pain and a baby's cries. [lies;

The thrill that ran through the mother-breast,
When first to its fountain warm lips were pressed;
Half-sentences lisped by a voice so sweet,
And the patter, patter of little feet.

The joy in the first-born—exquisite pain
Of giving him back to Heaven again,
A mother's love and a father's pride,
With anguish at parting lay side by side.

Oh folded memories! lie away
Until the dawn of the perfect day
When changed shall be these bodies of clay,
And GOD shall wipe all tears away.

M. S. G.

WOMEN ADMITTED TO CORNELL UNIVERSITY.

THE Trustees of Cornell University, at their late meeting in Albany, unanimously resolved to admit women to all the privileges and honors of the University, on the same terms as men.

The question was very carefully examined by a very intelligent Committee of the Board, at the head of which was Mr. WHITE, the President of the University, who visited the most prominent institutions of learning where the sexes are educated together, and also several of our best female seminaries. After a careful analysis of the evidence accumulated, and a free consultation with many of the most experienced educators in America, they came to the unanimous conclusion that the education of the two sexes in common would lead to the elevation of both. When young men are educated by themselves, it tends to produce coarseness of manners and slovenliness of habits, which could not exist in the presence of refined and cultivated women. On the other hand, when girls are educated wholly among their own sex they are superficial in their studies, and do not acquire a thorough intellectual grip of their subjects; but their pride will not permit them to come to a recitation in the presence of young men without a thorough preparation and a complete mastery of their lessons.

Mr. HENRY W. SAGE of Brooklyn has generously contributed a quarter of a million of dollars to endow the female department, which is also to include a botanic garden, and an arboretum, which will include at least one species of every genus known to botanists. This will be of great importance to the agricultural college, and greatly facilitate the progress of its students.

The plan of the building for the ladies is not quite determined, but it will probably consist of a series of neat cottages arranged around a large quadrangle, which will be laid out in lawns and flower gardens, and embellished with shrubbery. By this arrangement the young ladies will be enabled to distribute themselves in families, according to their elective affinities, and avoid the society of those that may be repulsive to them; and if anything occurs to make one house disagreeable, they have a wide range of choice in the selection of another.

When the McGraw building is completed, the south college building will be wholly surrendered to the Agricultural college, as its permanent home, where all its museums and collections of every kind can be assembled, and where all its lectures and recitations will be held. The students in this college are increasing, and sixty acres will be devoted during the present year to an experimental and model farm, where all the practical exercises of the farm will be conducted under the direction of the Professor of Agriculture. There is every indication that this college will soon meet all the expectations of its most ardent friends, and be a source of instruction and profit to all the farmers of the State.

When the female department is completed, it is proposed to connect with it a model dairy, to be managed, in all its departments, by students; and it is hoped that poor girls, who desire an education, may in this way be enabled to maintain themselves during their entire course; and at the same time contribute largely to the increase of dairy science by the exactness of its processes and the accuracy of its records. Every case of difficulty will be minutely examined by the professors, until the cause is ascertained and a remedy provided.—C.

News of the Week.

GENERAL REVIEW.

THE Alabama Claims discussion continues on both sides of the Atlantic. It appears to be admitted that England will withdraw from arbitration if the American claims are maintained. The American "case" was received in England in December. The London Times had a faint hope, on the 20th, that the American Cabinet would yield to public opinion. The Alabama claims will keep....There has been a great sensation in Congress over what is called the French arms fraud, called up by Senator Sumner. On the 20th Senator Schurz made a great speech, which attracted much attention, and sustained Mr. Sumner....The citizens of New York have held a meeting in favor of the charter submitted to the Legislature by the Committee of Seventy....The management of the Pacific Railroad has been denounced. The blockade is broken. It is still asserted that a secret treaty has been concluded between England and Canada, granting independence to that colony.... There is much excitement in France over a Bonapartist conspiracy....Many State Conventions have endorsed President Grant.

without suffering. ELASTIC TRUSSES are superseding all others. Before buying Metal Trusses or Supporters, send for a descriptive circular to the ELASTIC TRUSS CO., No. 683 Broadway, New York.

No Fears need be entertained as to the results, if you use the *White Pine Compound* for your Cough, Weak Lungs or Kidney Troubles. It is certain cure in almost every case.

The Happiest Effect in Coughs, Pulmonary Complaints and Kidney Troubles can be secured by using *White Pine Compound*. There is no better or safer remedy before the public.

THE MARKETS.

MONEY AND TRADE AFFAIRS.

NEW YORK, Saturday, February 24, 1872.

THE Trade of the week has been active, although interrupted by the holiday of Thursday, Washington's Birthday. The importations are on a very large scale, and the prospects of the Dry Goods business through the spring months, as well for Domestic as Foreign Goods, are regarded as encouraging. In General Merchandise there is a good trade going on. There is some suspense felt by the Importers of Tea and Coffee on account of the action of the House of Representatives, on Monday last, in repealing the duties, but the Bill has gone to the Senate where it will meet less favor, or, at all events, less haste.

The last mail from Europe brought the most unfavorable letters from London to the Bankers here, in regard to the Washington Treaty excitement in England, but these advices are qualified by much later cable dispatches, although it cannot be said that the excitement is wholly allayed, or its effects upon financial affairs wholly spent. The feeling in Gold and Exchange is stronger in consequence of the unsettled political question between this country and Great Britain and the check which its somewhat violent discussion by the London press and in Parliament has given to new American enterprises dependent on European capital.

Money keeps steady at 7 ₰ cent. The Bank movement is not favorable to continued ease, but there is so much private capital in Wall Street that the rates are kept within 7 per cent. for the present.

The following are the comparative movements of the City Banks for the past fortnight:

	Feb. 10.	Feb. 17.
Capital	$87,155,500	$87,155,500
Loans	285,422,200	281,911,500
Gold and Greenbacks	67,888,400	65,269,700
Deposits	221,019,500	217,307,200
Circulation	28,161,700	28,149,200

PRICE OF STOCKS AND BONDS.

American Gold	110¾	N. Y. Central Scrip	92¾
U. S. 6-20's of 1867	111¾	Reading	113½
U. S. 6s of 1881	115¾	Rock Island	111
U. S. 10-40s, 5 ₰ cts	111	N. West	74¼
U. S. New Loan	109	Do. Preferred	91
N. Y. Bounty Loan	106¾	St. Paul	56
Tennessees	67	Do. Preferred	77
Virginias, new	57	Lake Shore	91
Missouri Bonds	95	Ohio and Mississippi	44
U. S. Currency 6s	114¾	Toledo & Wabash	76
Central Pacifics	102¼	Erie	30¾
Union do	91	Union Pacific Stock	34¾
Western Telegraph	69	Adams Express	*91
Pacific Mail	57½	American Express	65½
N. Y. Central Stock	97½	United States Exp's	66½

* Ex. Dividend.

The advance in Gold since our last report is ¾ per cent. In the Government Stocks the changes are slight. In the Railroads the chief fluctuation is in Union Pacific, which sold up to 38¾ and down to 34; starting the week at about 33 per cent. The Express Stocks are 2@3 per cent. better. The Telegraph and Pacific Mail Stocks are comparatively lame.

PRODUCE AND PROVISIONS.

NEW YORK, Friday, Feb. 23, 1872.

Beans and Peas.—The market has been well supplied with narrow fits, and prices are easier. Mediums have been worked off easily to the jobbing trade, at firm prices. Green peas are in moderate supply, and firmly held. The quotations are for prime medium, $2.50@2.55; good do., $2.30@2.40; fair, do., $2.10@2.20; peas at $2.60@2.70; kidneys, $3.10@3.25; red kidney, $2.10@2.25; prime marrowfats, $2.30@3.00; common do., $2.25@2.10. Canada peas, free in barrels, $1.30. Green peas, $1.50@2. Southern blackeyed, ₰ two bushel bag, $2.00@2.05.

Beeswax.—The market is moderately supplied, and late prices are supported. Sales of Southern at 35c.

Broom Corn.—Trade is unimportant. We append nominal prices:—New hurl, 8@9c.; new green, 6@6c.; new red, 5@6c.; old, 3@6c.

Butter. The market continues quiet, and prices for table and market grades are quoting all they will bear, latterly the probability of a late new make has infused a little strength in prices for real useful stock, but with that improvement comes the realization of plenty of butter still to come forward. Some of our most important receivers are in receipt of good round consignments from points that recently were thought to be about wound up. If this is to be the general case nothing but a long season will save our stock of medium grades. Common and low grade butter, for a novelty, shows considerable firmness, in some instances improvement. This class now shows that the steady drain upon it has reduced stock favorably for sellers. Fine butter is scarce, but sells only in small quantities at the extreme figure, 35c. Late receipts of Welsh are of irregular qualities.

State dairies, fine, 30@31c.; State dairies, fair to good, 26@29c; State, half-tubs, good to fine, 32@33c.; State, do., common to fair, 24@28c.; State, firkins, fine yellow, 28@30c.; State Welsh, good dairies, 28@31c.; State do., common to fair, 22@27c.; State do., fresh made, 32@34c.; State, fancy select tubs, 34@35c.; Ohio, good, 18@20c.; Ohio, Central and Southern, 14@17c.; Western, choice yellow, 20@21c.; Western, store-packed, 9@11c.; rolls, good West., 18@20c.; rolls, common to fair, 13@16c.; grease butter, 9@9¼c.

Cheese. There has been a less confident feeling, but no important changes in prices. The demand is checked by the high prices. Holders feel secure on the best grades, as it is claimed the stock of this description can be handled to meet ordinary wants of the home trade; but for low and medium stock our export demand is needed to clear the market. The exports for the past week were 71,417 lbs. The quotations are for State factory, fine, 16¼@16¾c.; fair to good do., 15@16c.; do. common, 12@14c.; State farm dairy, good, 14@15c.; do. common, 9@12c.; Vermont factory, good, 15@16c.; Ohio factory good to fine, 14½@15¾c.; English dairy good, 13@15c. Pine-apple at 16@18c. for State and 19@20c. for Connecticut.

Cotton.—Large numbers were here from the South a day or two since which put prices up to 22¾c. for low middling, but at the close there is a weak feeling. There is a fair amount of stock offering with a slow trade.

	Uplands.	Alabama.	N. Orleans.	Texas.
Ordinary	20¾	20¾	20¾	20¾
Good Ordinary	21¾	21¾	22	22¼
Low Middling	22½	22⅝	22⅞	23¼
Middling	23¼	23¼	23½	23⅝
Good Middling	23½	24	24¼	24½

Latest sales are at 22¾c. for Feb.; 22¾c. for March; 23¼c. for April; 23½c. for May; 23⅝c. for June, on a basis of low middling.

Dried Fruits.—The market throughout remains without life. A few lots of apples have been taken by the home trade. Holders claim late prices, but they must be considered entirely nominal.

Apples—Old State, qrs., 7@8c.; Western, new, 8@8¼c.; Southern, new, qrs., 7@8c.; do. fine, sliced, 9½@11½c.; new State qrs., 9@9¾c.; do. sliced fine, 11@13c. Peaches, peeled, new N. C., 17@18¼c.; do., do., do., 15@16¼c.; do. E. Sh. Va., 15@16¼c.; new unpeeled halves, 7¼@8c.; do. quarters, 5¼@6c. Plums, 25@27c. Cherries, new, ₰ lb, 25@30c. Blackberries, 13@13¾c. Raspberries, 26@29c.

Eggs.—Prices steadily advancing. Arrivals small for the season, and the demand brisk. Sales at 35c. for Western; 36c. for State; 37@38c. for Pennsylvania, New Jersey and Long Island; 34 for Southern.

Flax.—A few lots of fresh stock are offering. The demand is very light. North River prime, $17@18; do. fair to good, $15@16; Canada prime, $15; do. fair to good, $16. Tow, 2¾@3c.; spinning tow, 8@10c.

Fresh Fruits.—Choice Greening and Baldwin apples are worked off easily at full prices. A few Russets have been opened at $4@4.25; common stock is hard to sell at irregular figures. The demand is, in part, turned to West India fresh, which are plenty and cheap. Cranberries are selling slowly, and inside prices are often not accepted. Peanuts are firm, with a good trade.

Apples, good, bbl. $4@4.25; do. selections, $4.50@4.75; do. poor, $2.75@3; cranberries, fine, bbl., $9; do. common to fair, $6@7.50; do. crates, fine, $3@3.25; do. do. common, $2@2.50; oranges, La., bbl., $14@15; peanuts, Wilmington, bush., $2@2.20; Virginia, new, $2@2.20; do. common, $1.25@1.50; hickory nuts, $1.75@2; Pecan nuts, ₰ 3@3½c.

Flour.—The market has been steadily advancing; the high grades show an improvement of 15c. per bbl.; low and medium qualities, $5.10. The European market offers more encouragement to shippers. The arrivals are unusually light for the season, and the stock is steadily decreasing at $6.10@6.50 for superfine State; $6.80@7.00 for common extra do.; $7.05@7.15 for good to choice do.; $7.20@7.50 for fancy do.; $6.10@6.50 for superfine Michigan, Indiana, Ohio, Iowa, &c.; $6.80@7 for extra do.; $6.75@7.00 for choice extra do., including shipping brands of round hoop Ohio at $6.35@7.10, and trade brands of do. at $7.15@7.65; good to choice white wheat extras at $7.00@7.85; Minnesota, fair to very choice extra, at $7.50@8.00; St. Louis at $7.00@7.50 for common to fair extra, and $7.75@9.50 for good to choice. Southern at $7.00@7.75 for extras and $7.80@9.50 for good to choice. Rye at $4.10@5.15 for common to fine. Buckwheat flour at $3@3.00.

Grain.—For wheat prices advanced about 2c. per bushel early in the week with a few parcels taken by shippers, but at the close there is a weak feeling on account of the advance in ocean freights, business being brought to a stand. The quotations are $1.58@1.59 for No. 2 spring in store, $1.59@1.61 for No. 1 spring in store, $1.66@1.68 for winter red Western, $1.70@1.73 for amber Western, $1.73@1.80 for white Western. Rye is dull at 72@73c. for Western. Barley is offered at prices more in the buyer's favor; sales of two-rowed State at 89c., Western at 90c. Corn is lower, with large supplies and decreased trade; sales at 71@72c. for new Western mixed afloat, 72@72½c. for yellow and 71@72c. for white Western. Oats are lower; sales at 51½@54c. for Western in store and afloat, and 55@56c. for white Ohio.

Hay and Straw.—Prices of hay have been advanced 5c., with decreased arrivals. Shipping hay at $1.25@1.30; retail qualities, $1.35@1.65; salt hay, 60@70c.; clover, 60@80c. Long rye straw $1.05@1.10; short rye, 80@85c.; oat, 65@80c.; wheat, 60@70c.

Honey.—Supplies light and prices firm. Sales of white clover at 22@25c.

Hops.—Trade shows no improvement; the light stock of suitable grades creates a firm feeling on these descriptions. Common and medium grades are rather in the buyer's favor.

New York, growth 1871, 25@65c.; Eastern do, 1871, 25@60c.; Western do. 1871, 25@60c.; yearlings do. 1870, 10@30c.; olds do. 1869, 10@15c.; old olds do. 1868, 8@12c.; Californians do. 1870, 15@30c.; Californians do. 1869, 8@15c.; Bavarians, 75c.; English, 65c.; Belgians (nominal), 55c.

Poultry and Game.—The weather for several days during the week has been warm, and buyers of dressed stock have been cautious in taking more than they could readily place. This, with the decreased trade attending Lent, has allowed even the light receipts to give us some accumulation, and the market is easier, particularly for Western. Prices seldom reach the outside figures. Large turkeys are not wanted. At the close the weather is more winter like, but we do not advise free shipments. Live has declined.

Turkeys, Western, good, 16@18c.; do. poor and frozen, 12@15c.; do. State, 17@18c.; do. Jersey, 20@21c.; Ducks, Western, 15@19c.; do. poor and frozen, 12@16c.; do. State and Jersey, 16@18c.; Geese, Western, 11@12c.; do. poor and frozen, 10@12c.; do. State and Jersey, 14@16c.; Fowls and Chickens—Western good, 15@17c.; do. poor and frozen, 12@14c.; do. State, 15@18c.; do. Bucks Co. and N. J., 18@20c.; capons, 25@28c. Fowls and chickens Live, State and N. J., 16@17c. do. Western, 14@15c; roosters, 10c.; ducks, per pair, 75c@$1.50. Geese.—Western, $1.50@1.75; do. Canada, $1.75@2; do. Jersey $3@3.50; turkeys, 16@17c.

GAME.—Most items are now devoid of a wholesale quotable interest. The Sportsmens' Club threaten to exercise the utmost severity in carrying out the law on the first, and every dealer is scattering his surplus irrespective of prices, in order to close it out. Fine rabbits from the far West are quite salable. Wild ducks are in fair demand. Quail, sound, per dozen, $2.00@2.25; do. soft, $1.75@2; Grouse, ₰ pair, 75@90c.; Partridges, Eastern, 75@80c.; do. State and Western, 100@1.25. Rabbits, 10@50c. Hares, 50@40c. Venison, whole, ₰ lb., 8@10c.; do., long saddle, 10@12c.; do. short saddle, 12@13c.; do. Minn., 14@15c. Buffalo, hind saddles, 3@5c.

Provisions.—Mess Pork has ruled dull most of the week, and prices are not materially changed from our last for cash, old or new. Speculative lots have not fluctuated much compared with present quotations, and there is little disposition manifested to open forward business. We quote, cash, old $13 37; do. new $11.25; March quoted $14.20; summer months, $14.50 nominally. Beef without movement beyond a fair demand ₰ bbl.; new plain mess, bbls, $8@11; extra mess, do., $10@12; prime mess, tcs., $15@18; India, do., $18@20.

Beef hams are scarce and tending higher, ranging 22@26c. for Western and 28@30c. for Texas lots. Bacon is in good demand and firm at 6@7¼c. for Cumberland and short rib, 7¾@7¾c. for long clear; the extreme price is for city. Cutmeats nominal at quotations. Lent restricts the demand from store. City smoked shoulders, 6@6½c.; pickled bellies, boxed, 7½@8c.; do. loose, 7@7¼c.; pickled hams, 8½@9¾c.; pickled shoulders, 5@5½c.; shoulders in dry salt, boxed, 5½@5¾c.; do. loose, 5¼c.; fresh hams, 8½@9c.

Lard has sold as liberally as the moderate spot offerings would admit of and prices are very steady at 9½c. for prime Western steam, and 9¾c. for city steam and kettle. Tallow is weak at a shade under 9¼c.; stearine nominal at 9¼c. for choice tes. Western dressed hogs have sold freely to the packing trade at 5¾@5¾c., closing dull.

Seeds.—Clover is again lower, with large supplies, and not much inquiry from shippers. Sales at 10¼@9¾c. for Ohio, and 10@10¾c. for prime Indiana and Michigan. Timothy is quiet. Small sales at $3.62½.

Tobacco.—Kentucky leaf begins to come forward freely, and there are more anxious sellers of the old crop, although no changes in prices are offered. The outlet is very light; shippers closing out urgent orders only. Seedleaf is selling slowly, with prices generally unchanged. Foreign is quiet and entirely nominal.

Vegetables.—The shipping trade in potatoes is less liberal; no changes are reported in prices. There is an increased supply from New Jersey, of bag lots and the home trade are working mainly on this stock.

Potatoes, Early Rose, bbl., $2.12@2.37; Pr. Blows, $1.75@2; Prince Albert, $1.75@2; Monitor and Goodrich, $1.25@1.50; Jackson, $1.25@1.50; Dyright, $1.25@1.75; Nova Scotia, $1.75; sweet Del., $3.75@4.00. Onions, red & yellow, $1.50; white, $2.50@3; Conn., 100 strings, $2.50@3. Garlic, per 100 bunches, $20@22. Turnips, Russia, bbl., $1.25; flat, $1@1.25. Cabbages, per 100, $5@7. Hubbard squash, per bbl., $4; marrow, $4. Beets per 100, $1.25. Carrots per 100, $1.50.

Wool.—The business in fleeces has been moderate The stocks now are so light that holders are very cautious, and refuse to sell under $82½@85c. There are a number of parties here who need stock, but they bid, as a rule, something under the quoted figures. The late free business in pulled has brought the stock down to a low point. Buyers are willing to pay late prices promptly, but they find few sellers, unless at an advance. California and Texas grades in light demand. Foreign meet with considerable attention at full prices. Latest sales are of fleeces at 80c. for X Michigan and Ohio; 60@62c. for medium unwashed; 55@87½c. for super and extra pulled; Texas at 33@51c.; Oregon at 61c.; full clip California, 36@40c.; Mexican at 33@36c.; low rolls, 57½c.; fine English rolls, 70c.; Mestiza, 37½@40c.; Cape, 47½c.; Australian, 65c.; East India, 60@65c., unwashed at 55c.; Smyrna, 30c.; Persian, 31c.; unwashed foreign, 52½c.; washed do. at 75c.

Whisky.—Western is dull and weak, at 91½c.

COUNTRY CHEESE MARKETS.

Little Falls, N. Y., Feb. 24, 1872.

THE market at Little Falls, for the week ending Feb. 24, is very firm, and farmers who have small lots of late made, appear anxious to realize full values for them. One farmer, holding about 1,000 pounds of this character of cheese, refused 15c. during the early part of the week. This price would leave but a narrow margin to the dealer, after paying freights and commissions to the city. Farm dairies, good early winter make, may be quoted at 14@15c.

We hear of no transactions in factories. Those that have small lots are holding at prices above the views of buyers. We hear of 16c. being offered in some instances and refused by the holders. Factories may be quoted at 15@15c., and the latter figure is considered top price, though possibly something extra fine might bring a shade more. Butter comes in sparingly, and extra is taken for home trade at 25c.

The weather is mild and pleasant. Cows are wintering pretty well, but some herds are badly affected with abortion.

ROCHESTER, N. Y., Feb. 22.—Wheat market 5c. higher; red winter, $1.50@1.55; white, $1.55@1.70. Corn in demand at 70@73c. Oats selling at 45@47c. Barley, 65@70c., two-rowed; 75@80c., four-rowed. Dressed hogs selling at $6.50@6.75; beef, $5@8; mutton, 6@8c. ₱ lb.; chickens, 16@17c.; butter, 23@25c. Eggs dull at 28@30c. Wool quoted at 60@70c. Sheep skins, $2.30@4 each. Potatoes, 45@55c. per bushel. Turnips, 40@50c. Apples, $1@1.25; dried do., 8c. Clover seed, $6@6.25. Timothy, $3.25@3.75. Hay, $16@24 per ton.

LIVE STOCK MARKETS.

NEW YORK, Feb. 23, 1872.

THE tendency of the market for the week has been unfavorable to the selling interest. The supply has been greater than the demand, and prices are lower for all descriptions. The experience of late years favored the idea that the lighter receipts during the Lenten season would more than balance the lessened demand, and that the lucky or shrewd operator who should own the most of the stock sent forward would gain correspondingly by the advance in prices; but, as an ex-Prime Minister of England remarked in one of his speeches, "It is always the unexpected that happens;" and instead of lighter arrivals the receipts have increased; so that while prices have been advanced a fraction in the West, through the strong competition for stock in moderately supplied markets, there has been a marked decline here.

TOTALS LIVE STOCK FOR THE WEEK.

	Beeves.	Milch Cows.	Calves.	Sheep.	Hogs.
This week	7,183	130	816	28,402	35,397
Last week	7,328	191	777	27,501	20,230
Correspond'g w'k '71.	7,851	57	741	28,518	9,947
Average, '71	7,187	88	2,381	25,132	25,177

Beeves.—Trade has been dull on each market day throughout the week. Buyers demanded concessions, and sellers wanted an advance. The quality of the offerings was averagely fair, and some of the best bullocks intended for show cattle were really fine. For last Monday's market the supply reached 4,401 head—2,413 at Communipaw, 1,267 at 90th street, and 621 at Weehawken. The market opened with a dull feeling, but the early sales were at unchanged prices, and only toward the close were the sellers willing to yield, when the market broke down, and the latest sales were at a decline of ½@¾c. ₱ lb. Since Monday the actual receipts have been only 62 cars, or 1,982 beeves; but 50 cars more were overdue. With a material reduction in prices a number of beeves have been sold, but nearly one-half remain in the yard, and it is doubtful if all the droves can be closed out to-night. The extreme range of prices on Monday was 8½@13¾c. ₱ lb—the former figure for fat bulls and dry cows, and the latter for perhaps a half dozen show cattle; but 10@12c. is a good quotation to-day for common to prime native steers. Some of the latest sales were: 280 Illinois steers, 6½@7½ cwt. at 10½@11¾c. ₱ lb; 63 do., 6¾@7 cwt. at 11¼c.; 48 do., 6¾ cwt. at 11c.; 11 do., 7⅛ cwt. at 11¾c.; 21 do., 7¼ cwt. at 11¼c.; and 36 Ohio steers, 7 cwt. at 11¼c.

The following are the prices at the close of the market:

	This week. Cents.		Last week. Cents.
Choice bullocks, ₱ lb	12	@ 12¼	12¾ @ 13
Good to prime	11	@ 11½	11½ @ 12
Medium	10¾	@ 10¾	11 @ 11½
Ordinary	9	@ 10	9½ @ 10½
Poorest grade	8	@ 8½	8 @ 9
Average of all sides	11	@ —	11¼ @ —

Milch Cows.—The 130 received during the week include a car load not offered here, but enough remained to carry down prices about $5 per head, and the market ruled weak, at $20@30 for common to choice. A lot of 18 averaged $55.25 per head, and another car load $42.75. The trade in cows at this point is confined to the market place at the foot of West Forty-eighth street.

Veal Calves.—The receipts have not materially increased, but the demand is not so strong, and prices are lower—about ½c. ₱ lb. on live calves and not far from 1c. ₱ lb. on dressed. Fair to best Hucks county and State veal calves are selling at 9½@10½c. ₱ lb.; ordinary hog-dressed at 7@8c.; fair at 9@10c., and good to fine at 11@12c.

Sheep and Lambs.—Mutton is decidedly weak, and has but a slow sale at reduced figures; but wool continues firm, with an advancing tendency, and sheep must, therefore, be sold at good prices, unless forced upon an overstocked market. The arrivals for the week were not excessive, and a few fair loads were sold Monday and Tuesday at fair prices; but since then buyers could not be induced to operate at any figure, and the market to-day is flat and prices nominal. Some forced sales were, 2 cars Ohio sheep, 76 lbs. average, at 6¾c.; 4 cars Canada, 105 lbs, 7¾c.; 1 car do., part bucks, 101 lbs, 6¾c.

Hogs.—Trade in live hogs limited, and the downward tendency has discouraged shipments to commission salesmen. Latest transactions in live hogs were, 6 cars mixed Western, 137 lbs, 7½c. There has been a large trade in dressed hogs, and the market closes steady at 5¾@5¾c. for Western, and 6¾@6¾c. for city.

TO FARMERS. DOUBLE REFINED POUDRETTE of the "LODI MANUFACTURING CO." for sale in lots to suit customers. This article is sold for *half the price* of other fertilizers, and is cheaper for tobacco, cotton, corn and vegetables than any other in market. It is made entirely from the night soil, offal, &c., of New York city. Price, delivered on board in New York city, Twenty-five Dollars per ton. I ask attention to the following Testimonials:

ONEIDA CO., N. Y., Oct. 13th, 1871.—*Dear Sir:* For two years past I have used the Double Refined Poudrette for corn, potatoes and garden Vegetables, and I have realized on the first crop 100 per cent. for all the money invested. Yours truly, T. B. ALLANSON.

WINDHAM CO., Vt., Dec. 4th, 1871. *Dear Sir:* I think the Lodi Company's Double Refined Poudrette the best manure I can find for tobacco, corn and potatoes. I shall order a number of tons another season. Yours respectfully, E. S. HOUGTON.

JESSE VAUGHN of Lancaster, N. Y., under date of September 20th, says:—I applied the Double Refined Poudrette, last Spring, on corn and potatoes, and I believe I have the best corn in town, and my potatoes are an excellent crop. I have used your Double Refined Poudrette several times before, and always with good results, but this year the effect has been more perceptible than ever before.

A pamphlet giving full directions, &c., sent on application to JAMES T. FOSTER, 66 Cortlandt St., N. Y.
☞ For sale by C. G. STARKWEATHER & SON, Rochester, N. Y.

WEBSTER'S PATENT
BUTTON-HOLE WORKER.
Patented June 27, 1871.
One of the most important inventions of the age!
The most perfect Button-Hole Worker ever invented!
So simple that a child can work a more perfect button-hole with it than the most experienced hand can work without it. Every stitch is taken with the most perfect mechanical accuracy. Is used entirely independent of the sewing machine, and will last a life-time. Does away with pricking the fingers, straining the eyes, and with imperfect and irregular worked button-holes. They give universal satisfaction. Ladies who use them say that they are worth their weight in gold. Over 11,000 sold during the first week of their introduction. The most liberal inducements offered to the trade. Dry Goods and Fancy Goods Merchants find it an excellent selling article. Local and traveling agents wanted everywhere.

Samples and terms, with full directions for use, sent prepaid on receipt of 50 cents. Orders by mail receive prompt attention. Address

ISSUE LIMITED TO $16,300 PER MILE.
In Denominations of $1,000, $500 and $100.
OF THE
Logansport, Crawfordsville and Southwestern Railway, of Indiana.
Price 95 and Accrued Interest.
This Road, 92 miles in length, 70 of which are in actual operation, runs southwesterly from Logansport to Rockville, passing centrally through five of the wealthiest and most productive counties of Indiana, hitherto without railway facilities, and penetrating for Twelve Miles at its Southern terminus the celebrated Block Coal Fields of Parke County, it affords the shortest existing outlet to Chicago, Toledo, Detroit, Fort Wayne, Logansport, and all other intermediate points for the Block Coal (now in such large demand), Lumber, Cattle, Grain, and other surplus products of this rich Agricultural and Mineral section of the State.
For the present we offer a limited number of these First Mortgage Bonds at 95 and Accrued Interest in Currency, or will exchange them for U. S. Bonds or other marketable securities at the rates of the day.
At the above price these Bonds yield to the investor 60 per cent. more income than the Bonds of the United States, and we unhesitatingly recommend them to all classes of investors as offering the most ample security and liberal returns.
Further and full particulars, with Pamphlets and Maps, furnished by us on personal or written application.

"FAMILY FAVORITE!"
THE
WEED. F WEED.
The most perfect, reliable and generally useful machine in existence. For the family of the farmer or mechanic, where the work required of a sewing machine ranges from the heaviest garments of men's wear to the most delicate and ornamental fabrics for ladies and children, it has proved itself thoroughly efficient and entirely satisfactory. Of unequaled simplicity and completeness of construction, capable of being learned and operated with one-fourth the usual expenditure of time and labor, with a capacity for quantity, quality and variety of execution beyond its competitors, and a reputation for durability and reliability known and appreciated by thousands, it is offered to the people for the most critical inspection and comparison, with confidence that its obvious merits cannot fail to convince the careful examiner of its superiority. Manufactured by the
WEED SEWING MACHINE CO.,
HARTFORD, CONN.

GARDNER'S PORTABLE

BOOK-RACK, BOOK-CASE, AND WRITING DESK COMBINED.

This is the first good article of furniture that has ever been made, which can be taken apart in less than a minute and packed away or shipped from place to place all easily as a few short boards, and can be set up again by any person in a few moments without the aid of any tools. Small sizes form a substantial and complete Book-Rack. Larger sizes form a substantial Writing-Desk and Book-Case Combined.

Prices for large sizes, 6 feet 4 inches high, solid Black Walnut, from $10 to $22. Prices for smaller sizes down as low as $1. Also, Portable Wardrobes, prices $10 to $20.

A liberal discount to the trade. Ten per cent. off to all preachers.

The First Premium was Awarded

on our Book-Racks and Writing-Desks at the

Great Fair of the American Institute

NEW YORK, 1870.

Our goods can be found at the Furniture Dealers and Bookstores generally throughout the country.

ANDERSON'S AGRICULTURAL STEAMER, for *Steaming* FEED FOR STOCK: Heating Cheese Vats; Tannery Vats, Conservatories, &c. This Steamer is made of Wrought Iron, thoroughly riveted and finished in good style. It has a reliable Automatic or Self-regulating Water Feeder, Safety Valve, Vacuum Valve, Water Gauge Cocks, Whistle, &c., all complete. The boiler is peculiar in construction, being ONE COMPLETE DOUBLE BOILER WITHIN ANOTHER, the two communicating one with the other. It has an extraordinary amount of fire space for the size of the boiler; No. 3, a medium size, having 3,853 square inches of fire surface; consequently, it requires but little fuel to run it. Either wood or coal may be used for fuel.

It will cook more feed, or heat more water, in a given time, than any other Steamer of the same size or cost. It is more durable than any other, for the reason that the firebox is made of wrought iron, and is *entirely surrounded with water*. We are also manufacturing:

Anderson's Low Pressure Steam Heater, for Heating *Private Dwellings*, *Stores*, *Churches*, *Conservatories*, &c. We manufacture for all the territory east of Illinois.

FARMERS, DAIRYMEN AND BUTTER BUYERS!

PACK YOUR BUTTER

IN

WESTCOTT'S RETURN BUTTER PAIL

Approved and recommended by the leading authorities of our country on dairying, and acknowledged by all butter dealers to be the very best package in use. Butter packed in this Pail brings **5 to 10 cents** more a pound in the New York City market than the same quality in any other package.

READ THIS:

NEW YORK, Nov. 15, 1871.

We, the undersigned, Produce Commission Merchants of the City of New York, consider Westcott's Return Butter Pail, manufactured by Silsby Bros., Belmont, N. Y., *the best package in the market*. It is our experience that Butter packed in this Pail *sells more readily and commands a higher price* in this market than in any other package, and we heartily recommend its general use by the dealers, dairymen and butter buyers who ship to this city.

Respectfully,

(Signed by 45 leading Commission Merchants.)

The Westcott Return Butter Pail meets my approval as a good butter package. It is one which I always feel safe in recommending.

X. A. WILLARD,
Dairy Editor Moore's Rural New-Yorker.

Dairymen, send for a Circular! Dealers, send for a Price List! We are the sole manufacturers of **Westcott's Return Butter Pail**, and also manufacture very extensively Butter Firkins, Half-Firkin Tubs, 25-pound Butter Pails, Well Buckets, &c., &c.

CARHART'S

PATENT TWO-HORSE

Pulverizing Cultivator

Was Awarded the First Premium at State and County Fairs in 1870 and '71.

It is superior to the best Wheel Cultivator.
The price is only Twenty Dollars.
The draft is reduced nearly one-half.
The depth you wish it to run is regulated without the use of wheels.
It can be drawn close to a tree or plant without injuring it.
It is not disturbed by short undulations of earth, like the Wheel Cultivator, but pulverizes, levels and fits the ground for the Mowing Machine better than any Cultivator in use, and can be used for more purposes than any other implement on the farm.

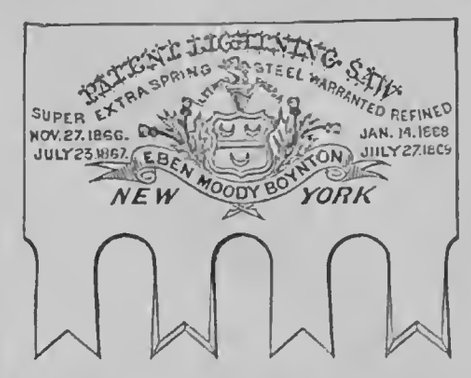
BOYNTON'S LIGHTNING SAWS

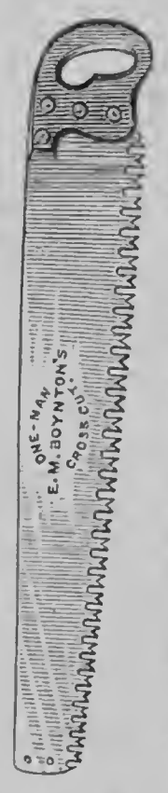
WILL COIL AND TOUCH



UNINJURED.

Not one in 20,000 has Failed.

The Lightning Saw, from the peculiar form of the teeth, acts both ways, going and returning, and as the teeth have an angle of 90°, they have a cutting edge instead of a scraping point, and plow a clean groove through the timber, which is much easier than to scrape one out.



E. M. Boynton's Lightning One-Man Cross-Cut, for Cutting Wood, Joist, Logs and Timber, and sawing down Trees. Complete, ready for use. Price, per foot, $1.25.

This Saw claims superiority over all others in respect to Speed, Ease, perfect Clearance, and the length, strength and durability of the teeth.

With this Saw any given amount of labor may be performed in one-half the time required in using any other saw. Millions of axes are used to do what these saws would do in one-half the time and half the number of men; and save all the fuel now wasted in chips. As an extreme test of the capacity of this saw, two men at Philadelphia, in presence of Maj.-Gen. Meade and others, cut through a twelve-inch Sycamore log in EIGHT SECONDS; and two other men in Michigan cut twenty-six cords of hard wood in EIGHT HOURS.

The following are from scores of Testimonials and Notices.

From J. W. BLAKE, Superintendent and Engineer American Institute Fair, Nov. 4th, 1871:

E. M. BOYNTON, *Sir*,—This certifies that I saw the Lightning Cross-Cut Saw, worked by hand, by two men, November 2d, at this Fair. Said men and saw cut off a sound 8x9 inch chestnut log in 5¾ seconds; and 16 cuts of same, *continuously*, in 2 minutes and 18 seconds, or at the rate of a cord of wood in less than nine minutes. I am satisfied that for all purposes of cross-cutting large and small timber, your cross-cuts and wood saws have no rival in speed, in ease, and in simplicity. I believe their universal use would save a vast amount of money and fuel, and lighten the toil of millions of men.

The Judges' Official Report, American Institute, October, 1871:

No. 1108. "LIGHTNING SAWS."
E. M. BOYNTON, No. 80 Beekman St., N. Y.:

The Lightning Saws are certainly an improvement in that useful article. Formerly the greatest angle for saw teeth in cross-cut saws was 60°, while in these saws it is 90°, which gives it a cutting edge, instead of a scraping edge, and must necessarily cut much faster than any other saws now in use, and consequently we consider them OF THE HIGHEST DEGREE OF MERIT.

From the Sing Sing Republican, Feb. 1st, 1872:

At the Bedford Farmers' Club, at Katonah, Jan. 26th, 1872, two men were appointed by the Club to test several cross-cut saws. They tried them all in green and hard wood, and reported in favor of BOYNTON'S LIGHTNING SAW, for easy motion and rapid cut. A leading farmer said he had used one this season, and that two men would saw more with it in one day than in three days with any other saw.

The Saws are of all sizes, from the fine hand-saw of one foot long, to the ten-foot California Cross-cut.

None are genuine unless they bear the name of E. M. BOYNTON, and the date of the four patents. Beware of worthless imitations.

A six-foot Cross-Cut and a Wood-Saw blade sent on the receipt of Six Dollars.

E. M. BOYNTON,

Sole Proprietor and Manufacturer,
80 Beekman St., New York.

Not to be Paid for until Tried.

LITERARY ITEMS.

THE leading publishers of New York have made contributions of books to Rev. Robert Collyer's library.

THE Chicago Pulpit, is the title of a weekly pamphlet, containing the best sermons preached in Chicago.

THE Official Gazette of the United States Patent Office, is a weekly publication, containing a list of all the new patents.

THERE is a controversy going on in England, over the origin of "Oliver Twist." Mr. Cruickshank defends Dr. Shelton Mackensie against the statements made by John Forster.

HJAIMAR HJORTH BOYESEN is a Norwegian about twenty-two years old, now a professor in a Swedenborgian college, Urbana, Ohio. His poem in the February Atlantic is original, and was written by him, in English.

HARPER'S, for February, opened with an interesting article on Walter Scott, followed by one on "Holland and the Hollanders," which was very readable. An article with quaint illustrations, was called "Old Books in New York." A large number of short romances, and the usual departments, filled the remaining pages.

THE London Athenæum, noticing American books for 1871, speaks highly of the following, as the most notable:—Taylor's translation of "Faust," Bryant's "Homer," Lowell's "Among my Books," Whipple's "Success and its Conditions," John Hay's "Castilian Days," Higginson's "Atlantic Essays," Mrs. Phelps' "Silent Partner," and the poems by Stoddard, Hartt and Wm. Winter.

Floricultural.

IMPROVED PANSIES.

It is only within the past few years that our gardeners have paid any attention to the cultivation of the best varieties of the Pansy. And even at the present time its cultivation is mainly confined to gardeners of foreign birth, who retain a love for the plants that they learned to admire in their youth. It is quite probable that our climate has had something to do with the seeming neglect of this beautiful plant, it being too dry and hot for the more perfect development of the Pansy in the open border. These unfavorable circumstances may, however, be easily remedied by the free use of water and giving the plants partial shade while in bloom.

That there is a growing taste and a corresponding increasing demand for choice varieties may be inferred from the large number of plants offered in our city markets during the early spring months. The size, form and increased brilliancy of the flowers are very marked in each succeeding season, all of which we take to be unmistakable signs of progress, and that our florists are endeavoring to show that the very best sorts of the fancy bedding Pansies can be grown in this country.

Gardeners who cultivate Pansies for market usually sow the seed in autumn, or early winter, and give them protection in frames during the cold weather, but it is not too late even now to sow the seeds for bedding-out plants next summer.

Situation for Seed Bed.—Select a situation for a seed bed that is sheltered from winds, also where the plants will be shaded during the middle of the day, but exposed to the sun in the morning. The soil should be light, rich and deep. Old, thoroughly decomposed barn-yard manure is the best for Pansies, although other kinds may be used instead.

Sowing the Seed.—Scatter the seed thinly over the surface; sift on just enough fine soil to cover it, and give a good watering; also apply water from time to time, as may be necessary to keep the surface moist, but not sufficient to destroy the young plants.

Transplanting.—When the plants are two or three inches in diameter, they may be transplanted to the border previously prepared for their reception, or they may be allowed to remain and bloom in the seed bed.

Selecting Specimens.—When the plants come into bloom, the very finest varieties should be selected for seed, and these taken up and planted by themselves, where they can be carefully tended and the seed saved when ripe. We have noticed that the best cultivators of choice Pansies never dispose of any extra fine variety that appears among the seedlings; but these are carefully removed to a frame, where, by careful cultivation and protection, a perfect development can be secured. By following up this system of selecting only a few of the very best sorts from which to raise seed, a marked improvement in all the seedlings will soon be observed. Even if all the varieties raised are excellent, there will always be a few more perfect than others, and it is only by selecting the very best as "stock plants" that a very high standard of excellence can be retained. When a very superior variety has been produced and it is desirable to preserve it for more than one season, recourse may be had to the usual modes of propagating by layers or cuttings. We give herewith illustration of four varieties of what are termed, by English gardeners, Fancy Bedding Pansies.

Standard of Excellence.—The standard of excellence for Pansies may be briefly given as follows:—There are three classes recognized—1, Selfs, all of one color; 2, having yellow, orange, sulphur or straw-colored ground, with margin of maroon, crimson, chocolate, bronze, puce and their intermediate tints; 3, having a white ground with margins of purple, blue, and their intermediate tints. The properties of the flowers in these classes are considered thus:—1, each bloom should be circular, flat, and very smooth at the edge; 2, the ground color of the three lower petals should be alike, whether it be of any of the three named above; 3, the two upper petals should be perfectly uniform, whether dark or light, fringed or blotched; 4, if the flowers are equal in other respects, the larger the better; but no flower can be considered first-class that is less than 1½ inches in diameter.

IMPROVED PANSIES.

Industrial Topics.

NATIONAL AGRICULTURAL CONVENTION,

At the Department of Agriculture, Washington, D. C., Feb. 15, 1872.

[Concluded from Page 146, last No.]

THE Third Day of the Convention was, like the first two, thoroughly occupied with the expression of ideas and plans of active minds. Mr. BARNARD of Georgia read a long, excellent, though wordy and tedious paper, to which was appended a resolution equally long and wordy, the substance of which was that "the Department of Agriculture will not have reached its full measure of usefulness until it shall not only act in active and practical concert with the several State Agricultural colleges, boards and societies, but also has proposed and established an international system of observations and interchange of information, by means of an organization of which it shall be a component part." The resolution was referred to a committee who were instructed to crack off the shell and get at the kernel.

Governor PATTON of Alabama, presented resolutions embodying a petition to the General Government to act upon the recommendations of Com. MAURY, favoring the calling of a Convention of the representatives of the different governments, with a view to establishing, by international co-operation, a general and systematic plan of meteorological observations and crop reports—the same as published in an editorial on this subject in the RURAL NEW-YORKER, Nov. 25, 1871. This resolution was adopted.

More Agricultural College Resolutions.

Senator JUSTIN F. MORRILL of Vermont, the father of the Agricultural College Endowment Bill of 1862, offered the following resolution, which was unanimously adopted:

Resolved, That, as the sense of this convention, we deem it of paramount interest to ask of Congress, as we do earnestly, for an additional donation of land, or proceeds of land, sufficient to found a professorship of some of the branches of practical science in each of the colleges now wholly, or in part, sustained by the previous land grant of Congress, and also that the War Department may be directed, at the earliest possible moment, to assign an officer of the army to each of said colleges, in every respect competent to give mathematical and other military instruction.

Agricultural Colleges Again.

Gen. HALSTED of New Jersey offered the following resolutions, which were adopted:

Resolved, That the agricultural societies and agricultural colleges of this country have the same great aims—the improvement of agriculture and the elevation of the agricultural classes—and should be knit together in the firmest friendship.

Resolved, That we heartily approve the admirable suggestion of our President, Hon GEO. W. LORING, that each State and county agricultural society shall provide one scholarship in the Agricultural Society as a living bond of union between the society and the College, and as a most effecting means of increasing the number of agricultural students in the country.

Resolved, That we recommend the agricultural colleges to procure the appointment, annually, of a committee of intelligent practical farmers, to assist in the examination of the agricultural classes in the colleges, and that no graduate of such colleges shall receive a diploma till he shall pass a satisfactory examination before such committee.

Entomology in the Department.

CHARLES V. RILEY of Missouri offered the following preamble and resolutions, which were adopted:

Whereas, The injuries caused by noxious insects to the different crops of the country are among the most serious drawbacks to successful agriculture, and all knowledge that will enable us to counteract the ravages of these pests of the farmer should be disseminated throughout the country; and

Whereas, It is known to the members of this Convention that Mr. Townsend Glover, Entomologist of the Department of Agriculture, has been for many years engaged in preparing expensive illustrations and other materials for a work on insects; and

Whereas, The labors of said officer are in great part lost to the country for want of sufficient means to publish this work; therefore,

Resolved, That this Convention earnestly ask of Congress an appropriation to the Department of Agriculture, to enable it to publish the work at once.

Resolved, That an annual appropriation of at least $10,000 be furthermore asked for the special purpose of causing experiments for the destruction of noxious insects, to be made by the different State boards throughout the country, whenever the Commissioner shall see fit to so instruct and direct said boards; the results of such experiments to be published in and disseminated through the monthly reports of the Department.

A Preliminary Report on Experimental Stations

was made, in which the importance of establishing experimental farms throughout the country was elaborately discussed, and the objects to be accomplished, the mode of research to be pursued, and the cost and useful results likely to be gained were ably though somewhat crudely, discussed. The Committee asked further time, which was granted, and R. F. JOHNSTONE of Michigan was instructed to prepare such further report, and the co-operation and assistance of the Department of Agriculture, in preparing, publishing and disseminating it, was asked.

Timber Preservation.

Prof. SWALLOW of Missouri offered the following resolution, which was adopted:

Resolved, That a committee of five be appointed to report to the Commissioner of Agriculture on the best methods of preserving the timber of the country, especially the timber of the Rocky Mountains and the central prairie regions of the Republic.

Military Education in Agricultural Colleges.

DR. GREGORY of Illinois presented a report upon Military Education in Agricultural Colleges, which contained the following plan:

1. Let Congress give to every State that shall comply with the prescribed conditions, $15,000 annually, to aid in the maintenance of a college of military science. The conditions of this grant to be, that any State accepting the grant shall furnish, as the military college, an institution—first, having a capacity for the instruction of —— students, and an actual attendance of —— male students; second, furnishing instruction in all branches of learning now provided at West Point, (military science to be included on receipt of grant;) third, having a parade ground ample for the evolutions of a battalion of infantry or a section of artillery, and a drill hall sufficient for the drill of a company; fourth, requiring all male students, unless excused for a just cause, to drill long enough to learn thoroughly the duties of the infantry soldier; and fifth, affording free military education to all students applying for same, under such restriction in regard to age and character, as may be required.

2. The $15,000 shall be used in paying the salary of a professor of military tactics, who shall teach whatever pertains to the organization, subsistence and management of armies in camp or field; a professor of military engineering, including ordnance, gunnery, &c.; an assistant professor, who shall be a competent drill-master and draughtsman; a band-master, who shall be competent to teach the college band, and an armorer, to be charged with the care of arms and drill-hall. The surplus, if any, may be used for the purchase of military equipment, military books, plans, and other apparatus of instruction.

3. The War Department shall appoint Commissioners, who shall prescribe a course of military education for these military colleges, and also a higher course for West Point, which shall be made of higher grade, and shall receive a part of its students from the graduates of the military colleges. These commissioners shall also appoint annually examiners, who, with examiners appointed by the Governor of the State, shall inspect the military colleges, and examine the classes, selecting from each graduating class —cadets, who shall enter the West Point school, with same pay and emoluments as enjoyed by the cadets of West Point.

4. The War Department shall furnish to the military colleges the necessary arms, accoutrements, camp equipage, and ammunition to be used in the instruction of classes and in the drill of all the students.

Seed Distribution by the Department.

Mr. EDMUNDS of Illinois offered the following resolution, which ought to have been adopted, but was laid on the table:

Resolved, That in the judgment of this Convention the purchase and distribution of seeds, plants, roots, &c., that are not new, and are not known or supposed to have a distinctive and especial economic value, warranting their introduction, should be discontinued by the Department of Agriculture.

Salary of the Commissioner of Agriculture.

Gen. HALSTED of New Jersey offered a resolution that Congress be petitioned to increase the salary of the Commissioner of Agriculture to $6,000, which was adopted.

A Committee to Represent the Convention in Congress.

Messrs. LORING of Massachusetts, BOWMAN of Kentucky, GREGORY of Illinois, TWOMBLY of Wisconsin, CORNELL of New York, and FOLWELL of Minnesota, were appointed a committee to ask Congress for an increased appropriation in aid of Agricultural Colleges.

President Loring's Closing Speech.

Before the adjournment Pres't LORING said:—The Chair takes this opportunity of returning thanks to the Convention for the pleasure he has experienced in presiding over its deliberations. The Convention has been to him one of extreme interest. I have endeavored to put practical agriculture in the foremost rank, and working as I have for years in Massachusetts with such men as Agassiz, who never do aught without a consultation with the practical farmers themselves, I have learned likewise to respect their views and do all I ever can to advance their interests. I think that the expressions of the opinions given here with regard to the agricultural condition of the country have been most refined and useful. [Applause.]

I do not think that this Convention traveled out of its record in taking into consideration and debating upon so important a question as the advancement of the youth of our country; and, as the presiding officer of this Convention, I do not accept the compliment that has been paid them by the Commissioner, when he said that he washed his hands clear of what he considered to be the folly of this Convention. [Applause.] I do not think that such criticism was at all necessary, but nevertheless I pass it over with this simple comment, knowing as I do that it will be lost sight of in the great good for which I believe we have laid a foundation for accomplishment. [Applause.] I think that you must go away with feelings of the greatest respect for each other, and with the assurance that agriculture has received an increased impetus by this general recognition upon the part of the Government of its interests. [Applause.]

Final Adjournment.

The Convention adjourned to meet the third Wednesday in February, 1873, at the call of a Committee consisting of Messrs. TWOMBLY of Wisconsin, SMYTH of New-Hampshire, CLARK of Massachusetts, and CORNELL of New York.

Field Crops.

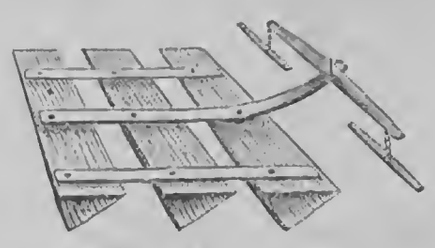
INDIANA CORN CULTURE.

I HAVE derived much valuable information from the columns of your paper, and have often felt a desire to contribute something to the general fund of agricultural information; but as often have been prevented, on account of not being able to give definite results. Much of the information from communications in your paper is only practicable on small farms, where enough stock is kept to consume all the produce, and even more, for we read of many farmers buying and consuming large amounts of grain, besides what they grow, in order to increase the manure heap. But thousands of your readers who grow corn by the one hundred to thousands of acres find such information impracticable; and I wish to express a few thoughts to those in regard to growing corn and marketing the same.

The ground I cultivate is in the valley of White River, Indiana, known as second bottom; not subject to overflow, and is a rich, vegetable loam. I have found great benefit from breaking stubble ground that was intended for corn as soon after harvesting as possible. Leaving a part of the ground without breaking after harvest, in the same field, I have broken it in spring, and have found the fall-plowed to increase the yield from ten to fifteen bushels per acre, and with far less labor to tend, as many of the weed seeds had germinated in the fall, after the breaking, and were destroyed by frost before maturing. The ground was also more mellow, and worked easier every way.

If the ground to be used for corn has been cultivated in corn the year before, and the stalks left standing, as they generally are throughout our corn-growing regions, there being but a very small proportion cut up, I dispose of the stalks by cutting close to the ground with hoes, raking with a horse rake into winrows, and burning clean. Some practice breaking down the stalks with a pole, when the ground is frozen, and turning under with the plow; but I have found this very annoying in laying off, planting, and first plowing after the corn is up, as the stalks are continually in the way, clogging the plow, and frequently tearing up the hill of young corn; and I think the former plan much better.

I now lay out the ground, after breaking from 6 to 9 inches deep, 3 feet 9 inches each way; drop and cover the way it was first laid off, and cover with a drag, which I have found the most valuable of any way that I have ever tried, and I have tried nearly every way known in the West. Any farmer, with an auger, ax and saw, can make one in two hours.



VIEW OF END AND TOP.

Cut off log 3 feet 11 inches long, 14 inches in diameter; split into 6 pieces, feather-edged, and 7 inches on the back; lay three of them down, and pin to pieces of 2 by 4 scantling on top—one near each end—and a third piece of scantling in the center, letting it project some 16 inches in front, with a hole bored in the end to hitch the double-trees to. The pieces of wood should be laid feather-edge to the front, and about nine inches apart; hitch your horses, straddle the row to be covered; let a boy about fourteen or fifteen years old drive, and ride on the drag. You can cover about eight acres a day.

Now as to the advantages:—1. At the time of covering the corn the whole surface of the ground is disturbed, and all vegetation, started to grow, destroyed. 2. The ground is better pulverized than any way I have ever tried, is left entirely level, and the furrows for planting obliterated. 3. The corn comes up on a level ground, and the ground is so completely mellowed that one can plow very close to it the first time, which I regard as very important, using a double-shovel plow, with a small shovel, or bull tongue, on the side next the corn (I use BOSWELL & BROS', all iron and steel, far superior in every respect to any I have ever seen used); at second plowing take off small shovel and put on the usual size, and cultivate five times; at second plowing don't leave a weed or blade of grass in the hill. What the plow does not cover up or destroy, pull out by hand; but with a good plowman and good plow there will be little to do of this back-breaking business. Thin to three stalks in a hill before the corn is knee high; when the ground is moist or wet never be tempted to leave more than three stalks to the hill; if I could always have two in every hill I would prefer it. Cultivate about every eight days, using only the double-shovel, leaving the ground as nearly level as possible when "laid by." I always plow until corn commences tasselling, and even after, if not prevented by storms tangling the corn, or intense heat. I have never yet known corn injured by plowing or cultivating it late. The last three plowings I would not plow so close to the corn or so deep as formerly. I have several times been stopped in the midst of a field, in late cultivation, by a storm twisting and blowing the corn, so that it could not be finished, and have invariably found that the corn last plowed was the best.

The time of planting must be governed by locality. The best guide, and most general I know of, is, when the "leaves of the Oak are as large as squirrels ears," and the ground not too wet. I think immense damage is done by breaking, planting, and cultivating, when the ground is too wet.

I have not said anything about the application of manures, as I have had but little experience in that way, and I suppose 75 per cent of the corn ground in our country is on land not manured. By the above mode of culture I have raised not less than 60 bushels of corn to the acre in the past twelve years, and sometimes as high as 95, without manure. What I have said, and may hereafter say, is only to apply to those regions where corn is grown extensively, and little manure made.

I am fully satisfied, from observation and experience, that Western farmers can increase the product of corn one-fourth, without the use of any manure, simply by more labor to the acre. I think 15 acres to the hand is as much as can be cultivated well. I know some farmers will laugh at this, and say a hand will tend from 20 to 25 acres; I will only say, I will admit they can *skim* over it.

I wish, in this article, to call attention more particularly to the manner of covering corn. I will give my experience and opinions as to marketing and disposing of corn in another communication.—WILLOW BROOK FARM, *Morgan Co., Ind.*

FIELD NOTES AND QUERIES.

Alsike Clover in Michigan.—SAMUEL BOOTH, Branch Co., Mich., writes the Western Rural:—"A year ago last Spring I hesitatingly purchased enough of the seed to sow twenty-five acres, it taking at the rate of four and one-third pounds to the acre, at one dollar per pound. I sowed in the month of April, on ground prepared for and sowed to wheat. I harrowed the ground, and afterward plastered it. Notwithstanding the dry season, I cut from that ground about forty tons of hay in July. I drew in my barn five tons for feeding; the balance I stacked, and in September threshed it and got eighty-five bushels of seed. Before cutting I brought in some stalks which measured four feet in length. The field on which it was sown is high rolling land, soil dark sandy loam. I am feeding this winter my entire stock, consisting of horses and cattle, on the hay that was threshed. They never thrived better on any feed than they do at the present time. It is free from fuzz and dust, and the stalk, unlike the other clover, remains green after the seed has ripened, and the cattle seize it with an avidity that would plainly indicate its superiority over the common red clover. It is also excellent for the honey bee, equal to if not surpassing the white clover. The first cutting produces the seed, and afterward excellent pasturage, but if preferred for hay and no seed, it produces two crops. With the knowledge I have of it, I would not recommend it for light yellow, sandy soil."

Big Crop of Peerless Potatoes.—In my sworn statement to the Ohio State Board of Agriculture (for which they awarded me the first premium for the best crop of potatoes), you will find that I harvested 317 bushels from one acre—280 bushels of Peerless from three-quarters of an acre; the balance were the Shaker Russetts. What P. D. H., in RURAL of Jan. 6, says of the Peerless as a cooking potato is very true. I find them white, dry and mealy.—NEW SUBSCRIBER, *Sandusky, O.*

Curing Tobacco.—I want to be informed of the best method of curing tobacco. Can you or any of your readers help me? I mean, by "curing," sweating it to make it ready for manufacturing.—E. W. ANDREWS.

Sheep Husbandry.

NOTES AND QUERIES.

Fine Wool Outside of Spain.—Some time since a two line item found its way into the RURAL NEW-YORKER, stating that "fifty years ago there was not a pound of fine wool grown outside of Spain." In response thereto, K. of Niles, Mich., writes: "Sixty years ago, JOHN R. LIVINGSTON of Red Hook, on the Hudson River, imported a flock of very fine Merino sheep from Spain, and bred from them for several years, the wool being noted for its fineness."

Sic Transit, Etc.—The famous flock of Rambouillet sheep is no more. We had the pleasure of seeing this flock at the French imperial farm of the same name, in 1867. At that time it consisted of about one thousand animals, including some four hundred breeding ewes. It was founded in 1786, by the present of a number of what were then regarded as choice Merinos, from the King of Spain to Louis XVI. Portraits in oil were taken of these, and are still preserved for the purpose of comparison with the later produce. The celebrity of the flock induced the importation of specimens into almost all countries growing fine wool; and the special points of excellence were their remarkable size and general fullness of muscular development as Merinos, together with the length and style of the wool staple. But "necessity knows no law:" the Prussian army must have meat, and recent accounts state that not a single specimen of the flock remains at Rambouillet to reproduce its kind. There are other flocks, however, in France, and probably elsewhere, in which may be found the pure blood Rambouillet French Merino, so that the loss, however serious, is perhaps not irreparable. —*National Live Stock Journal.*

N. GORHAM writes:—"Forty-eight years ago, I saw in Cayuga Co., N. Y., and personally examined, several flocks of fine wool sheep, (then popularly called Saxony,) of from three to eleven hundred each, and can give the names of the flockholders. Forty-three years ago my father purchased, through WM. PITKIN of Rochester, a full-bred Saxony buck, (and he was a fine wool sheep,) and brought him into Canada, where the animal was kept until he died, upon the farm where I now live. The original bill of sale of this sheep is now in my possession. Sixty-five years ago the French army of the first NAPOLEON had overrun Spain, captured and scattered the Royal flocks of Spain, and sent large numbers thereof to France, whereby was laid the foundation of the French Royal flocks of Rambouillet. Near the same time Col. HUMPHREY, then United States Minister at the Court of Spain, was instrumental in having sent to the United States the first fine wool sheep ever sent to America, of which we have any authentic record with which I am conversant."

Of course the RURAL NEW-YORKER had access, and knew of facts controverting the paragraph, which was admitted by oversight. We are not so sorry, however, as we might be, had it not brought the facts above given.

Profitable Leicester Ewes.—Who can beat this—the proceeds of nine Leicester ewes? They had seventeen lambs; two of them died shortly after they came; the remaining fifteen lived. Gave one away in consequence of the ewe not having sufficient feed for the two. Receipts as follows:

Wool, 54 pounds at 50 cents a pound,	$27.00
Premiums on ewes and lambs at fair,	11.00
Seven lambs sold,	35.00
Six lambs slaughtered and sold meat,	36.30
Six pelts,	9.00
	$117.30

The best ewe lamb, worth $6, was killed by cattle. One of the above lambs dressed sixty-eight pounds.—P. GRANT, *Fort Covington, N. Y.*

Weaning Lambs.—The Canada Farmer gives the following suggestions in regard to weaning lambs:—"When separated from the ewes, lambs should be placed in a field as distant as possible from them, so as to be out of reach of their bleating, and they will become contented and thriving. The pasture to which the lambs are put ought to be somewhat better than that to which they have been accustomed, yet not too luxuriant, and if the ewes and lambs can be turned into it together for a week, and then taken away, the lambs will not then fret so much as would be the case were they removed to a field that is strange to them."

To Kill Ticks on Sheep.—The best way that I have ever tried is to shear my sheep, then let them run for two weeks; the ticks will, during that time, nearly all collect on the lambs; then dip the lambs into a vat of strong tobacco juice; then hurdle the sheep and sprinkle the juice that remains on the sheep. This done, the ticks won't trouble you for three or four years again.—C. E. STRAIGHT, *Cuyahoga Co., O.*

Foot-Rot.—Will some of your readers give their mode of treatment (and success) of foot-rot among sheep.—C. S.

IN the Practical Shepherd, for sale at this office, detailed directions for the treatment of this disease are given, as they have been frequently given in these columns. We have no objections to hearing from correspondents, however, in response to this inquiry.

Lincolnshire and Leicesters for Combing Wools.—In answer to the inquiry about "Sheep for Combing Wools," in RURAL NEW-YORKER, Feb. 3, by J. W. H., Pikeville, Tenn., we can say for his benefit, that crossing a Lincolnshire ram on Leicester ewes produces an excellent staple for combing; and if properly cared for, will thrive in large flocks.—J. F. D., *Manlius, N. Y.*

The Apiarian.

HONEY BEES AND GRAPES.

UNDER the above, in RURAL NEW-YORKER of Feb. 10, in reply to "Porte Crayon's" assertion that three-fifths of the Concord grapes had been destroyed by the honey bee, you say, "We are inclined to doubt 'Porte Crayon's' theory or the accuracy of his observation; certainly shall doubt it until somebody confirms it." It is a source of some regret to me to be able (at least I think I am able) to furnish the confirmation. In 1870 I raised about 7,000 pounds Concord grapes—was the whole of September gathering them, 250 to 300 pounds per day. When a little more than half through, they were attacked by the honey bee, and in a few days they came in countless numbers, making great havoc with the grapes, destroying whole clusters, and many clusters upon the same vine, clearing out the pulp as clean as though drawn by human tongues, leaving the mutilated skins hanging to the stems. During the last two or three days' picking, I have no doubt the product had been reduced nearly or quite one half. Other vineyards in this vicinity suffered like depredations. W. B. PRATT.

Indianapolis, Ind., Feb., 1872.

E. COCHRAN writes us—I will vouch for the truth of "Porte Crayon's" theory, given in the RURAL NEW-YORKER of Feb. 10. I found that my Concord grapes were about one-fourth destroyed by the bees; and when the Concords were gone the bees went at my Isabellas, and destroyed a good many of them. When I was picking I had to tar the vines in order to get the bees off so that they would not sting my hands.

B., Elyria, O., writes:—"Bees have done great damage in this vicinity to grapes. The Italian bee has done the most injury, preferring the Catawba grape. Isabella and other varieties have been injured by the common bee.

BEE NOTES AND QUERIES.

How to Build a Bee-House.—In the RURAL NEW-YORKER of January 6th an inquiry was made, how to build a bee house. My neighbor has one in which he has kept bees for the last twelve years or more, and has made honey (box honey), without being bothered with swarming, only once in a while. He has some swarms in it he thinks have not swarmed while in there—twelve years. I built me one somewhat like his this winter. Mine is 22 feet 9 inches long, 4 feet wide, 5½ feet high, divided into 11 partitions, all inclosed with matched boards not planed. The roof is shingled; there is a door to each partition; partitioned with matched inch boards not planed. In each of these partitions I can put a swarm. Mine are the common box hive. Other hives might be used. I set my hive on slats, well secured, 22 inches from the floor; remove the bottom board of the hive so that all the dead bees and filth will drop on the floor, where it can be easily removed. I take the top board off and put one on half an inch thick, full of holes (this gives a circulation through the hive). On this board I put a box made of half-inch lumber, large enough to cover all the holes; each of these parts has a partition across, so the space where the hive is is two feet by one foot ten inches. —J. KLOCK, *Tioga Co., Pa.*

The Herdsman.

BRAN FOR STOCK.

AGAIN I say, save or procure a supply of bran and middlings. In answer to an inquiry some time since in regard to the value of the manure from a ton of hay, I made the statement that experiment had demonstrated that the manure from bran was more valuable than that from the same amount of weight of any of our common cereals—hay, straw or vegetables. I will make a few remarks on the value of bran as food and medicine for stock. I know it is spoken of and recommended by many, but it is not held in that degree of estimation to which it is entitled, nor used in the place, nor in the manner, its qualities would be likely to render it of the most value.

If you will go to the trouble of examining a table of its chemical analysis, and compare it with other articles of feed in common use, you will perhaps be able to form some conclusions when, and in what quantity, it will be a valuable addition to the other feed being used, in order to make up some deficiency, or counterbalance some excess of ingredients in the other more common articles of feed.

It is an invaluable article for feeding young, growing animals, presenting the necessary ingredients for the growth and strengthening of the frame. Whereas, with too rich a feed, a great portion of it would pass off in the excrements, and the system become clogged with excess of fatty matter, which could not be assimilated for want of a proportionate amount of bone and muscle-forming substance. And with it, you can obviate the necessity of going to the other extreme, as a great many do, and leave them on bulky feed which contains very little of either him or her, and of which the animal is not able to eat and digest sufficient to make much growth in either fat, blood or bones, and sometimes not even the necessary amount to keep its hide on.

It is the very thing to tone down the fevered and clogged system, resulting from colds, or an excess in feeding rich, fatty substances.

It will add tone and digestion to the weakened stomach, and vigor to the dull and stupid frame.

In the hands of a feeder who will pay sufficient attention to the condition of his animals to detect any irregularities of their system, and who will use some judgment, it can be made to render as effectual service in the cure and prevention of disease, as blue-mass and gruel soup in the hands of the medical profession. And like the gruel soup—which, if it or something equivalent to it, was administered at the proper time, it would be most likely to result in a cure or prevention, without the necessity of resorting to the use of the blue-mass—so bran can be made to check or prevent disease, and thus obviate the necessity of using powders, drenchings, &c., and thus divert the danger and debilitating effects attending their use.

For those who cook their coarse feed, or who give a liberal allowance of roots, its use would not be so much required. But I write this for the masses of the people, who neither cook their feed, nor yet feed roots, and with whom its use is most neglected, who yearly ship their shipstuff, or feed it injudiciously to get it out of the mail; leaving their young animals to become stinted on coarse feed, their milking ones to burn dry with carbon, their fattening ones to become diseased, and their sickly ones to die, all for the want of a proper proportion in the digestible ingredients of their feed.

Westmoreland Co., Pa. J. H. BENNETT.

NOTES FOR HERDSMEN.

Stanchions for Calves.—Seeing another invitation in the RURAL NEW-YORKER to contribute in regard to stanchions, I would impart an idea in the way of correction. I admire the plan of B. P. M. MALLORY'S stanchions given in RURAL, August 19, 1871; but I think his cattle must be rather thin necked if six inches is room enough for the same. The necks of my two-year-old cattle are over seven inches thick, and require a space of eight inches.

Again, a Mr. DAVID LOGAN, Jr., sends a sketch, published in the same number, and says he has used stanchions for many years, for all kinds of stock, from calves to heavy cows, and has never had reason to be dissatisfied. His luck is better than mine. Two years ago I wintered fourteen head of calves in stanchions. They came out with their horns standing in all directions, caused by knocking against the stanchions; and it is not very desirable to have a previously matched pair of steers with the horns of one standing up and the other down, and the other's horns turned in like those of a crumpled-horned cow. My plan is to either let the calves go loose in a pen or tie them with a rope. I have used stanchions for large cattle since I have owned cattle, and my father has used them since I can remember. I like them much.—I. S., *Corry, Pa.*

Soiling Cattle.—I look in vain for something in your columns on Soiling Cattle. The subject of wholly, or in part, soiling milch cows, is attracting considerable attention hereabouts. With high-priced land, and facilities for disposing of the milk product, such as cheese factories, creameries, &c., starting up all around us, we are surely drifting into keeping more cows on less land. How to do it, and do it well, is the question of importance. I want to try some Lucerne for soiling. Will you tell me how best to succeed with it? How much seed to the acre? How put in and when? Where can I get the seed best and cheapest?—C. A. WINDERS.

WE ask our readers having practical experience in soiling cattle, and with Lucerne, to reply for our correspondent's benefit. We are always glad to receive and publish practical experience in any department of husbandry.

Stanchions for Stock.—E. M. S. asks the RURAL NEW-YORKER "if, in its opinion, cows will do as well in stanchions as when tied." We reply, if we were going to fasten ten or a hundred cows, all things considered, we should regard the stanchion mode of fasteuing the most convenient, cheapest, tidiest, safest and best. This opinion is based upon considerable experience and observation. The same correspondent asks how Central N. Y. dairymen, near large factories fasten their, cows. Will Mr. WILLARD answer.

Industrial Societies.

The American Fish Culturists' Association has been holding a convention in Albany, and has elected the following officers for the ensuing year: *Pres't*—WILLIAM CLIFT. *Treas.*—B. F. Bowles. *Sec.*—R. Stone. *Ex. Com.*—Seth Green, J. D. Bridgman and A. C. Bupe. Resolutions were adopted to petition the Government to establish two or more fish-hatching establishments on Puget Sound and the Atlantic coast; to seek foreign exchanges; for a permanent fish exhibition in Central Park, and that the headquarters of the Association be at No. 10 Warren street, New York, where the next meeting will be held.

Caledonia Co., Vt., Ag. Soc.—Officers elect: *Pres.*—CHAS. A. SYLVESTER, St. Johnsbury. *Vice-Pres't's*—Calvin Morrill, St. Johnsbury; Joshua Bemis, Lyndon. *Secretaries*—I. W. Sanborn, Lyndonville; H. C. Hastings, N. M. Johnson, St. Johnsbury. *Treas.*—C. M. Stone, St. Johnsbury. At a special meeting of the Caledonia Agricultural Society, and representatives from the State Agricultural Society, held at St. Johnsbury recently, arrangements were made to hold the State Fair on the Caledonia Fair Grounds at St. Johnsbury, the second week in September next. —I. W. SANBORN.

The Farmers' Club of Monmouth Co., N. J., held its annual meeting Feb. 8th, at Freehold, and elected the following officers for 1872: *Pres.*—SAMUEL W. JONES. *Vice-Pres.*—Dr. J. C. Thompson. *Rec. Sec.*—S. E. Thompson. *Cor. Sec.*—D. A. Vanderveer. *Treas.*—John Dorrance. *Ex. Com.*—T. V. Dubois, W. T. Denise, Lafayette Schanck. Meetings are held on the second Thursdays in Feb., May, Aug., and Nov.

Lake Co., O., Ag. Soc.—Officers for 1872: *Pres.*—GEO. BLISH. *Vice-Pres't*—Jos. Stoker. *Treas.*—S. T. Ladd. *Sec.*—D. W. Mead. *Directors*—H. C. Rand, Madison; C. C. Jennings, Painesville, L. L. Kewish, Leroy; W. B. Tuttle, Concord; Thos. Thompson, Perry; E. T. C. Aldrich, Mentor; H. G. Tryon, Kirtland; Chas. Petton, Willoughby.

The Genesee Co., N. Y., Ag. Soc. held its annual meeting Jan. 9, 1872, when the following named officers were elected for the ensuing year: *Pres.*—E. TOWNSEND, Pavilion. *Vice-Pres'ts*—N. Moulthrop, Elba; S. B. Lusk, Batavia. *Sec.*—Geo. H. Robertson, Batavia. *Treas.*—A. R. Warner, Batavia.—GEO. H. ROBERTSON, Sec.

Ingham Co., Mich., Ag. Soc.—Officers for 1872: *Pres.*—Dr. W. W. ROOT. *Vice-Pres't's*—J. Craddock, Geo. Wilson and A. Hunt. *Sec.*—Geo. W. Bristol, Mason. *Treas.*—T. Dunmore. *Directors*—Wm. Somerville and N. Branch, which officers, together with four other Directors, constitute the "Board of Managers."

Northeastern Missouri Hort. Ass'n.—Officers elect for 1872: *Pres.*—Dr. R. N. ANDERSON. *Vice-Pres.*—Jasper Turner. *Rec. Sec.*—M. W. Wood. *Cor. Sec.*—A. B. Trabue. *Treas. and Librarian*—J. Smith. *Ag. Chemist*—Dr. W. A. Gordon. *Prof. of Horticulture*—D. Jenkins. *Dentomologist*—S. F. Taft.

The Wisconsin State Dairymen's Association.—Officers elect: *Pres.*—CHESTER HAZEN, Ladoga, Fond du Lac Co. *Vice-Prest's*—H. F. Dousman, Waterville, Waukeska Co., and H. Drake, Lake Mills, Jefferson Co. *Sec.*—W. D. Hoard, Lake Mills. *Treas.*—W. S. Green, Milford, Jefferson Co.

Kansas Stock Growers' Ass'n.—Officers elect for 1872: *Pres.*—L. D. BAILEY. *Vice-Prest's*—L. Sternberg, G. A. Crawford, O. W. Bill. *Sec.*—J. B. McAfee. *Treas.*—C. W. Jewell. *Ex. Com.*—J. K. Hudson, O. O. St. John, J. Yurann, D. B. Long, J. Haneday.

Chenango Co., N. Y., Ag. Soc.—Officers elect for 1872: *Pres.*—A. H. HOLCOMB, North Norwich. *Vice-Pres.*—S. F. Mills, Coventry. *Sec.*—R. A. Young, Norwich. *Treas.*—G. S. Mead, Norwich.

Sangamon Co., Ill., Ag. Soc.—Officers elect: *Pres.*—J. B. PERKINS. *Treas.*—John Williams. *Sec.*—W. O. Converse. Fair at Springfield, the week commencing Sept. 24, 1872.

Diary of a Ruralist.

DAILY RURAL LIFE.

FROM THE DIARY OF A GENTLEMAN NEAR NEW YORK CITY.

Cleaning up the Lawn.—*Feb.* 19.—It is really surprising what a quantity of materials will accumulate about one's house and lawns in winter. The snow is now gone and the ground bare, save the sticks, leaves and other *debris* which have accumulated from different sources. I even find many small stones on my lawns which would certainly interfere with the lawn mower, besides small branches that have been broken from the trees during heavy storms. These mild days which frequently occur during the latter part of winter should be taken advantage of for clearing up the lawn, garden and barnyard. If this kind of work is not done now, it is very likely to be left undone, when spring comes with its imperative demands upon our time. I am also having the manure in my barnyard forked over, the coarser materials, such as corn stalks, thrown into a separate heap, where it can be either drawn out separately and plowed under, or left to decompose until next fall. By the way, I have heard farmers complain about cornstalks being a great nuisance on account of their slow decomposition. It is true that they are not so readily handled as straw, but if put into a heap, and leaf mold or muck added, they make excellent manure. If the compost heap is forked over once a month during summer, it will be thoroughly decomposed by fall, and be in a suitable condition to apply to any soil or crop. The first time the heap is forked over the men will call it a "tough job;" but its fibrous nature will soon break down, and then it can be worked over as readily as almost any other compost.

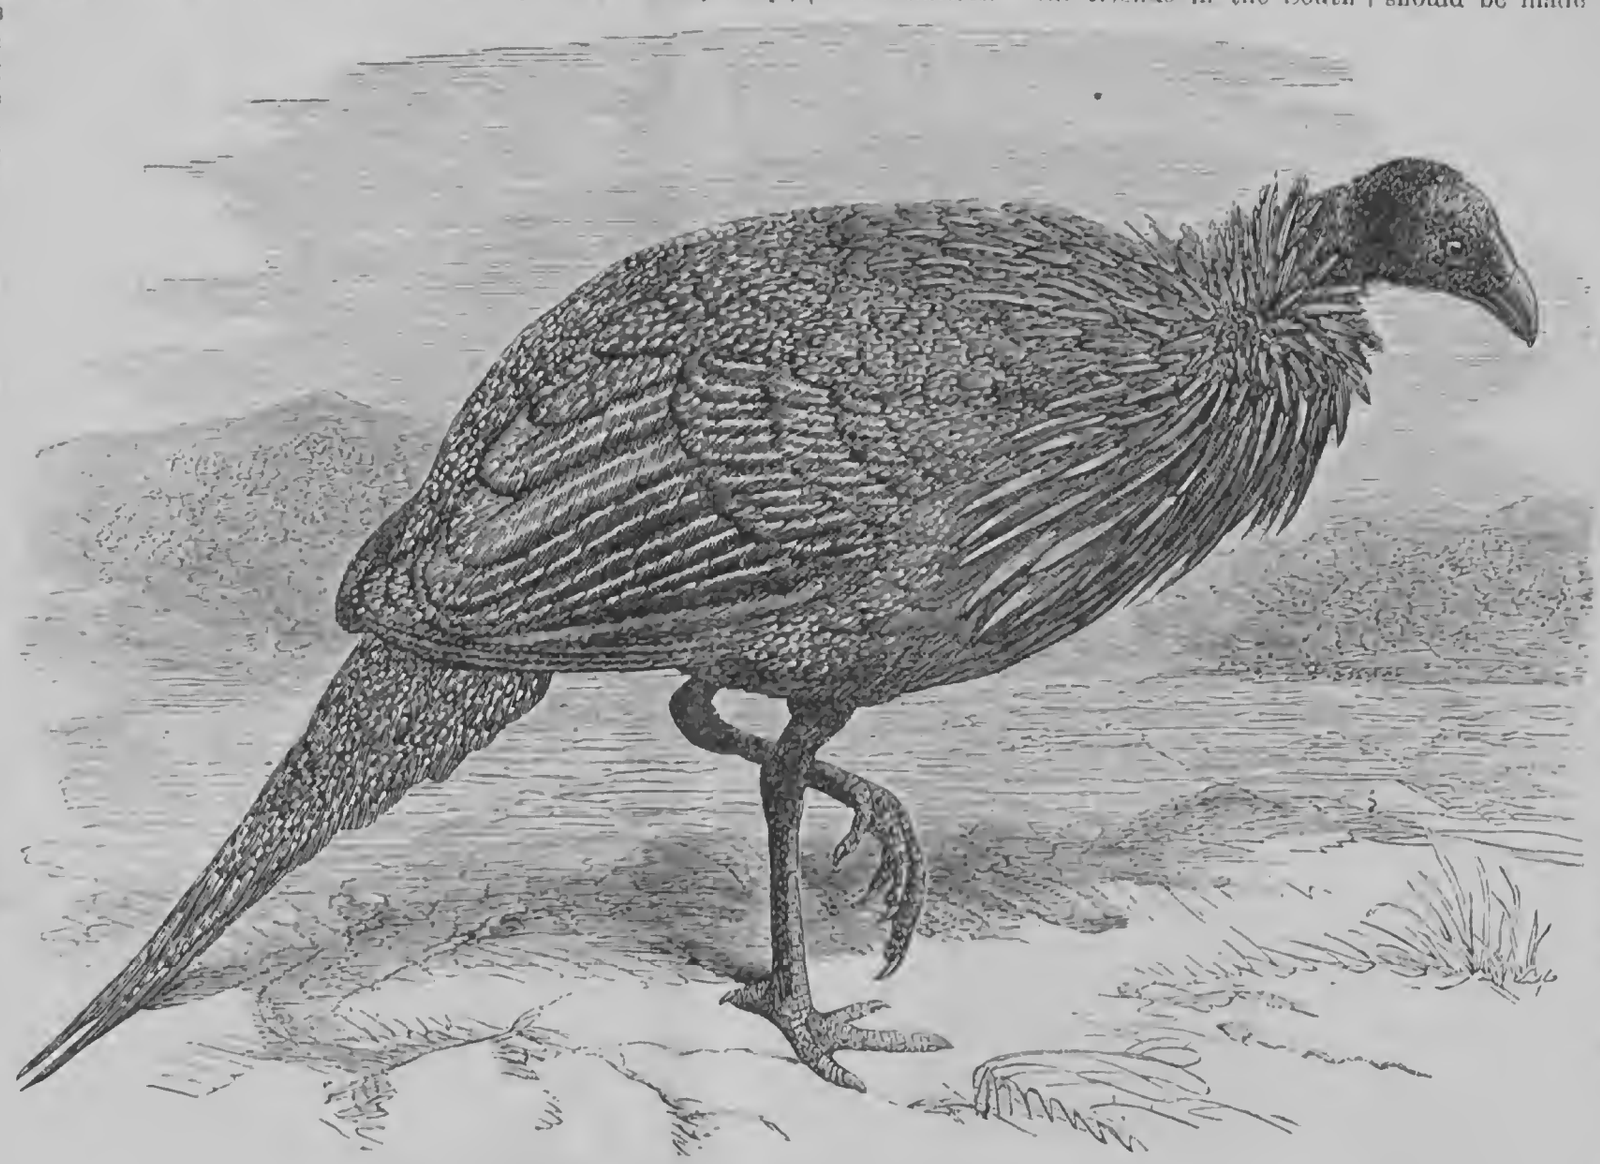
Arrival of the Blue-Bird.—*Feb.* 20.—A Blue-bird (*Sialis, sialis, Baird*) came near my office to-day and warbled forth a few notes—perhaps to let me know that spring was coming. Probably some one may think that those scientific names are entirely unnecessary; and so they are to those persons who are satisfied in calling every bird who has blue feathers a Blue-bird. But it so happens that there are a great many birds of this kind besides the several species of *Sialis*. The West and Southwestern Blue-bird (*S. Mexicana*) is quite distinct from our Eastern species; and the Rocky Mountain Blue-bird (*S. Arctica*) is different from either; therefore, one needs to know the locality of a writer, when he speaks of one of these birds, in order to determine which particular species of bird he is referring to, unless he uses its scientific name.

There is a great deal of needless talk and time wasted in discussing subjects relating to natural history, including agriculture and horticulture, in consequence of the multiplication of names applied to the same objects, which in reality convey no information, except to a few persons who happen to know their application; consequently, they are unnecessarily arbitrary. It is a great pity that our common schools cannot be conducted upon a more cosmopolitan system, and children taught to call things by their proper names, instead of having their minds filled with figurative nonsense, which only encourages local dialects, instead of language as well understood in one locality as another. But so long as our writers in high places are permitted to speak of *Trifolium pratense* (Red clover) as a "grass," there is little hope of reform in this direction. *Vide* a late monthly Report of Department of Agriculture.

Honey Bees vs. Flowers.—*Feb.* 21.—The bees in my apiary have waked from their semi-torpid state during the past few days, flying about quite briskly. But my green-house has proved to be a dangerous trap for this generally accredited to be very wise insect. The house must, of course, be ventilated during the warmest part of the day; and to do this the doors and ventilators are opened, and the bees, being attracted by the fragrant flowers, fly in, but not knowing enough to go out the same way, perish in great numbers. If my loss in bees should continue at the present rate, there would be few or none left in a few weeks; and the question to be settled is, whether I shall keep bees or green-house flowers. Of course netting could be placed over the ventilators and screen doors used; but the bees would be very likely to find an entrance, even if such precautionary measures were adopted. Something must be done quickly; for, to say nothing about the loss to my apiary, a green-house filled with live and half-dead bees flying in one's face or crawling up one's nether limbs, is not a pleasant resort for timid people, especially the fair sex, who are also attracted to gay-colored and fragrant flowers. My apiary stands only seventy-five feet from my green-house, which is altogether too near, as this season's experience has shown.

Washington's Birthday.—*Feb* 22.—Noble thoughts should possess the mind of every citizen of our great Republic on this day. I fear, however, that the "coming man" is more sincerely worshipped than the noblest among those that are gone. Perhaps this forgetting of the noble men of other days is in consonance with our American spirit of progression, and that we move more rapidly in consequence of cutting loose from the past.

To My Correspondents.—*Feb.* 23.—A number of young men who have evidently read my "Diary," in the RURAL NEW-YORKER, write me to ask if I cannot employ them on my farm, or in some way where they can learn something of "Rural Life." I should be happy to aid all such aspirants for a knowledge of things "natural," but regret my inability to do so. But there is room for all who may wish to work, or obtain a knowledge of such subjects, and any young man who has the requisite industry and perseverance, will meet few difficulties in the way of reaching an honorable position in society. There is, however, one fault which most young men have, and it is that they aspire to positions which men of age and experience now occupy.



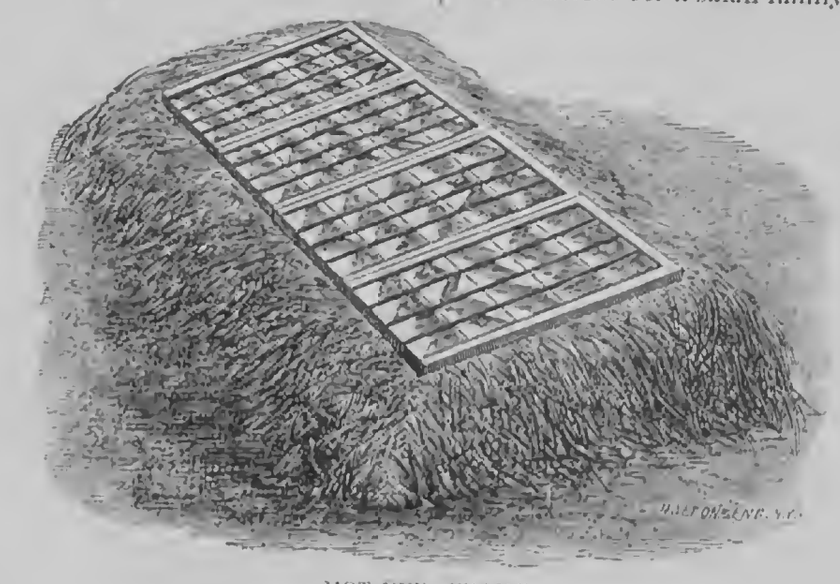
VULTURINE GUINEA FOWL.—Page 166.

The Gardener.

EARLY VEGETABLES.

The first of the spring months having arrived, we are reminded that early vegetables will soon be looked for, even in Northern localities. Our friends in the South may bask in the warm sunshine, and eat their crisp lettuce and early radishes from the open ground, long before we can produce them here in our hot-beds; but, as a rule, where nature is prodigal, her productions are not so highly appreciated as under circumstances quite the opposite; consequently, our rigorous climate stimulates us to greater exertions in producing luxuries, as well as the necessities of life.

Making Hot-Beds.—Every one who has a garden now-a-days is supposed to have frames and sashes for a hot-bed. If there should be any reader of the RURAL NEW-YORKER who has not provided himself with these very convenient, if not positively necessary adjuncts of the vegetable garden, it is time he commenced. A half dozen sash, three feet wide, and five or six long, will answer very well for starting early vegetables sufficient for a small family. The sash



HOT-BED FRAME.

should be made strong, and of well-seasoned pine plank, two inches thick. Glass 6 by 8, or 7 by 9, are good and economical sizes for this purpose; if larger, they are more liable to break, and the sash will be correspondingly weaker on account of lessening the number of longitudinal bars—there being, of course, no cross-bars, as in common window-sash. Frames on which the sashes are to rest can be made of any common boards or plank, a foot or more in width, nailed together, with a post or block in each corner, to increase the strength.

Making the Hot-Bed.—Fresh stable manure should be used, and that which is unfermented. Place a sufficient quantity in a heap, and fork over, occasionally, until it begins to ferment and heat. Then place it in some sheltered position, such as the South side of a tight board fence, or outbuilding, remembering that the deeper the manure the stronger and more lasting will be the heat. Eighteen inches is a good depth, but two feet is better; and be careful to have the heap of equal consistency throughout—not light and loose in one place and compact in another, for this would result in an unequal heat. The manure should be made firm, but not packed or tramped down. Make the bed at least a foot longer every way than the frame, and when the surface is made level, put on the frames and sash, and the whole should be made to appear as shown in the accompanying illustration. The outsides of the frames are banked up with manure, and the back side raised a little to give the sash sufficient inclination to carry off the water which may fall upon them in showers. This inclination may also be secured by making the front board of the frames narrower than the back; but when the frames are banked with manure this can be done by raising the back side five or six inches and securing it in this position. The soil may be put on immediately, or delayed a day or two until the manure is quite hot. Good, rich, friable soil should be used, and put on to the depth of five or six inches. Sow no seeds until it has become warmed through to the surface.

Sowing Seeds.—Tomatoes, radishes, lettuce, peppers, in fact all kinds of vegetables desired early, may be sown in the hot-bed. Sow the seed in drills five or six inches apart, running crossways of the frame, because it is more convenient to use a narrow hoe among the plants while standing in front of the bed, than if the rows run in the opposite direction. It is also desirable to sow a variety of seeds, because those that mature early in the bed, like radishes, may be used, and their places occupied with those kinds that require transplanting. There should also be sufficient room left in one end of the frame for transplanting the tomato and egg plants, which require to be kept growing in the frames until all danger of frost is past. A few good stocky plants are worth more than a great number of slender, weakly specimens, and these can only be secured by giving plenty of room, and perhaps occasionally pinching off the terminal shoot. Another requisite in producing stocky plants is in giving plenty of air on warm days; this prevents what is usually termed among gardeners "drawing up the plants." In very cold weather it will also be necessary to cover the sash with straw mats or old sacks, or some similar material. Of course this shuts out the light, and tends to make the plants weak; but when this covering is removed no air should be given immediately, but wait a few hours until the plants have hardened a little under the influence of the light.

Watering.—Care should be given to this operation. Do not deluge the plants one day and then neglect them for the next two or three, but see that they have just enough to keep the soil moist. Cold water from a well or cistern should not be applied, as it will be very likely to check growth; but let it be drawn a few hours before using, and put into a barrel or hogshead, and then placed in a warm place. If this does not suffice to raise the temperature, heat a few pails full over the kitchen stove, and pour this into the barrel containing that which is to be used.

Tender plants in hot beds, as well as conservatories, are often ruined by applying cold water. Success can only be secured through careful attention.

Growing Sage.—A Chenango Co., N. Y., correspondent asks those having experience to give their method of raising sage for market, the kind of seed, and when to sow and pick, how to cure, pack, etc.

Hygienic Information.

HYGIENIC NOTES AND QUERIES.

"Wild Tea"—A Cancer Cure.—Mr. YARDLEY, whose letter concerning a cancer cure we published in the RURAL NEW-YORKER Jan. 6., sends us a pulverized sample of the "Wild Tea" spoken of, which may be the foliage of Red Tops or Beach leaves or any other dried foliage. We cannot determine it botanically until we have a perfect leaf. Meantime we publish the following concerning Mr. YARDLEY, which we find in the Ithaca Journal:

One CHARLES YARDLEY, of Pittsburg, writes us a letter, as he has written a letter to every editor in the country, we guess, saying he was cured of cancer by using wild tea. Nobody but Mr. Y. has "wild tea," and he will swindle anybody who will trust him.

Remedy for Ringworms.—Acetic acid, applied with a small piece of sponge every morning, for about three weeks, caused a ringworm, which I had allowed to spread unnoticed until it covered the whole of my left cheek, to entirely disappear. This happened about two years ago, and I have not been troubled since.—T. G. A., *Washington, D. C.*

Dry and Cracked Fingers.—Why suffer with dry and cracked fingers? You need not if you will wash your hands thoroughly with Castile soap from time to time, and before retiring for the night rub them with glycerine and dry it in before the stove. Follow it up until warm weather comes. It is a preventive, no mistake about it.—W., *Rochester, N. Y.*

Cure for Ringworms.—Place two or three old copper pennies in a small earthen dish, and cover with strong vinegar; when the vinegar becomes of a dark green color, wet the parts affected with it two or three times a day. It has worked a perfect cure in a recent case in my family, where all other remedies failed.—MRS. W. W., *Stanwix, Oneida Co., N. Y.*

Frosted Feet.—Tell KATIE S. to send to the druggist s and get ten cents worth "Oil Origanum," and bathe the parts affected lightly with it two or three times, and she will feel no more of it. It is a sure remedy, one which I have never known to fail.—F., *New York city.*

Domestic Economy.

ABOUT PIES.

I HAVE noticed several articles on dyspepsia, in your valuable paper; many of them contain suggestions and recipes which are very valuable. I notice one recommends wheat bran as a remedy. That may be very good, but, I should judge, a dry dose to swallow. Now, I contend that wheaten grits, or cracked wheat, boiled, is a healthy diet for a dyspeptic—better than medicine, and very palatable, with a sauce of milk or cream and sugar. If they will persist in partaking of pastry, in the form of pies, allow me to give a few recipes, preferable to the much used and abused lard pie crusts:

Cream Pie Crust.—Take equal quantities Graham and white flour, wet with thin, sweet cream, roll thin, bake in hot oven, as common pie crust. Or take a piece of bread dough, after it has risen, and roll in a small piece of butter; roll out as pie crust.

Pumpkin Pie.—Stew, sift, add as much boiling milk as will make it about one-third thicker than for common pumpkin pie; sweeten with sugar or molasses, bake in a hot oven. Or add rolled cracker or flour to the sifted pumpkin; add milk to the thickness of common pumpkin pie. Squash and sweet potato pie are made in the same way.

Cranberry Pie.—Stew, strain through sieve, add sugar; bake on under crust.

Peach Pie.—Small, juicy peaches; fill pie dish; sprinkle sugar, a little flour, a tablespoonful of water; cover; bake one hour.

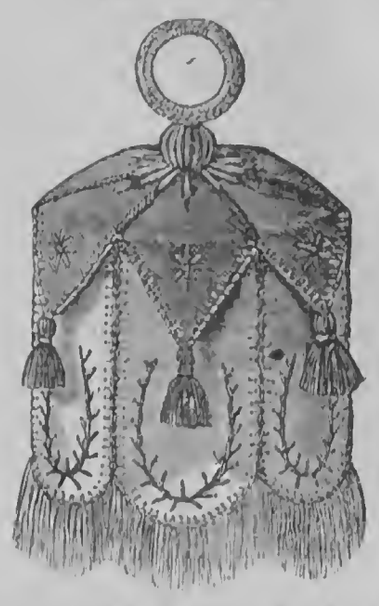
Apple Pie in the same way, with cream crust. A SUBSCRIBER.

ODDS AND ENDS.

House Furnishing.—The utility and neatness of white window shades bring them into general use. It is a fashion, of late, to trim the bottom with a row of white bullion fringe, which gives them an agreeable finish. Now that rooms are so much upholstered—window sills, mantles, chairs, etc., one can give a room a very cosy and charming appearance, by putting up little mantles and shelves, and upholstering them with some bright colored stuff, in harmony with the room. In this way remnants of goods, bright fringes, gimps and cords may be utilized.

EMBROIDERED TOILET PINCUSHION.—PAGE 167.

To Color Fur.—SARAH K. asks how she can color fur brown. We have seen the following recommended by one who has tried it, but we have never tested it:—Apply one ounce of crystallized nitrate of silver, eight ounces carbonate of ammonia, one and one-



LAMP-GLASS COVER.—PAGE 167.

half pints pure rain water, well corked and shaken, to the fur, and it will produce a beautiful brown. Repeat the process if it is desired to deepen to a dark brown or black. Apply the mixture with a brush.

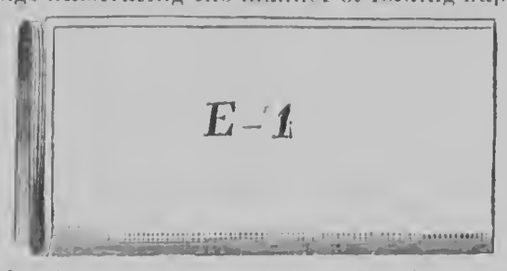
MUSLIN COLLAR.—PAGE 167.

Serving at Table.—If you employ no servants, train the children to wait on the table, taking turns regularly, a week at a time. Order, politeness, and rules of good breeding at table, do much toward refining

HANDKERCHIEF VIGNETTE.—PAGE 167.

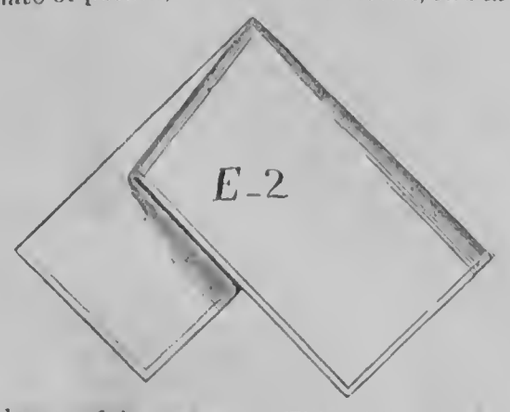
and fitting a family for cultivated society. Ease of manner is secured.

Folding Napkins "Lady's Slipper" Style.—We give another series of engravings illustrating the manner of folding napkins in what is called "Lady's Slipper" form:—E 1, first fold; E 2, second; E 3, third; E 4, fourth, and E, the final form, as it should appear upon the table.



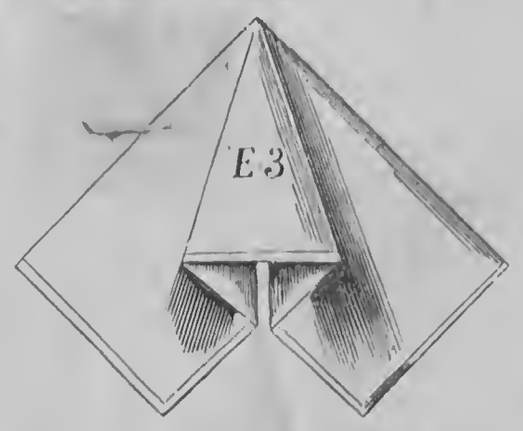
For Coloring Orange.—For six pounds of rags, use twelve ounces sugar of lead, six do. bichromate of potash, two quarts stone lime. Dip first in bichromate of potash, next in the sugar of lead, and lastly in the lime water, which must be boiling hot. Color resulting—a fast one.

To Color Blue.—Take three ounces prussiate of potash, one do. oil of vitriol, two ta-

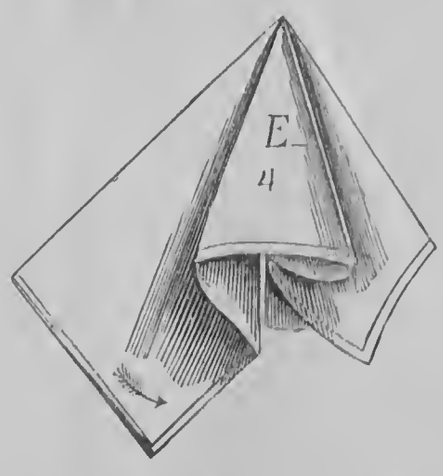


blespoonfuls copperas. This will color five pounds. Wash the rags clean, and then to

Color Green, dip the blue first into the bichromate of potash, next into the sugar of lead.—MRS. E. M. DAVIS.

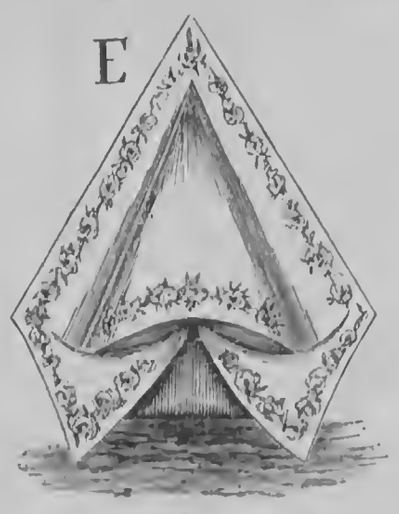


Fruit Creams.—Dissolve half an ounce of isinglass in water enough to cover it; add this to a pint of cream, sweetened with four spoonfuls of sugar, and boil it. When cool,



lay some apricot, raspberry or peach preserve in a glass dish, and pour the cream over it.

Butter in Small Tin Cans.—N., Clarendon, Vt., asks, "How will butter keep, put



up in small tin cans? Will it pay to do so for market use?" Let any one who has had experience answer.

The Vineyard.

THE GRAPE TRADE.

THERE is one feature of the grape trade that has developed itself this season, since the closing of the holiday trade, that I think is very important as well as interesting to growers:—that is, that since the holiday trade closed, which has formerly been considered the complete close of the trade, there is a good demand for Catawbas at an advanced price; and had some of the fruit received better care, no doubt it would have sold at better figures. This is a pleasing feature of the trade, for growers will not now be so anxious to force their fruit on the market in large quantities as formerly, and realize low prices. There is one cause for this state of trade that it is well to consider and prepare for in the future; it is, the quantity of foreign grapes that may be sent here. This season they have arrived in such poor condition that they were not fit for those to make use of who habitually buy them, consequently these parties were compelled to purchase the native fruit.

I have attended the auction sales where this fruit is sold, and seen several lots offered for sale, but they were in such bad order that no one would bid for them over the value of the package.

For the information of those not acquainted with this foreign article, I would say that the grape is white, large and very sweet, containing no pulp like ours, but a solid, meaty substance. These are packed in what is known to the trade as barrels and half-barrels, the first containing fifty pounds, the latter twenty-five pounds. For packing material, ground cork is made use of, it being cheap, and free from all offensive odor.

In regard to the outside demand, as we call it, for our native fruit the past season, I would say that it has increased very materially, and in places where the State fruit has entered into competition with the Western crop, it has taken the lead, particularly at the latter part of the season. Judging from the past season, in my opinion, the Southern States will require fifty per cent. more of Northern grapes next season than they did the last. Last fall I made two shipments of the Isabella and Catawba to Glasgow, Scotland; they arrived in good condition, but owing to their being so unlike any grape they have there, they did not sell well. They refused the Catawba, saying it was not ripe; but the Isabella, being black, was preferred, their grapes being either black or white. NOW AND THEN.

New York, Feb., 1872.

GRAFTING GRAPE VINES.

WILL you, or some of your numerous correspondents, please inform me, as soon as possible, as to the best time and method of grafting the grape vine, and oblige one of your readers?—E. SMITH, *Lake Co., Ohio.*

THERE are almost as many different methods of grafting grape vines as there are of fruit trees; also, as many different opinions among vineyardists in regard to the best time, some advocating one season, others another, these having arisen through the various degrees of success which have attended the operation in different hands and under diverse circumstances. If you wish to graft grape vines this spring, it will have to be done very early—*i. e.*, before the sap begins to flow, or you must wait until the vines have made a growth of several inches. If the cions are inserted at the time the sap is flowing most rapidly in spring, while it is very thin, and before any has been assimilated by the leaves, it will press through and over the cion, and, to use a common phrase, "draw it."

We have explained all this many times, giving the why and wherefore, according to our present knowledge of vegetable physiology; therefore pass over any further explanation at this time, merely stating that if the cions can be inserted a month before the vines commence growing, it is better than to wait until a later period. If this cannot be conveniently done, then wait until the young shoots are six inches to a foot long; then graft.

The cions should be cut and kept in a cool place, where they will remain dormant until used. Cut off the stocks a little below the surface, and insert the cion in the ordinary manner of cleft grafting. Tie in with string or bass bark, and draw the soil around the stock and cion, leaving only the bud exposed. The cions should not be over three or four inches long; consequently, if strong, long-jointed wood is used, there will be but one bud on each.

Dairy Husbandry.

THE DAIRY IN OHIO.

OHIO DAIRYING AND OHIO DAIRYMEN IN CONVENTION.

ONE of the most notable meetings of the present year was the annual gathering of Ohio dairymen, at Wellington, during the last week of January. Between five and six hundred people, it was estimated, were present at some of the sessions, and, whether in regard to numbers, or the practical bearing and usefulness of discussions, the meeting, it was said, surpassed anything of a similar character ever held in the State. We were present during the convention, and have seldom seen a more intelligent, earnest, and enthusiastic body of agriculturists gathered together.

Wellington as a Cheese Market.—Wellington seems to be a point well adapted for holding a convention of those engaged in the dairy interest. It is located on the Cleveland, Columbus & Cincinnati Railroad, about forty miles southwest of Cleveland, and easily reached from the East by the Lake Shore road.

Some idea of the dairy interest centering in Wellington is had from the fact that about 9,000,000 pounds of cheese are annually shipped from that point. Next to Little Falls, N. Y., Wellington can claim to be the largest country cheese market on the Continent. The cheese is bought, for the most part, by resident dealers, who fill orders from various sections of the country. One firm, that of WARNER & HORR, we were informed, has handled upward of 3,000,000 pounds of cheese during the past year. Their trade is mostly a home trade to the South and Southwest.

Dairy Products of Ohio.—Ohio is now the second great cheese-producing State in the Union. According to official statistics, recently received and presented to the Convention, the quantity of cheese made in the State during the year 1870 amounted to 41,381,033 pounds, and the quantity of butter for the same period, 43,020,551 pounds. As might be supposed, an interest of this magnitude has not sprung up suddenly, but has been gradually developed through a long series of years, and the business now rests upon a sound, substantial basis.

Milk Costs Less in Ohio than in New York.—The dairymen of Ohio have some advantages over their brother dairymen of New York. With cheaper lands, cheaper cows, and more economy in farm expenditures, milk is produced at less cost than in New York. The great bulk of Ohio cheese goes into the home trade, being shipped South and Southwest. New York being further from these markets than Ohio, gives the latter an important advantage in the cost of transportation, while some of the Ohio dealers seem to comprehend the best means of promoting home consumption and the opening up of new markets. Regular customers are supplied with "best goods," while refuse lots are often sent to New York city, to be sold for what they will bring. Recently some of their best cheese has been sent to Boston and Philadelphia, and has given good satisfaction—the dealers in these cities, as it was remarked at the Convention, often changing the brands and selling the samples as extra New York factory.

Improved Quality of Cheese.—Comparatively little Ohio cheese goes abroad. The style of manufacture is generally different from that known in New York as "shipping cheese." The Ohio cheese is less firm; it is thin in shape, being five or six inches deep, by fifteen to sixteen inches in diameter. Ohio cheese has improved in quality very much within the last half-dozen years. The impression has prevailed very generally at the East, that Ohio cheese must necessarily be rank in flavor, or have "a sharp, biting taste." In 1866 the London cheese mongers called our attention to this latter characteristic, suggesting that it might come from some peculiarity in the grasses upon which the cows feed. They stated that it was almost impossible to find an Ohio cheese free from this peculiarity. Whatever the cause may have been, the Ohio dairymen have, now, in a great measure, overcome this difficulty. At least, in our examination of a large stock of cheese while at Wellington, we did not meet with a single sample of the kind alluded to.

During the Convention we had ample opportunity to make a close inspection of Ohio factory cheese, in company with a New York expert. A stock of 15,000 cheeses, made at different factories, and some of them upon the factory shelves, were offered for our inspection, and a very large number of samples were tested. The quality of these samples was excellent, rich in meat, mellow in texture, mild and sweet in flavor. This lot was nearly all "fall make." Much of the October and November cheese contained all the cream of the milk, and if such was the character of goods sent to Boston and Philadelphia, we could readily understand how easily they would pass, when sold, as prime New York factory.

We should be glad if New York dealers would follow the lead of Ohio in opening up home markets and in promoting home consumption. Nearly all the best New York cheese now goes abroad. The medium and ordinary sorts are consumed at home. We cannot promote a rapid home consumption by offering consumers an inferior article. People will refrain from buying an article like cheese, unless it is to their taste, and it is the poor stuff that checks consumption and brings in its train low prices.

Dairy Lands, Comparative Profits, Etc.—During the morning session of the first day some valuable suggestions were presented in a letter from WALTER CARR & Co. of New York city. We give briefly some of the points urged in this communication:—There are millions of acres of land in this country, which, owing to the difficulties of tillage, would yield little or nothing if put to other uses than the production of milk. How would it be were these lands employed for beef, horses and sheep? Beef cannot be exported fresh, and of the salted material we have now more than can be sold at anything approaching living prices. If the lands were devoted to horses, a worthless surplus would soon be the result; if to sheep, a surplus of wool, added to what other countries unsuited to dairying must market here, would soon run prices down to a starvation point, and thin carcasses would be too abundant to find welcome market with the dogs. Hence the conclusion that the production of milk is the best use to which much of the land in this country can be applied. In regard to the question, "What we shall do with the milk?" farmers are advised to sell as much milk as possible by the quart or can, for consumption in some near city; then make the balance into some article of free consumption that can be exported.

Cheese or Butter?—The Messrs. CARR & Co. say that the tendency of things the past ten or twelve years has proven conclusively that our dairymen cannot put this surplus balance of milk over home wants into butter and get paid for the labor at the high rates which have ruled and still continue; and they think all that has saved dairy lands from becoming comparatively worthless and their owners from poverty has been, first, the production of milk in preference to other things, and, secondly, the converting of that into cheese which enters into free consumption in other countries at remunerative prices.

We are inclined to think that Messrs. CARR & Co. draw the line too sharply in favor of the production of cheese, and the tendency of their argument is to draw butter-makers into cheese production. If the prices of butter and cheese in England, during the past year, be compared, the assumption that cheese necessarily pays better as an article of export to that country may be doubted. French butter sold in England, the last week in January, at 156s. the cwt., while extra American cheese brought but 66s., and secondary sorts went as low as 45 to 50s. If we take the records of American dairymen for the past five years, we are inclined to believe the butter-makers have cleared more money than the cheese-makers. An equilibrium in the production of these two articles, it is evident, must be kept along with the consumptive demand, and any great falling off on one side, and increase on the other, will very sensibly disturb prices.

Requisites, etc.—In regard to Ohio cheese, Messrs. CARR & Co. say they are yearly ranking more favorably with the make of New York State, and to realize nearly or quite the same average of prices, only two things are necessary—namely, to make them of proper size and weight, and market them as soon as cured, while mild and sweet. Ohio cheese, they say, degenerates in flavor sooner than New York cheese; hence the importance of marketing them before the falling off in flavor.

They attribute this quicker degeneration to local peculiarities of water and soil, and, doubtless, these causes have much to do in the matter, since the land is more level in Ohio than New York, and springs and streams of running water are less abundant.

Size and Style of Cheese.—They recommend cheese designed for the New York market to be pressed in 16-inch hoops, and thick enough to weigh 40 to 45 pounds net. Such style of cheese, they say, is always available to the home trade, taking entire preference over N. Y. State, and are becoming more popular the last year or two with exporters; they no longer condemn it when the make and flavor suit. These statements are of importance to those who are manufacturing an article for the home trade.

Deficiency of Stocks.—In conclusion, they say that taking the receipts and exports from June 1, 1871, to January 2, 1872, the stock in New York is about 150,000 boxes short of January, 1871. By the following figures they show a probable deficiency of about 223,000 boxes from September 1, 1871, to May 1, 1872. Taking 311,911 boxes, the total receipts for the last four months of 1871, 1870, 1869 and 1868, and dividing the same by four, to get the average probable receipts for January, February, March and April, 1872, we find the same to average 77,977, which, added to 592,320, the receipts of the last four months of 1871, make the total receipts from September, 1871, to May, 1872, 670,297 boxes, which, compared with the same time last year, 895,187 boxes, shows a deficiency of 224,890 boxes.

Various questions were discussed during the day and evening, but nothing new or in advance of what has been brought out at the American Association was elicited. On the second day, quite an animated discussion was had upon the question—

Does it Pay to Mess Cows During the Grass Growing Season?—Mr. WELTON of Summit did not favor the practice, considering the expense too great to warrant the farmer in expecting an adequate return from the increased yield of milk. This opinion quite generally prevailed among members of the Convention, and it corresponds with the general impression among New York dairymen, who hold that good, sweet grass in abundance is the best and cheapest food for the production of milk. When this can be furnished to cows without stint, it does not pay to feed grain; but in case of short pastures, or scarcity of summer food, messing with bran, ships or meal may often be practiced with advantage.

Mr. BARTLETT of Franklin believed in messing cows at all seasons. He regarded the cow as a machine for manufacturing course feed into milk, and when it failed in the yield of that article, it had become admirably fitted for the butcher, and should be at once turned into beef. He was sustained in these views by several speakers.

Other Matters.—The annual address was delivered by Mr. X. A. WILLARD, after which several topics were discussed. We have no space in the present article to give a synopsis of the several papers read, or to follow the various speakers in the discussions, but we may take up such suggestions as appear new hereafter. One feature in the programme was novel, and seemed to be useful. It consisted in handing to the Secretary questions to be answered on any topic pertinent to the dairy. Any member of the Convention was at liberty to thus present a question in writing, and when the questions were all in, they were referred to a committee, who assigned them to certain persons for answer, giving ample time for deliberation on the topic assigned before the hour set down for answering, etc. A large amount of useful information was thus drawn out in a short space of time, and this feature proved of great interest and satisfaction to the Convention. The plan could be profitably introduced in dairy conventions East. On the whole the Ohio State Dairymen's Convention may be regarded as a great success, and cannot fail in being productive of much good.

Something New in Regard to Deaconing Calves.—Dr. G. F. COLE, Potsdam, N. Y., writes us in regard to deaconing calves as follows:—"I am informed that Farmer B—— of Vermont kills his calves immediately after they are dropped, and before they suck. He says the rennets are stronger; that he has compared them with rennets from calves killed when four days old, and the first were found superior to the last, every time. Again, that the skin of the calf that never sucked is tougher, will make better leather, that it wears longer, is more elastic, and is as heavy as the ordinary deacon skin, etc. In regard to the leather from such calves being better for shoes, Dr. COLE says he has been assured that it is a fact, from men who have handled the skins and made shoes from them, etc." We have had no practical experience in testing the rennets of calves killed as soon as dropped, nor do we know concerning the leather made from the skins of such calves. Perhaps some of our readers may be able to give facts coming within their experience or under their observation, in regard to this matter. The statements above presented are in opposition to the general opinion of dairymen.

The Poultry-Yard.

CARE OF POULTRY.

ANIMALS of all kinds, not properly cared for, give poor returns. No stock on the farm pays better, in proportion to its value, than poultry; yet in nineteen cases out of twenty, no provision whatever is made for the comfort or convenience of this kind of stock. Forced to seek shelter in some forsaken corner of an old and dilapidated barn, or the remains of a hog pen, and to live as best they may, on what they can pick up, they are condemned as unprofitable and an expense to the farm. A very trifling outlay would furnish a comfortable hennery, which their manure would in a short time amply repay, if properly applied to corn or any kind of vegetables. A hennery of inch matched boards, floor of coal or wood ashes, six inches deep, properly lighted and ventilated, in a dry location, and there remains but little care to produce profitable returns. My practice is, and has been for several years, to have a box of corn accessible at all times, so made that the grain falls into a small trough as eaten, and cannot be fouled. In the morning I give wheat screenings, which have been soaked in water over night, sufficient to last them half or two-thirds the day. In freezing weather, I pour boiling water on the feed half an hour before feeding. I am satisfied wheat screenings should always be wet, and after standing to allow the grain to swell, the water poured off and fed. This destroys the poisonous dust and smut that always accompany screenings. No feed for fowls is equal to wheat screenings. I give my fowls the offal from the kitchen, clean water, butcher's scraps three times a week, and they are free from disease. Forty pullets, and thirty hens eighteen months old, have laid 586 eggs in January past. I get usually, during the year, and for several years past, an average of 7,000 eggs from this number of fowls. I scatter ashes two or three times a week under the roosts and over the hennery, and have never had a lousy fowl. At sundown I gather the eggs. This process gives very little trouble. In addition, I break up, quite fine, clam shells, and occasionally throw a small quantity of quicklime in the water they drink. I keep the pure-blood Light Brahma, and no other.

LOCKPORT.

SPANGLED SILVER HAMBURGS.

IN RURAL NEW-YORKER of Jan. 6, you state, in answer to "New Subscriber," that all the sickle and principal feathers of a Spangled Silver Hamburg cock's tail should be white, with a black spot at the end of each; that is the "Standard of Excellence," as laid down both in America and England. Should "New Subscriber" try to get such birds, he may find some difficulty to procure them with perfect, clean, white tails, excepting the round, black spots. Should he order pure fowls of that breed and not find them so, he may think he has been cheated. It is certainly one of the best and hardest points to attain. Some that approach that point, often have breasts too black. I have visited yards of some of our best breeders, and found their experience to be like mine—only one of a large number have such perfectly marked tails. My object in writing this is to give information to amateurs; all breeders are well aware that all the spangled and penciled breeds of fowls seldom have all the plumage entirely perfect, according to the points given in the Standard of Excellence. Such birds are very rare. That is the standard of perfection we all try for, especially clear tails.

H. HALES.

Ridgewood, N. J.

POULTRY NOTES AND QUERIES.

Vulturine Guinea Fowl.—This singular looking fowl (see page 164) has been, for many years, regarded very rare; but recently it has been discovered that this bird is common on the southern part of the Somali coast and in the adjacent parts of Continental Africa. At Lamoo, on the east coast of Africa, it is found in market. Efforts are making to introduce them in England, with a view of adding them to the attractions of the English poultry yard.

Scurfy Legs.—My chickens have a disease on their legs and feet. It forms a thick, heavy, white crust, with a very rough surface. It broke out among my flock last summer, but did not appear to injure them until now. Several of them are stiff, and walk with difficulty. Will some of the poultry raisers tell, through the RURAL, what ails them, and suggest a remedy?—ROBERT TEASE.

Modes and Manners.

MINTWOOD'S CONVERSAZIONE.

Dresses for Three-Year-Olds.—NELLIE, Goffstown.—Keep your three-year-old boy in dresses another year. The kilt suits, with plain high waists, and worn with jacket, are the prettiest. Illustrations have been given in RURAL. The skirts are laid in overlapping side plaits, from top to bottom. For a dress suit, dark blue cloth, of pressed flannel, poplin, merino, or satinet, trimmed with white or black braid; a turban or sailor hat, a ruffle or collar at the neck, with a pink necktie; high button boots, with stockings suspended well above the knee.

A Dress for Spring, Head-Dress, Etc.—GERTRUDE.—For a dress for "spring and winter" wear, get black silk, cashmere, cupress cloth, or alpaca, as you can afford. "Plaids" are worn by children and young girls, but should *never* be chosen by a full grown woman, if she wishes to dress herself in the best taste. If a woman is ugly, a plaid dress only magnifies her ugliness, and ugly women are very sure to buy plaided gowns. The basque waist is still fashionable. "How can you make a head-dress to wear with a curled chignon?" Head-dresses are only worn by matrons, and they are made of points of lace, with lace ends falling at the back, and relieved with bows of bright ribbon. Young women wear braids of hair, or bands and bows of ribbon. Chignons are worn by some, but the small, compact coils of braid or loose, twist of hair, very simply arranged, are in better taste and in newer style. Ribbons worn in the hair and at the throat should be of the same color, unless that in the hair be black. A variety of colors suggests a barber's pole, or JOSEPH'S coat. "Should a person return a call made in her absence, when she hears of it through a third person?" If the third person was requested to inform you of the call having been made, or a card left, it would be in keeping with etiquette for you to return it.

Serving Tea and Coffee After Dinner.—HOUSEKEEPER.—At dinner, all beverages, such as tea, coffee, cocoa, etc., should be served after dessert. To serve it at the beginning or middle of the meal, signifies that you either do not understand or do not care for society usage in that respect. Water may be poured when soup is served, and a glass should be at every plate.

Coloring Red Hair.—JENNIE C. is informed that if we had red hair we would not color it, but try to render it as beautiful and becoming as we could by taking good care of it. No other color could be so well adapted to your complexion and features—no other color could render you more beautiful and attractive. Never sail under false colors!

Embroidered Toilet Pincushion.—This ornamental pincushion (see page 165) is made on a circular cushion 6 inches in diameter, the bottom being of thick pasteboard, the sides of strong calico, and the stuffing of bran. Cover the bottom with calico, sew a strip of calico 6 inches wide round the edge, draw up the other side of the calico strip so as to hold the bran, and stitch a small round piece of calico over the gathers. Then take two strips of blue silk 2 inches wide, and pinked on one side; one strip must be 52 inches long, the other 36 inches; pleat up the long strip into 16 double pleats, the strips into eight pleats, and sew them on the cushion according to illustration. Now cut out the star-shaped figure in white cloth, pinking out the edges, and embroider the design with colored braid and silk, and fasten it to the top of the cushion, so that the points of the star fit in between the pleats of the silk.

Embroidered Lamp-Glass Cover.—(See page 165.) This cover consists of two pieces of cardboard covered with cloth. Cover the lower piece with white cloth embroidered with red silk, and line it with red cloth, overcasting the white and red cloth together round the edges. Cover the upper portion with red cloth, embroider according to illustration with white silk, overcast the edges, and sew on a colored tassel at the tip of each point. Lay the red piece over the white piece, bend down the tabs and points. Sew on a colored silk knob and a brass ring, worked over with silk in the center, and add a bead fringe round the bottom.

Vignette for Handkerchief.—This pretty design (see page 165) may be worked on cambric or lawn in a variety of stitches with French embroidery cotton; or it may be executed in silks on velvet or leather for albums, writing cases, etc.

Muslin Collar.—On page 165 we give a design for a muslin collar, trimmed with lace quilling, which explains itself.

New Publications.

TWELVE MUSIC BOOKS
WHICH CONSTITUTE A
COMPLETE MUSICAL LIBRARY!
1200 or more Songs and Pieces for Piano-Forte or Reed Organ. Worth from $300 to $400. Sold in book form for $30!!

THE MUSICAL TREASURE. *Vocal and Instrumental.* The most recent work. Very popular.
THE SILVER CHORD. *Vocal.* Large number of the best Songs.

"PROGRESS AND IMPROVEMENT."

MOORE'S RURAL NEW-YORKER.

A NATIONAL ILLUSTRATED

RURAL, LITERARY AND FAMILY NEWSPAPER.

D. D. T. MOORE,

Conducting Editor and Proprietor.

PUBLICATION OFFICES:

No 5 Beekman Street, New York City, and No. 82 Buffalo Street, Rochester, N. Y.

WESTERN BRANCH OFFICE:

No. 75 North Side of Park, Cleveland, Ohio.

TERMS, IN ADVANCE:

Subscription.—Single Copy, $2.50 per Year. To Clubs:—Five Copies, and one copy free to Agent or getter up of Club, for $12.50; Seven Copies and one free, for $16; Ten Copies, and one free, $20—only $2 per copy. As we are obliged to pre-pay the American postage on papers mailed to foreign countries, Twenty Cents should be added to above rates for each yearly copy mailed to Canada, and One Dollar per copy to Europe. Drafts, Post-Office Money Orders and Registered Letters may be mailed at our risk. ☞ Liberal Premiums to all Club Agents who do not take free copies. Specimen Numbers, Show-Bills, &c., sent free.

The Rural New-Yorker is sold by News Dealers generally throughout the United States and Canada at Six Cents. The Trade is supplied by the AMERICAN NEWS CO., 119-121 Nassau St., New York.

Advertising.—Inside, 75 cents per line, Agate space; Outside, $1 per line, each insertion. For Extra Display and Cuts, a price and a-half. Special and Business Notices, $1.50 and $2 a line. No advertisement inserted for less than $3.

SATURDAY, MARCH 9, 1872.

SPECIAL NOTICE TO ADVERTISERS.

INCREASE OF RATES.

AFTER April 1, 1872, the Rates for Advertising in MOORE'S RURAL NEW-YORKER will be as follows:

Inside, 14th and 15th pages (Agate space)..90c. per line.	
" 5th, 7th, and 13 pages.....1.00	"
Outside or last page, ...1.50	"
Fifty per cent. extra for unusual display.	
Special Notices, leaded, (by count).....2.00	"
Business " 2.50	"
Reading " 3.00	"

All orders for Advertising received at the New York office on or before April 1st will be charged at present rates only. For at least one cogent reason for our advance, or "New Departure," in Advertising Rates, see RURAL Feb. 24.

OUR SPRING CAMPAIGN!

The Spring Campaign of the RURAL NEW-YORKER opens with March, and we desire every Agent, or other friend of the paper who can do so, to "pitch right in" and make additions to present Clubs, or form new ones—for which we Offer and Pay most Liberal Premiums.

THE RURAL'S "NEW DEPARTURE"

Has already proved a great success—the form and style adopted Jan. 1st, receiving the approval and commendation of both Press and People all over the Continent. No change in a journal was ever pronounced so great an improvement. Thousands who never took the RURAL before, are now its subscribers and ardent admirers, while old subscribers, with scarcely an exception, say the change is all right.

TAKE PARTICULAR NOTICE THAT

Agents and other friends will find it for their interest to add to present and form new clubs—for our inducements are so substantial that every one will be richly rewarded. Show the RURAL to your friends—take a copy to the polls on Election Day, (we will replace any you soil or lose,) and "don't forget to remember" to tell everybody you meet that this is *the* paper for themselves, their families and friends.

By proper effort, everybody can

MAKE MONEY IN MARCH!

For it is a good month to "*March On to Victory*," by filling up or forming clubs. As Spring comes on, thousands, in both Town and Country, want the RURAL, because it tells them all about Gardening, Floriculture, Arboriculture, Etc., as well as Farming, Stock Breeding, Sheep and Dairy Husbandry, &c., &c.

YOU CAN BEGIN AT ANY TIME!

Good Friends! go in for the benefit of yourselves and your neighbors—for every one who subscribes will be benefited, while your kind exercise of influence will be rewarded.

As the RURAL is electrotyped, back numbers can be furnished from Jan. 1st, or, if preferred, subscribers can commence now, or at any time.

RURAL NOTES AND QUERIES.

British Imports of Wheat.—The Country Gentleman thus summarizes the available figures.—The published statement of British imports of wheat for 1871, shows that the quantity received during the year was 39,407,616 cwt., against 30,901,229 cwt., in 1870. Russia furnished 15,629,435 cwt., and the United States 13,405,057 cwt., but the two countries are placed more nearly on an equality when we find that 1,794,805 cwt. of wheat flour was also brought from the United States and none from Russia. Indeed the aggregate value of our wheat and flour was £9,459,740, against £8,340,597 for Russian wheat, so that we actually exceeded Russia in our supplies for the British market, and sent thither considerably more than all other countries combined. The aggregate cost of British purchases of wheat and flour from other nations was £26,783,914 in 1871, against £19,617,678 in 1870—an increase of over seven millions pounds sterling, equal at present rates of exchange to about $38,000,000 in currency.

The War Among the Roses.—Potatoes—waxes warm as the spring days come on. Mr. CAMPBELL'S article on "Seedlings vs. Sports," in our issue of Feb. 17, induced Dr. HEXAMER to exhibit, at the last meeting of the Farmers' Club of the American Institute, samples of the half dozen, more or less, "Late Rose" potatoes which are now competing with each other in the market for supremacy as a *late* complement of the Early Rose. Now we are perfectly willing each one of these potatoes, worthy of it, should be widely disseminated; but we desire our readers to distinctly understand that there is no "*The* Late Rose;" there are several of them, each distinct from the other. We do not know which is best, and it is not probable we shall, until we have tested them. We do not advise our readers to "dip in" too heavily in any one of these Late Roses: nor do we discourage any one, who can afford it, from testing all of them. Our advice, in the matter of nomenclature, would be that the originator of each drop the name "Rose" and prefix his own name to the word "Late"—say "Campbell's Late," etc. We do not, it is proper to say, agree with Mr. CAMPBELL, in his low estimate of the permanency of "sports." Our own experience disproves it.

Catalogues, &c., Received.—From WILLIAM & THOMAS SMITH, Geneva, N. Y., descriptive Catalogue of Ornamental Trees, Shrubs and Roses. From LUTHER HOLMES, Sec. of Ag. and Mech. Ass'n of Louisiana, Rules, Regulations and Schedule of Premiums for the Sixth State Fair of Louisiana, to be held at New Orleans, April 24-30. From HENDERSON & CO., Real Estate Agents, Boston, Mass., their Rural Advertiser of landed property for sale. From W. & T. SMITH, Geneva, N. Y., Catalogue of Fruits. From E. M. WAITE, Sec., list of Premiums awarded at Oregon State Fair, 1871. From W. C. STRONG & CO., Brighton, Mass., catalogue of New and Rare Plants. From WM. KING & SON, Rochester, N. Y., descriptive catalogue of Green-house and Hot-house Plants, &c. From CHAS. MILLAR & SON, Utica, N. Y., Illustrated Circular and Price List of articles for cheese factory and dairy use. From REISIG & HEXAMER, New Castle, N. Y., catalogue of Small Fruits, Seed Potatoes, Seeds, &c. From R. D. HAWLEY, Hartford, Conn., catalogue of Genuine Wethersfield Garden and Agricultural Seeds. From OLM BROS., Springfield, Illinois, Annual Plant Catalogue. From D. H. BROWN & SONS, New Brunswick, N. J., descriptive Catalogue of Garden, Field and Flower Seeds, Small Fruits, Vegetables, &c. From H. A. CATLIN, Corry, Pa., catalogue of New and Rare Plants.

The Late Agricultural Convention at Washington.—In Forney's Press, THOMAS MEEHAN thus comments upon the antagonism resulting between the Convention and Commissioner WATTS, in relation to representation in the Convention: "Instead of fifty or sixty gentlemen representing as many State Agricultural Societies and Colleges, some two hundred presented themselves for admission. It was a wonderful illustration of the great interest felt in agriculture. Here were men from nearly every State and Territory in the Union, Arkansas, Texas and Florida being the only ones not represented. Even Utah had a delegate knocking at the door. These gentlemen came—many of them over a thousand miles—solely at their own expense in time and money, and without the expectation of any personal reward in any way, to offer their encouragement and exert their influence for the great agricultural cause. The friends of agriculture welcomed their appearance with much enthusiasm, and were much annoyed when Commissioner WATTS rose to open the meeting, and told them that they were not wanted there. The meeting, however, took a different view from that of the Commissioner. Instead of feeling insulted by the presence of these gentlemen, the delegates whom the Commissioner intended only to invite regarded it as a compliment, and, especially in view of the great number of leading minds among them, rejoiced in the opportunity of having them to consult with. And thus it happened that in spite of the protestations of the Commissioner they were elected to full seats in the Convention.

"This at once placed the meeting in antagonism to Judge WATTS, and the result was the election to the chair of Dr. GEORGE B. LORING of Massachusetts, who was one of the gentlemen the Commissioner wished to rule out. If the Commissioner ever had any distinct plan in his mind when the Convention was called, this opposition must have soured him, and prevented his fully presenting it. There seemed to be no definite point to be discussed, and hence the whole proceedings resulted in little more than a great mass meeting, in which nearly half the time was occupied in organizing and preparing business, and the other half in offering resolutions by individual members on all sorts of schemes and topics having a bearing on the general subject of agriculture. The Commissioner could not resign himself gracefully to his fate. On one occasion he rose and protested against what he termed the folly of the Convention, contending that 'the funeral was none of his,' and that 'he washed his hands of all responsibility' in the matter; and subsequently, when asked to publish an abstract of the proceedings in the agricultural report, gave much offense by remarking that he was only authorized by law to print 'agricultural information.'

"Though the main design of the Commissioner in calling this meeting together may have been frustrated, the results in the way of valuable suggestions in the interest of agricultural progress were by no means small. This was to be anticipated by any one who looked at the *personnel* of the Convention. No more intelligent body of men was ever gathered together to discuss the interests of products of the earth. No pursuit will draw together men of so many shades of political opinion as this."

It is Well to Have Something to Think About.—As a rule, there is too little thinking done by farmers. They think of their "hard lot"—of the isolated life they lead, and nurse the belief that every man's (in other vocations) hand is against them. We like the course of the Waltham Farmers' Club, Mass., which has published the following topics for thought and discussion at its meetings during the year. Other clubs ought to imitate it. It will help men to concentrate their attention and observation, and think with a purpose. Here is the programme for discussion in 1872:

The results of farming in 1871, and what has been learned that will be beneficial to the future.
Has the importation of foreign breeds of cattle, horses and other stock been a benefit to the community?
Trades and trade unions; their influence on the business of the community. Would a combination of the farming interests be a benefit to their general prosperity?
Woodland and forest trees; their advantages or disadvantages to the farm and community.
Farm and farmers; what are the indications of good farming?
Swine and poultry; best breeds of each, and the best method of keeping and feeding, and the profit and loss.
Fruits and vegetables; proper time to gather, and the best way of preserving them.
Milch cows; feeding and management in regard to health and the production of milk.
The raising, feeding, and training of horses for speed, road, and farm work.

Personal.—Mr. A. B. CRANDELL, the Agricultural Editor of the World the past two or three years, has resigned his position to accept the place of Agricultural Editor of the Weekly Tribune, as successor to the late JOSEPH B. LYMAN. Mr. CRANDELL is an industrious, faithful journalist, a ready reporter, and a worthy successor to Mr. LYMAN. Prof. H. E. COLTON, late of the Tribune, succeeds Mr. CRANDELL as Agricultural Editor of the World. Prof. COLTON has had opportunities for extended observation, and is a careful, conscientious writer upon practical topics.

Notice to Advertisers.—The favors of advertisers, (especially during the busy Spring season,) should reach our New York Office ten days in advance of the date of the paper in which it is desired that they should appear. We are obliged to omit over a column of new advertisements this week, for the reason that most of our pages had been sent to electrotyper before their arrival. Please "make a note" of this.

Samuel Wagner—Obituary.—We see it announced that SAMUEL WAGNER, late Editor of the American Bee Journal, died Jan. 17th. Mr. WAGNER was justly regarded a reliable authority in his specialty, and is pronounced a most worthy man by his personal friends. We announce his decease with profound regret.

RURAL BREVITIES.

OHIO farmers have organized Cow Insurance Companies.

FARMERS are burning corn in Butler Co., Iowa, because of the scarcity of other fuel.

THERE are reported to be about 20,000 bales of hops in the New York market.

HORACE GREELEY is to deliver the Annual Address at the next Fair of the Vermont State Ag. Soc.

FORTY thousand bushels of onions were raised in the Holland settlement, near Chicago, the past season—so it is asserted.

NORFOLK Red Polled Cattle are to be imported into this country for the first time this spring. A. B. ALLEN praises them.

BOSTON has three distinct Milk Associations—a Producer's, Peddler's and Consumer's. They ought to regulate the milk business.

ILLINOIS farmers are feeding their partridges this winter, because they do such good service in destroying chinch bugs. Sensible!

A FARMERS' Co-operative Society has been organized at Farmington, Kan., and a co-operative store is to be started thereby.

AT Indianapolis, Ind., the past season, 180,509 hogs have been slaughtered; cost $919,827.34; capital invested in the business, $4,461,229.

THE Maine State Agricultural College is likely to receive an appropriation of $25,000 from the State this year; it has already received $88,000.

SAMUEL L. BOARDMAN, Editor of the Maine Farmer, has been appointed a member of the Maine Board of Agriculture, in place of Prof. HAMLIN of Colby University, resigned.

BUSINESS INFORMATION.

The Averill Chemical Paint.—We see that Professors CASSELS of the State University of Ohio, CHANDLER of New York, SILLIMAN of New Haven, LANSZWEERT of California and some others of the ablest chemists in the country, have analyzed the Averill Chemical Paint and pronounced it to be composed of the most indestructible materials known; and that the chemical combination of these ingredients by the inventor, in the product known as the Averill Chemical Paint, has given to the world the most durable article of paint heretofore known. They also assert that its preserving properties are unsurpassed. The above, taken in connection with the opinion of the many owners of fine buildings who have used this article, would seem to be sufficient guarantee of its worth. Those having buildings to paint would do well to obtain sample cards and recommends, which are furnished gratuitously by the Averill Paint Co., 32 Burling Slip, N. Y.

The Perkins & House Lamp.—Some three years ago we gave a short notice of this lamp. Since that time we have had one of the lamps in constant use, and consider it worthy of all praise. It gives a clear white light, and plenty of it; is handsome and strong, and, we believe, safe in all contingencies, and with all kinds of oil. We feel sure that even the dangerous "safety" kind can be used with impunity in this lamp. As a further guard against "kerosene murders," the Cleveland Non-Explosive Lamp Co. have devised a Safety-Filling Can, in which all the orifices are so protected by wire gauze that flame cannot reach the inside, and explosion is rendered impossible. The Perkins and House Metallic Safety Lamp Co. of Cleveland, O., and 42 Barclay St., N. Y., supply these Lamps and Fillers in ample quantity and of perfect manufacture.

A Desirable Investment.—Messrs. FISK & HATCH, the well-known bankers, who are now acting as financial agents of the Chesapeake and Ohio Railroad Company, on the last page of this issue set forth very succinctly and fairly the merits and advantages of the six per cent. bonds of that Company, which have been received with marked favor by the capitalists in this market. This Company is old and well established, and is just completing a very valuable and important railroad property, which has an uncommonly bright prospect ahead. The officers and directors, moreover, are composed of some of the best known and strongest business men and capitalists of the country, which fact is one of the strongest guarantees that any obligation can have for safety and certainty of income.

Harrington's Seed Sower and Hand Cultivator.—This implement, made by the Ames Plow Company, 53 Beekman St., New York, combines the Sower and Cultivator in one machine, and is the only combined one made. See advertisement on page 174.

PUBLISHER'S SPECIAL NOTICES.

The Rural New-Yorker is electrotyped, and hence Back Numbers can always be supplied. Copies for sale by all News Dealers; price Six Cents.

March on During March!—Is what all our Agents, and others disposed to form Clubs, should do. It will not only pay to enlarge present Clubs but to form new ones. It is an easy matter to recruit for the new style RURAL, and PAYS both Agent and Subscribers—and now is the best time to do "that same."

Additions to Clubs are always in order, whether in ones, twos, fives, tens, or more. A host of people are subscribing for papers about these days, and we hope our Agent-Friends will give everybody an opportunity to subscribe for the best.

BUSINESS NOTICES.

THE ADVANTAGES

Of using DOOLEY'S YEAST POWDER are shown in its superior excellence over all others, by which elegant, light, sweet rolls, biscuits, bread, pastry, &c., can be made with very little trouble; food that can be eaten with impunity and relished by the most sensitive dyspeptic or invalid. It permits no waste of flour prepared with it, and the quantity required to be used of DOOLEY'S YEAST POWDER is one-third or one-half less than those of other manufacturers. Try it and be convinced. For sale by Grocers everywhere.

DR. STRONG'S REMEDIAL INSTITUTE,

Saratoga Springs, N. Y., is unsurpassed in the treatment of Lung, Female and Chronic Diseases. Turkish, Russian, Electro-Thermal and Sulphur-Air Baths, Hydropathy, Vacuum Treatment, Movement Cure, Oxygen, Calisthenics, &c. TERMS LOWEST IN WINTER. Send for a Circular. Endorsed by Bishop Janes, Rev. T. L. Cuyler, D. D., and Tayler Lewis, LL. D.

One Cold after Another, will, with many constitutions, securely establish the seeds of Consumption in the system. Those in need of a remedy will find Dr. Jayne's Expectorant always prompt, thorough and efficacious.

Attend to the First Symptoms of Consumption, and check the disease in its incipiency by using JAYNE'S EXPECTORANT, a safe remedy for all affections of the Lungs and Bronchia.

HOW TO OBTAIN A "COLLINS"

Solid *Cast* Cast-Steel Plow for $5. For particulars, address COLLINS & CO., 212 Water St., N.

The Traveler.

SKETCHES IN ROME.

Five miles from Rome we passed upon our right the stupendous ruins known as *Roma Vecchia di Frescati*, called by some the *Sette Bassi*. With the blue sky breaking through their somber arches, the tall isolated towers netted with ivy, the broken walls opening into dark corridors, and detached masses of ruins — brickwork and stone—spreading their desolation over an area of more than four thousand feet in circumference, they formed a scene inexpressibly grand and interesting. In the days of the consuls this was the site of one of the Alban cities. In later times its whole surface was covered by a suburban villa. Some antiquarians affirm it to have belonged to the Emperor Hadrian, others to Commodus. But it matters little now. They have but the owls and rocks to dispute their claim.

We soon reached the little *osteria*, or inn, marking half way to Frescati. Dogs and goats, with cackling fowls and strutting pigeons, crowded the doorway. At a little table outside sat two of the Papal Zouaves, quaffing wine with a hunter in picturesque garb, whose game-bag and gun rested against the side of the house. Within the dark portals sat an old woman knitting. A pretty young *contadina*, in gay costume, stood coquettishly within sight of the gallant Zouaves, while the mother of a troup of children, one in her arms, and the others at her heels, was apparently busy preparing the dinner for her guests. A large tortoise shell cat lay basking in the sun, her nose suspiciously near the game-bag of the hunter. The inn stood a little upon one side of the road, and then turning from it was a narrow shady lane, terminated by an arch, through which sheep and oxen were seen browsing in the fields beyond. It was a pleasant picture of rural life.

Another mile brought us to a large plantation of umbrageous stone pines and dark cypress trees, belonging to the Prince Borghese. An old castellated farm-house stood on the edge of these thick woods, but there were no signs of inhabitants; on the contrary, its blackened walls and tall, dismal towers were suggestive alone of those domains which romance loves to picture with ghosts, and to make "night hideous" with mysterious echoes. Passing a fine fountain whose large basin might water "the cattle upon a thousand hills," the road commenced gradually to ascend; and very soon, in contrast to the sterile waste through which we had thus far bowled along, we were met with luxuriant vineyards, and the soft, silvery green of the olive orchards.

It was the season of the vintage, when October, crowned with vines, walks with ruddy feet through the sunny lands of Italy; and as we passed up the hill, patient little donkeys, laden with large buckets of the luscious grapes, trotted past us on their way to Frescati, where the finest wine of the country is made; or others, with empty baskets and buckets, came jogging down to the music of little bells; while in the vineyards, among the mottled vines, lads and lasses in gay peasant costume, were gathering the grapes from the trellised branches.

Every moment enhanced the loveliness of the landscape, as we continued the ascent, not without several times stopping our vehicle at certain points, to admire anew the extended panorama.

THE BOIS DE BOULOGNE.

THE fine view which we give herewith, of a scene in the Bois de Boulogne, Paris, calls attention to that great wood and park of 2,000 acres. Until 1852 it was a forest, when NAPOLEON III. determined to transform it into a park, like those he had seen in England, or like the Central Park in New York. With the aid of the city of Paris, he dug out the lakes and made the waterfalls. Before the Prussian war, half the park was wood, a quarter grass, one-eighth roads, and seventy acres of water. There are two pieces of ornamental water in the park, with islands, cascades, rustic houses, etc. Our illustration represents one of these. Very creditable pains has been taken to make the vegetation about the artificial water diversified in character, so that at one place you meet conifers, at another rock shrubs, in another magnolias, and so on, without an eternal repetition of common things.

The islands, seen from the margin of the lakes, are at all times beautiful, in consequence of the presence of a varied collection of the finest shrubs and trees, tastefully disposed. They show at a glance the immense superiority of permanent embellishment over fleeting annual display. The planting of these islands was expensive at first, and required a good knowledge of trees and shrubs, besides a large amount of taste in the designer; but it is so done that were the hand of man to be removed from them for half a century, they would not suffer in the least.

THE true traveler is always calm, observing and "level-headed."

Our Story-Teller.

BEFORE AND AFTER.

A THRILLING ROMANCE OF THE WAR FOR THE UNION.

Written Expressly for Moore's Rural New-Yorker, BY TWO WELL-KNOWN AUTHORS.

[Continued from page 151.]

IX.—In the Conflict.

FOUR years of bloodshed and misery, during which awful period MARGARET had assumed the whole responsibility of the family, comforting, as best she could, her peevish and unreasonable mother—attending to all the details of the strangely altered domestic economy—never once since the departure of her lover having outwardly given up to grief or gloomy forebodings. *That* struggle decided the future, and she realized that to do her duty by those weaker than herself she must put aside her own heart-sickness—in other words, lock the door of the inner sanctuary, and throw away the key. This MARGARET literally accomplished, and the result was all that could be desired. The news of the death of her brother GEORGE, killed in the battle of Gettysburgh, she seemed entirely prepared for. Not so Mrs. HEATHERSTONE. GEORGE was her pet, her idol, and the house was filled with her lamentations, day after day, and week after week. This was peculiarly trying, but MARGARET stood up under it with the same patience and fortitude that had supported her in all previous trials.

Slave after slave ran away and joined the Northern army, while others were forced into the Rebel service as servants. The field hands at the HEATHERSTONE plantation finally dwindled down to two or three, while HANNIBAL, JAKE and SUSAN only remained as house servants. The beautiful land ran to waste and weeds, and MARGARET realized that all hope of the future restoration of her beloved home must be given up. Mr. BRAYTON remained several months, assisting in the settlement of the estate, and endeavoring to procure the freedom of SUSAN—but all to no purpose. The rebellion had so complicated affairs that it was next to impossible to dispose of anything legally, and this noble-hearted friend was finally compelled to leave for active service. This was a blow he did not expect, and came upon the little family with almost crushing force. The delicate state of Mr. BRAYTON'S health had been his excuse for not joining the army, since in these terrible times a good excuse was necessary! But this, they all realized, had very little to do with his lingering at the HEATHERSTONE mansion. Mr. BRAYTON'S sympathies, strange as it may appear, were entirely with the North, and the idea of fighting for the preservation of an institution he despised, was of all things most revolting. But the time came when apparent obedience must be rendered—and then were our friends indeed alone.

"I could bear all the rest, SUSAN," he said to the octoroon, as he bade her good-by, "if I had only been able to accomplish your freedom; but to know that I must leave you a slave is more than I can bear." And the man's cheeks were wet with tears.

"Do not grieve about that, dear master," replied SUSAN, in that strangely weird and mellifluous monotone she always used when under strong excitement. "Those shackles will be removed by the law of the land before many months; but a slave I shall always be, notwithstanding."

"Why, child, what do you mean?" inquired BRAYTON, with great earnestness.

"I can never be a free woman, my dear master. Do you not know the reason? Because I haven't even the dignity of one color to support me. I am neither black nor white. What comfort can there be in the world for me under such circumstances, I should like to know?"

"This comfort," replied Mr. BRAYTON, with great feeling. "The comfort of knowing, whatever your surroundings—whatever your color—that you are GOD'S child; a child, too, unusually endowed and exceptionally loved."

"Loved—loved?" whispered SUSAN.

"Yes, loved," answered her companion. "Loved by our SAVIOUR, and by all those who know you. But I must go now. Good-by, and GOD bless you!"

The strange man was gone, and poor SUSAN, conscious of having parted with the dearest friend she possessed on earth, fled to the solitude of her room, and on her knees begged for strength and mercy.

"And yet," she moaned, "I allowed him to depart without saying one word to him on the subject that worries me most. But why should it worry me? Even if established in the truth of my suspicions, what good will it do me? How will it avail anything? Suppose I could prove myself Col. HEATHERSTONE'S half-sister — what then? Would it make me a free woman? Oh, if I had only asked him; but now I see the end. We shall all be refugees—poor wanderers on the face of the earth—homeless, penniless, forsaken! What a fool I am. The avowal

of such a relationship would only add another disgrace to my life. I must keep still. Oh, Father in heaven, if I could only die!"

HANNIBAL, always resolute, seemed to grow more cool and daring, as he realized the responsibility of his position. Through these long, weary months of privation, MARGARET had only HANNIBAL to consult—only HANNIBAL to confide in. His tact and good nature prevented many a scene of bloodshed in the very door yard. As long as the poultry lasted, HANNIBAL helped the marauders kill and eat it—submitted to seeing the best cattle on the place driven away to the camp of the Yankees. When asked to accompany the soldiers to camp, his answer invariably was—

"No, tank ye, honeys. Dis nigger be in possession ob a bery brack skin, he know jus as well as de best ob ye; but dar be helpless women in dat house dat HANNIBAL lub wid his whole heart, and if he eber go back on 'em, may de good LORD stop his wind in a hurry."

These sentiments—it mattered little what kind of a crowd he was the center of—always brought down the house; and many times, such was the effect of the old negro's unselfishness, that the more generous of the soldiers would often leave the grounds without removing an article, or an atom of food. Finally, our little family found themselves quartered in three rooms of their once beautiful mansion, while the rest of the house was used as a hospital by the Confederacy. There was no help for it, and MARGARET submitted to this as she had to the rest. News was constantly arriving in regard to the welfare of her lover, but for several months not a line or message had been received from her brother, ALFRED; and when, at last, the long, weary war drew near its end, his friends were totally ignorant of his fate.

The winter of 1864 and '65 passed slowly and drearily. The power of the South was being gradually broken in its last strongholds. SHERMAN, THOMAS, and KILPATRICK were fighting their last battles in Georgia and the Carolinas, and GRANT was gradually tightening the cords that finally strangled LEE and his conquered army.

On one of the last days of March, while the terrible fighting was going on that resulted in the evacuation of Petersburg and Richmond, a young Northern soldier was brought to the HEATHERSTONE house in a helpless condition.

"Couldn't de young Missus come down and see he?" said HANNIBAL to MARGARET, a few hours after the wounded man had been received. "He be only a boy, and so tender and gentle dat ole HANNIBAL almost 'fraid to touch him wid his big brack hands."

"Send SUSAN, MAGGIE," said Mrs. HEATHERSTONE, from her sofa; I don't like to have you among those wounded men. I worry every moment while you are gone. A child's first duty is to its mother, I think. What have those Yankees done for you that you should nurse them? You want to reward them for killing your brother, perhaps. O, my poor boy—my darling GEORGE!" And the miserable mother began to weep hysterically, and to complain that nobody was left who had any regard for her feelings. SUSAN was called to soothe her, and MAGGIE followed HANNIBAL to what had once been the family parlor, now filled with straw pallets, each of which was occupied by a sick or wounded soldier.

"Here, Miss MAGGIE," said the servant, "dis way, if you please."

When MAGGIE found herself before the wounded boy—for he seemed only a boy—she was thrilled with a strange sensation. What was there in the fair hair and in the corners of the womanish mouth that so stirred up old memories?

"Bring me a chair, HANNIBAL; I will sit by this poor boy awhile," said she. "Did you get no clue to his name or home?"

"No, missus; HANNIBAL done got no clue whatever. He bin delirious eber since we pick he up. De men dat find him tink he discharged from de hospital, and he try to find his way home and done gib out. De war so near ober now, Miss MAGGIE, dat de formals 'spensed wid, mostly, HANNIBAL 'spects."

The sick man turned restlessly on his narrow couch, muttering unintelligibly. At last his words became more distinct.

"Dat be a name he say ober and ober, Miss MAGGIE."

MAGGIE listened intently, but she did not need to listen long, for in a moment the word "ALFRED" was spoken clearly, but in a mournful tone, that made her shiver and turn pale.

"ALFRED, ALFRED! I didn't mean to lose sight of you," continued the sorrowful voice. "I promised HOPE I'd always keep—keep—O, there they are now, ALFRED and HOPE; how they love each other!" And the delirious words were changed to a low laugh, more pathetic than a sob.

"O, HANNIBAL, it's HOPE'S brother NED," said MAGGIE, throwing her arms around the faithful old servant's neck, and crying as if her heart would break.

"HANNIBAL done sure ob dat; but why does de little Missus cry? HANNIBAL say, de bressed LORD be praised for bringin' de boy here."

It was, indeed, NED ARNOLD, stranded by the tide of war upon a friendly shore. He had been wounded at the battle of Cedar Creek, Va., the previous October, had been transferred to a Richmond hospital late in the winter, and upon his discharge from the hospital, had attempted to look up the HEATHERSTONES, and had fainted on the way.

FROM NED, MARGARET heard of the wreck of the ARNOLDS, both in family and estate. The eldest brother joined the army about the middle of the war, and was instantly killed at the battle of Murfreesboro. Mr. ARNOLD died of fever the summer following his son's death; the business was so extended, and the Southern bankruptcy was so great, that the sudden death of the head of the firm, and the lack of a competent manager in his place, could have but one result—utter ruin. HOPE had left New York and gone East to teach, and NED had not heard from her in over three months. The one question constantly in the hearts of all was, "Where is ALFRED?" Mrs. HEATHERSTONE asked it of the sick boy, in her querulous tones, and NED and MARGARET talked of all the possibilities, over and over, in the dull hours of convalescence. HOPE was informed of NED'S safe asylum and the tender care of MARGARET, and so the days sped on till Richmond was evacuated, and LEE had given up the sword of the rebellion. JOHNSTON'S surrender to SHERMAN on the same unconditional terms, followed, and the war was over. The victory of the North added not a little to the rapid recovery of NED ARNOLD. On the day that the family heard of the surrender of JOHNSTON'S army, NED said to MARGARET:

"You must get your mother's consent to go North; the South is no place for you now. We will all go to New York—HANNIBAL and SUSAN, inclusive—and then we will have HOPE back, and all live together. We shall hear from Alfred, be sure of that;" and the enthusiastic boy saw, with the eye of faith, the scattered fragments of the two families joined in New York, and almost happy again.

"I think mamma will be glad to go anywhere to get away from the scenes that remind her so strongly of all that she has lost. But we must wait till HARRY comes home, and see what he says. You have never seen HARRY? Poor fellow, he has had some hard times since he left us. We have all suffered so much since then—so much!" "Poor HOPE is HOPE no longer, I fear. She must be sadly changed."

"Not so much, if I may judge from her letters, as you suppose. HOPE has an indomitable spirit. Her name is expressive of her character."

"What do you want, HANNIBAL?" said MAGGIE to her old negro, who had just come in, and stood humbly waiting an opportunity to speak.

"Massa BRAYTON done arrive five minutes ago. He, with SUSAN, now in de libry, and he send HANNIBAL to fotch Miss MARGRET." [To be continued.

EARTH NOT OUR HOME.

I CANNOT believe that this earth is man's abiding-place. It cannot be that our life, cast up by the ocean of eternity, is to float a moment upon the waves and sink into nothingness. Else why is it that the glorious aspirations, which, like angels, peep from the temple of our hearts, are forever wandering about unsatisfied? Why is it that the stars which hold their festival around the midnight throne, are forever mocking us with their unapproachable glory? And, finally, why is it bright forms of human beauty are presented to our view, and then taken from us, leaving the thousand streams of our affections to flow back in Alpine torrents upon our hearts? We are born for a higher destiny than that of earth. There is a realm where the rainbow never fades; where the stars will be spread before us like islands that slumber on the ocean; and where the beings that pass before us, like shadows, leave our presence forever.—*Bulwer.*

EVERY word spoken from affection leaves an everlasting impression on the mind, and every thought spoken from affection becomes a living creature, and the same also if not spoken, if it be fully assented to by the mind.

Social Topics.

SIR HENRY SIDNEY'S ADVICE TO HIS SON AT SCHOOL.

"SINCE this is my first letter that ever I did write to you, I will not that it be empty of some advices which my natural care of you provoketh me to wish you to follow. Let your first action be the lifting up your mind to Almighty God by hearty prayer; and feelingly digest the words you speak in prayer with continued meditation of Him to whom you pray, and of the matter for which you pray. And do this at an ordinary hour, whereby the time itself will put you in remembrance to do that which you are accustomed to do at that time. Be humble and obedient to your master; for unless you frame yourself to obey others, and feel in your own self what obedience is, you shall never be able to teach others to obey you. Be courteous and affable to all men, with diversity of reverence according to the dignity of the person. There is nothing that winneth so much, with so little cost. Use moderate diet, so as after your meat you may find your wit fresher and not duller, your body more lively, and not more heavy than before. Give yourself to be merry, for you degenerate from your father if you find not yourself most able to do anything when you be most merry. But let your mirth be ever void of all scurrility and biting words to any man, for a wound given by a word is often harder to be healed than that which is given by a sword. Be rather a hearer, and bearer away of other men's talk, than a beginner and procurer of speech. If you hear a wise sentence or an apt phrase, commit it to your memory. Let never oath be heard to come out of your mouth, nor word of ribaldry; detest it in others, so shall custom make to yourself a law against it. Be modest in every assembly, and rather be rebuked by light fellows for maidenly shamefastness than by your sad friends for pert boldness. Above all things tell no untruth. No, not even in trifles. Study and endeavor to be virtuously occupied. So shall you form such a habit of well doing, that you shall not know how to do evil. Remember, my son, the noble blood you are descended of by the mother's side, and think that only by virtuous life and good action, you may be an ornament to that illustrious family."

His mother was Mary, eldest daughter of the Duke of Northumberland. At the time of Philip's birth, she was mourning the death, on the block, of her father, her brother Robert, and his wife, the Lady Jane Grey. To the letter of Sir Henry Sidney a postscript was added by this excellent woman: "Your noble and careful father hath taken pains, with his own hand, to give you in this his letter, so wise, so learned, and most requisite precepts for you to follow with a diligent and humble, thankful mind, as I will not withdraw your eyes from beholding and reverently honoring the same. I first bless you with my desire to God to plant you in his grace; and, secondly, warn you to have always before the eyes of your mind these excellent counsels of my lord, your dear father, and that you fail not continually once in four or five days to read them over."

WATER IN THE HOUSE.—Let nobody be deterred from bringing water into his house by any fears of failure and perplexity. You might just as well stop the circulation of blood in the body because it is subject to derangement, as to refuse the circulation of water in the house because, now and then, a pipe overflows, and your frescoes are ruined. Good workmen will prevent any such accident, but if they cannot, give up your frescoes; do not give up your life blood. When I see the farm-houses, the dairies, the kitchens, whose only source of supply is the well in the yard, or the hogshead at the back door, and think how life would be lengthened and sweetened if all this heavy, and hard and slow water-bringing could be supplanted by the turn of a screw, I wonder that we do not manage to introduce it, somehow, into our marriage contracts. What an increase of vital force would ensue; what a diminished demand for divorce; what a strengthening and up-building of the family bond, if a girl should refuse to marry until there was an inexhaustible supply of water, at least in the kitchen. A house without water-works ought to be considered as incomplete as a house without doors, and as incomplete in the country as in the city.—*Gail Hamilton.*

A RADIANT, sunny spirit extracts happiness from every incident of life, and which all the gold of California cannot bestow. Think of that, poor millionaire!

Sabbath Reading.

PRAY.

OUR prayers and GOD'S mercy are like two buckets in a well; while the one ascends the other descends. —*Bishop Hopkins.*

PRAY to thy Father, trusting child,
Thy Father dear above,
And while the prayer of faith ascends,
Descending see His love.

Pray to thy Father, erring child,
Thy Father dear in Heaven,
And, even while thy prayer ascends,
Thy sins are all forgiven.

Pray to thy Father, tempted child,
With faith in JESUS' name,
CHRIST knows what sore temptations mean,
For He has felt the same.

Pray to the SAVIOUR, sorrowing child,
Our sorrows He can feel,
And even while thy prayer ascends,
Descends the balm to heal.

Pray to thy SAVIOUR, mourning child,
Thy SAVIOUR dear on high,
He who on earth for LAZARUS wept,
For thee feels sympathy.

Not willingly doth He afflict
His children journeying here,
But with the rod His blessing sends,
Till we to Heaven draw near.

Firmly and strong the rope unites
The buckets of the well,
But stronger is the chord to raise
Our prayers while here we dwell.

And ever sure the cord that brings
Us mercy from above;
"Ask and receive," thou favored child,
And praise the GOD of love. E. P. D.

CONTENTMENT.

"CONTENTMENT comes not, therefore; still there lies an outer distance when the first is hailed." Who hath found it? Who hath not searched for it? But it is ever just a little way beyond,—a goal that is never reached, but always hoped for and strived after. Can it be there is no satisfying the human heart with other than Infinite love? And how few reach that state of perfection, and obtain that panacea for all ills, that the heart shall be so filled with this love and beautiful faith that nothing worldly can produce despair! And yet there are those who live this life, to whom sorrow has come, and all the joy of their own lives seem gone to them forever, save in the blessed assurance that soon they, too, shall "cross the vast, calm river," and till that time its breadth and depth are bridged over by the thoughts of the loved from the other side; the beautiful faith that angel forms surround. Angel hands caress the dear ones here, sustain them, and even though the sun has ceased to shine for them on this side, shall it not break upon them in all its glory in the great Hereafter? Shall not the "well done" which will welcome them home be a recompense for their cheerful endurance?

But of those who are blessed with all that can bring peace and contentment here, and still are searching a little way beyond for the "pearl of great price;" who fail to enjoy the present in looking forward for great things in the future; think you success will ever crown their efforts, and contentment settle down upon their hearts and leave them nothing more to desire, and the remainder of their days be spent in joy and perfect satisfaction. 'Tis rarely such find a happy life here, who strive after that which may bring contentment merely for the satisfying of the heart. But rather he who resolves to be content with the life GOD has given him to live, rests under His hand, receiving pleasure and pain alike as sent of Him. The lover thinks contentment shall come to him when she whom he has chosen to wear his heart and bear his name shall be all his own; but trials, cares, and vexations, all unlooked for, arise, and still he must look forward in the dim, shadowy future for that glad time when he shall find perfect rest.

With what hopes and aspirations, and trusting, child-like faith that contentment is just within their reach, doth many don the bridal veil. She gives her warm, pure heart, her precious life, into the keeping of one who, in the years to come, will bring to her the sweet and bitter of life; and a trusting heart must accept the glass, and drink therefrom whatever his choice, or circumstances, may fill it with; and many a poor, disappointed heart has found it bitter, bitter indeed, and murmured not. While another may have gathered all the sweet earth holds for them, there needs must creep some bitterness therein, even though tenderly offered by loved ones who suffer more in seeing those dear to them bear all they must, than to hold to their own lips the bitter cup and drink to the very dregs. While this cannot lessen the pain and agony endured, it can bear one up—can cheer as only those poor, broken-hearted ones can tell, to whom sympathy has been denied, and to whom contentment seems something of the past, which shall never come again till the final rest.

Search where you may, weary wanderer, you will never find contentment elsewhere than in the heart that strives to be content with what it has, nor in the vain reaching for more, lose all,—even the life which now is, and the life which is to come.

ELLASJOE.

Ladies' Port-Folio.

ALONGSHORE.

BY ANNIE HERBERT.

DRIFTING with quiet oar
In an eddy cool and sweet,
With restful peace from the billows' roar,
And rest for the tired feet;
Hands that are willing, but weak, to fill
The work of the busy brain,
Heart that will shield its treasure still
From the crucible of pain,
While the river's song is a lullaby
To the lilies on its breast,
And, clinging closer, their lips reply
With passionate languor,
"Rest."

Only to think and feel,
And sigh for the bliss—to do;
To smile when the swaying vines reveal
The sunshine filtering through;
To dream, when swallows are trooping back,
And the robins build and sing,
Of birds that wait on the southward track,
With weary and wounded wing;
To waken under the sunny blue,
With the loves I love the best,
And lips of blessing, forever true,
That tenderly murmur,
"Rest."

To feel quick pulses jar
To the city's outmost rim,
And long for violets growing far
In the hush of the woodlands dim;
To know the West is aglow with gold,
And the orient gates of pearl
Swing wide, till the day grows on and old,
And the evening billows curl,
While the oarsmen sing, "Your work shall speed
In prayers for the souls oppressed;
Each midnight hideth its golden meed,
And the morning cometh,—
Rest."

What of all I had planned?
What of my anxious thought?
Held firm in the sweep of a mightier Hand
That turneth our toil to naught,
And gleaneth the threads of our tangled maze,
That the angels weave complete
In flowers, that border the perfumed ways
Of the Paradise gardens sweet,
So drifting out from the toiling throng,
And nearer my Father's breast,
The far off sound of their clarion song
Is a dreamy echo,—
"Rest."

The quiet that folds me round
May strengthen my soul for strife,
Or break, in ripples of silvery sound,
On the beautiful banks of Life,
When the little things that our hands have done,
And the great deeds, only planned,
The wish and fruition shall be as one,
In the light of the Morning Land;
And, even drifting with broken oars,
Our Father's will is best,
He holds the eddies along the shores,
And His angels whisper,
"Rest."

LESSONS AT THE WASH-TUB.

BY LETTIE.

"OH, dear! I wish Dr. HOLDER had never gone to Europe," said ELLA WILSON to her elder sister, as she took her place early one Monday morning at the wash-tub.

"Why, what difference does that make to you, ELLA? It certainly improved his health very much, and his manners too, I think."

"That may be; but he has put such ideas in mother's head. Instead of recommending for me to ride horseback, or play croquet, or any exercise that is fashionable, to regain my strength, he has made her believe that standing at this wash tub will do more for me than anything else. I heard him explaining to her the effect of the warm suds on the nervous system, and with what wonderful success it had been tried on several patients he visited in Europe. Just look at my red hands! What will HARRY say, if he calls this evening?"

"If he is a sensible young man, he will not think less of you for that. Red hands are no disgrace, and if the color comes back to your cheeks in consequence, you will gain more than you lose."

"NELL, one thing I *know*, if I conclude to accept him, and become his wife, he will not wish me to labor in this way."

ELLA was right in her conclusions; for when HARRY called that evening, and she promised to be his forever, he told her (as he noticed her hands were not as white as formerly) she should never have to put them in the wash tub after she became his wife.

HARRY BELDEN was a young man of considerable business capacity, living just for the present, making money and spending it as he went, without any thoughts of the higher ends (?) and nobler purposes of life. In selecting a companion he had looked for one who could make a show in the world, and gratify his selfish pride, and thought he had found the one he sought in ELLA WILSON. Hers was a character that might have been moulded into almost any form; naturally gentle and loving, her great lack was *decision*, so that in ten years after their marriage you would hardly have recognized her former self at all, so completely had she conformed to her husband's ideas in everything. They were not quite so prosperous now as they had been, for failing to acknowledge GOD'S hand in their daily mercies, and consuming His blessings wholly upon themselves, they were wanting in that sweet consciousness of heartfelt joy that comes only to those who know how to deny themselves for others' happiness. Five years, and we look at them again; three rooms is the extent of their earthly home, and ELLA is standing at the despised wash-tub, not now murmuring that her hands must be discolored by such healthful toil, but thankful she ever learned so much of labor, that she can aid her husband in his failing health to earn the means for their daily subsistence. Their riches that gratified their pride have vanished, their children, all but two, are in the grave; but she is happier now in that humble home than ever before in her life. She has drank of that fountain of endless joy, and is looking forward to such a glorious home, that all the privations here seem as nothing. I hear her singing now at the wash-tub, and to her husband, who has just come in, weary and worn, she says:—"HARRY, what should I do now if I had not years ago learned those lessons at the wash-tub?"

EDUCATING WOMEN FOR BUSINESS.

FROM S. S. PACKARD, President of Packard's Business College and English Training School, in this city, we have received a lengthy communication, which we are obliged to condense for the want of room, relative to an offer he made more than two years ago, to educate gratuitously fifty women for business. In a letter, the substance of which appeared in the RURAL some time ago, he spoke of the comparative failure of the project, from the fact that so few who applied were prepared to complete the course, and thus make themselves competent as clerks and accountants. As a result of this article, some thirty women, from all parts of the country, have written to Mr. PACKARD, and he now informs them that the main cause why women are not successful in obtaining employment is because they are unable to perform the work required. This fault may not be wholly their own, and begins early in life, owing to the mistaken notions of parents relative to the education of girls. Notwithstanding this, Mr. PACKARD was of the opinion that there were plenty of women in this country who only lacked the opportunity to fit themselves for some useful employment. He felt it was not true that men had combined against women. He found there was no prejudice against women in the business houses of New York; that the general feeling was that they either could not or would not make themselves proficients, so as to occupy a paying position. He therefore made the offer he did, looking only to the ill-paid women of New York city who might possibly find time to attend his college. He had not thought of being misunderstood, and did not propose to take the entire charge and responsibility of tuition, board, and incidental expenses of any number of women who might come to New York. Neither could he guarantee to all such women an adequate education with an assured position. His offer was limited to one year, which expired a year ago; it covered only the matter of tuition; it was not intended to induce young girls of sixteen to leave good homes and advantages to follow an insane ambition in a wicked city; he did not propose to become a philanthropist, but to test a theory that the burden of complaint made by the women of to-day against the men is unfounded. Employers want services, and care little about sex; there is no fatal prejudice against women. Mr. PACKARD thinks that many women who would have been glad to accept of his offer could not do so, as they were unable to support themselves the while.

THE heart is ready enough at feigning excuses for all that it does or imagines of wrong; but ask it to give a reason for any of its beautiful and divine emotions, and it can only look upward and be dumb. When we are in the right we can never reason, but only assert.—*J. R. Lowell.*

IF you cultivate the worship of beauty and truth; if the sanctity of the moral speaks to your heart; if all beauty and all truth bring you back to the hearth of holy life; and, if arrived there you forbear speech, you cover your head, you perfectly confound thought and language in order to say nothing partial in the presence of the infinite, how dare you talk of atheism?—*Renan.*

Reading for the Young.

I KNOW.

BY ANNA CLEAVES.

I KNOW where the violets hide,
For I spied them out to-day;
Little fairy yellow things,
Blooming sweet in GOD'S highway.

I know where the winter-pinks
Scent with perfume all the air;
And where tiny moss-cups grow,
In GOD'S garden, just out there.

I know where the bittersweet
Flaunts her crimson and her gold;
And the catbrier's purple wreath
Clusters in GOD'S hedgerows old.

I know where a little wren
And a sparrow get their food;
For I saw them eat the plums
Of the cedar, in GOD'S wood.

I know where a squirrel gray
Looks and looks and winks at me;
As he peeps from out his den,
Up there in GOD'S great oak tree.

I know where a flock of quail
Settled for a nap last night;
Ah! I saw their footprints plain
'Neath GOD'S snow drifts, pure and white.

O! I know so many things,
And I'm happy all the while;
Happy as the birds and flowers,
For I live in GOD'S sweet smile.

LETTERS TO YOUNG RURALISTS.—II.

FROM COUSIN JOHNNIE.

MY DEAR LITTLE RURALISTS:—I promised to tell you about my funny name, didn't I? And we must always keep our promises, even little ones, you know. Well, you see, the family were all girls; so when I, the youngest and last, came into this beautiful world, and wasn't a boy, either, everybody was very much disappointed. But my aunt, then a young girl full of fun, declared I should be a boy *anyhow*, for she was going to name me JOHN, after my father and grandfather before me. So JOHNNIE I was called, and JOHNNIE I have been ever since. I never signed myself MARY at all until I began to write for the public; and my letters, the most of them, come directed to "Miss *Johnnie* ——!" Sometimes my friends, just for fun, will call me MARY, but I don't realize they are speaking to me, any more than if they said SARAH, or MARIA, and so never think of answering them. I am often asked if I would not like to have people give up calling me JOHNNIE; but I wouldn't for anything. Why, it would be just like giving up a part of myself. I should as soon think of shaving off all my hair, or pulling out all my teeth. I should feel like the little woman who went to market with eggs to sell, fell asleep on the king's highway, and when she awoke, finding how the naughty peddler, STOUT, had cut off her skirts, began to cry, "Laus-a-massy on me, this surely can't be I!"

I am very glad so many of the boys and girls have pets; for if we love and are kind to animals, we shall find it very easy to love and be kind to people. I shall have to tell you, sometime, about a pet chicken I used to have when a little girl. I think FRANK A. B. must have been very industrious to gather so many nuts. I should like to be there to help him read the RURAL these long winter evenings. I liked dear little OLLIE'S letter; it sounded just like a little girl's, and not a bit as if some big brother or sister had "fixed it up," as some of the letters now and then do. If I had room, I should like to say something about all the letters, but I cannot this time. So good-by, dear children.

OUR LETTERS FROM BOYS AND GIRLS.

Blanche R. writes as follows:—I live in Mayville, N. Y., which is a very pleasant place. In summer we can see the steamer Jamestown every day. Perhaps some of the girls and boys remember reading about the explosion of the steamer Chautauqua, which happened not far from here. In the summer a great many people from cities come here, and board through the warm weather, and spend a part of the time on the lake. In the winter there is not much going on, except during court week. I am twelve years old, and go to school regularly, and like to, very much. I would like to ask a question. When was celery first brought in use for the table? And is it the same as the plant commonly called smellage, only cultivated?

Eva M. writes from Williamsburg, Kan.: I think so much of the boys' and girls' letters that you print in the RURAL, that I would like to tell you so. I live with pa and ma, and my two brothers, on a nice prairie, close by a creek which has nice trees along its banks, and deer, rabbits and squirrels have a good hiding place among the trees. Sometimes the Indians come and camp in the woods, and shoot the deer. One time a big, tall Indian came here and camped, and had with him a good many ponies, and his wife and a little boy about as big as I am. The boy came to our house to get some salt; we all tried to please him, so as to hear him talk and see his little tricks and pranks.

I have some nice Black Spanish chickens that I think so much of. One night ma heard one of them squall in the coop; she ran out to see what was the matter. A mink had it by the neck and would not let go. Then ma got a stick and hit the mink and killed it. My little brother skinned it, and has its hide stretched to dry. I am only seven years old, but can help ma set the table, and carry chips and wood.

Alta J. G., of Hamilton, Mo., says:—I thought I would write a piece for the RURAL NEW YORKER. I am a little girl twelve years old. I go to school in the winter and summer. I like to see the little birds, and gather flowers, and work for my mother. My little schoolmates come to see my little sister and I. I like to read and write, play and sing. I love to go to Sunday-school, and sing praises to our Heavenly King. I do not like to see little children play, on the Sabbath day, in the street, but I like to see them in the Sunday-school. I love to walk out in the summer, and hear the sweet murmur of the clear stream as it flows by. I love to read good books and papers.

Ice Cream.—Nellie M. F. of Floyd, N. Y., writes:—I shall be ten years old the 18th of April next. I have never been to school, because it is so far. We have taken your paper for a number of years, and like it very much. I have a nice recipe for ice cream, which I will send you. Take of milk two quarts, sugar, one pound, and six eggs; dissolve the sugar in the milk; beat the eggs to a froth, and add to the whole; strain and bring to a scald, but be careful not to burn it; I put it in a tin pail and placed it in a kettle of boiling water, stirring it constantly; when cool, flavor with Lubin's extract of vanilla, or lemon, then freeze.

From Fillmore Co., Minn., JAMES S. writes:—My Pa takes your valuable paper, the RURAL. I like to read the little pieces, and especially the boys' and girls' pieces. I am a boy of ten years old. This is the first letter I ever wrote. My Pa lives away out here in Minnesota, where he has to haul his wood ten miles. It is very cold weather here now, and I have a span of mares, that Pa don't work, to tend to. I have fifteen head of cattle to take a half a mile to water. They surveyed out one railroad through our land last fall, and a few days ago they surveyed another one through our land, and we don't like it very well.

Gettie E. O. writes from Cape Vincent, N. Y.:—"I like to read the RURAL. Cape Vincent is a very pleasant place (at least I think so). There are between twelve and thirteen hundred inhabitants. It projects into the St. Lawrence River. There are a great many moonlight excursions which go from here down among the Thousand Islands. I go to Kingston twice a week in the summer. I travel a great deal, and mostly alone. I would like to tell you more about our pleasant place.

The Puzzler.

ILLUSTRATED REBUS.—No. 10.

☞ Answer in two weeks.

PUZZLE.—No. 2.

To be arranged in shape of a Diamond:—A consonant, an article, a noted city, a vain terror, a period of life, a vowel.

☞ Answer in two weeks.

CROSS-WORD ENIGMA.—No. 3.

My first is in dog but not in cat,
My second is in cloth but not in mat:
My third is in oil but not in water,
My fourth is in bridle and also in halter.
My whole is in every house.

GEO. HINMAN FULLER.

News of the Week.

GENERAL REVIEW.

At Washington the interest has centered on the French arms debate. Senator Sumner has made another telling speech... The Japanese Embassy has arrived in Washington....The New York charter has passed the Albany Assembly.... Judge Davis of the Supreme Court is the Workingmen's candidate for President. His acceptance is regarded as significant....The trial of Mayor Hall progresses slowly. It took four days to get the Jurors ...The Grand Duke has been handsomely received in Havana... Buffalo Bill has paid a visit to the Metropolis....The Alabama claims excitement is dead... All England has indulged in a thanksgiving over the recovery of the Prince of Wales....There has been a great commotion in Antwerp over Count de Chambord, and he has been obliged to leave that city ...Great floods have taken place in the South of Scotland....An attempt has been made on the life of Queen Victoria.

DOMESTIC NEWS.

New York City and Vicinity.

Judge Barnard has had Granville S. P. Stillman, a lawyer, sent to jail for one day, for a disrespectful remark....Mayor Hall's trial commenced on the 26th. Several days were spent in obtaining a jury ...The trial of the Grand Jury, in connection with the Stokes case, continues....Henry Smith has agreed to pay the depositors of the Bowling Green Savings Bank $50,000....The rent question excites attention. There is a decline in second-rate houses and tenements .. The College of Physicians and Surgeons held its commencement on the 28th... Among the gentlemen at the Aldine banquet on the 23d, at the St. James, were Vice-President Colfax, Bayard Taylor, Whitelaw Reid, John Hay, Mark Twain, Launt Thompson, Dr. Mackenzie, R. H. Stoddard, and many others.

Obituaries.

Vicar-General Coskey, of Baltimore died on the 27th, of pneumonia, aged 64... Pere Gratry, the French theologian, has recently died ....Betsy Williams of Providence recently died, and left two millions of dollars to that city.... Le Grand Lockwood, founder of the house of Lockwood & Co., died in New York on the 24th, aged 51....Abraham Heal, agent of the New York State Prison Association, died on the 26th, in Brooklyn, aged 68.

Miscellaneous News.

A canal from Lake Michigan to the Wabash River is proposed....The Grand Duke with his fleet has arrived at Havana....Trains now move regularly over the Union Pacific Railroad.... Gen. Sherman and party are in Naples....A bill has been introduced into Congress to provide a group of statuary, by Mills, to commemorate the suppression of the Rebellion .. A narrow gauge road from Jersey City to Philadelphia, is talked of ...The Japanese Embassy has paid a visit to Chicago, and gone to Washington.... S. F. Salt & Co. of Louisville, Ky., have purchased nearly all the old whiskies in the United States, for the purpose of a corner .. The Japanese Embassy gave $5,000 to Chicago....The National Sunday School Convention meets at Indianapolis in April ...An iron ship-building association has been formed in St. Louis ..Senator Stewart is dangerously ill at Salt Lake City ....There was a great panic in Berlin over the American "case"....The police of Leipsic have forbidden the workingmen of that city to have anything to do with the International Society ...The Looshais tribes in India are said to have surrendered....The revolution in Mexico is growing more formidable....A severe gale on the Pacific coast has caused much damage ... Frank Moore, Secretary of Legation at Paris, has resigned ...Five shocks of earthquake have been felt at Leghorn, Italy.

Crimes.

John Curtis shot R. D. Creak, on the Bowery, N. Y., on the 27th .... Joseph Brown and Isaac Hammel have been arrested in Philadelphia for murdering Daniel Kramer ...Augustus Hamil, Sergeant of the Poughkeepsie night police, has mysteriously disappeared . Wurtsboro, Sullivan Co., N. Y., is excited over a "trunk mystery," the body of Anna Boyce having been found in a box....Paul Ballitti, a young man of 18, committed suicide on the 28th, in a rail car at Paterson, N. J.

Fires.

The railroad depot at Vineland, N. J., on the 27th....Storehouse of the Harmony Mills, at Cohoes, N. Y., on the 27th; loss $40,000....Stores at Dover Plains, N. Y., on the 26th; loss, $35,000. ...House and barn of Mr. Fessenden, Stamford, Conn., on the 26th; loss, $10,000... The Picker House of Columbian Co., at New Ipswich, N. H., on the 26th; loss, $100,000. Also, houses, barns, and stores; loss, $14,000....House of A. Cummings, Westford, Mass., on the 20th; loss, $8,000 .. The American Iron Works, at Pittsburgh, Pa., on the 24th; loss, $300,000. These were the most extensive in America, and employed 2,500 hands... A bridge near Cambridge, Ind., on the 23d. It was 300 feet long....Shops, houses, etc., at Rutland, Vt., on the 25th; loss, $20,000....Wadding mills in Cranston, R. I., on the 24th; loss, $30,000.

Political.

The debate on the French arms question has continued in the Senate for a week, many speeches having been made on both sides....The Deficiency bill amounts to six millions of dollars... The International Copyright bill is not making much progress....The House Committee has agreed upon a bill for the protection of American commerce.....The Apportionment law is to be amended so as to allow certain States an increase of representation....No reply has yet been sent to Earl Granville's note relative to the Alabama claims....Two bills for ocean telegraphs are before Congress ...Gov. Hoffman has appointed Dr. S. O. Vanderpool Health Officer for New York, in place of Dr. Carmechan... Judge Davis of the U. S. Supreme Court has accepted the nomination for the Presidency, made by the Laboring Men's Convention....The New York Charter has passed the Assembly by 89 to 28....Liberal Republicans of Kansas propose to send delegates to the Cincinnati Convention....The Erie case is up for consideration at Albany, and the affairs of the road are under investigation....Mr. Sumner has made another speech on the French arms matter. The House is investigating the matter.... Over 10,000 citizens of Boston have protested to Congress against putting "God in the Constitution."....Senator Buckingham is well again.

FOREIGN NEWS.

From Great Britain.

The Thanksgiving for the Prince of Wales took place in London on the 27th, and was probably the most magnificent affair of the kind the world ever saw. The route of the procession extended seven miles, and was witnessed by 4,000,000 of people. The Prince and the whole Royal Family went to St. Paul's. The day was observed throughout the Empire....The Cunard steamship Parthia ran into a Spanish steamer and sunk it, and had to put back to Liverpool ....The Queen is going to Germany to visit her daughter .. There has been a riot at Killarney ...It is thought the Gladstone Ministry will be out of power before England again consents to arbitration in the Alabama claims....There have been great floods in the south of Scotland. In Dundee the damage was immense.

From France.

The Pope has asked the French Bishops to support the Count de Chambord for ruler of France. The Count has been spending some time at Antwerp, but his presence in that city causing riots, he went to Dordrecht in the Netherlands . There are a plenty of rumors from France. It is asserted a new alliance is being formed between Germany, Austria and Italy. .. The Germans will accept of France an anticipatory payment of $82,000,000, at a discount of 5 per cent., which saves France $4,000,000.... Three French men of war are cruising in the British Channel to guard against Bonapartists. ..The European powers have protested to France against the passage of a bill taxing raw material ....There has been much excited discussion over the proposition to increase the powers of the Government over the press ....A vessel has capsized at Brest, drowning 22 persons.

Which No. 2100—bearing Trade Mark "Fayette Stratton, Marion, N. J."—manufactured by United States Watch Co., has been carried by me from January, 1868, and has been satisfactory to me in every particular. I had to set but twice since I got it; the record is as good as any watch I know of on the Road.—Walter H. Kirkpatrick, Conductor Pa. C. R. R., March 22, 1869.

Some of our very best dairymen tell us that they complete the whole process of butter making, churning, working and salting, to their entire satisfaction, in the Blanchard Churn, without touching their hands to the butter. We know it can be done.

SPECIAL NOTICES.

RUPTURE CAN BE CURED

without suffering. Elastic Trusses are superseding all others. Before buying Metal Trusses or Supporters, send for a descriptive circular to the Elastic Truss Co., No. 683 Broadway, New York.

A Simple Remedy, but one that has proved very effectual in curing Sore Throats, Hoarseness, Pulmonary Affections and Kidney Complaints, is found in *White Pine Compound*. It is safe even for the youngest in the family.

The Happiest Effect in Coughs, Pulmonary Complaints and Kidney Troubles can be secured by using *White Pine Compound*. There is no better or safer remedy before the public.

THE MARKETS.

MONEY AND TRADE AFFAIRS.

New York, Saturday, March 2, 1872.

Trade has continued active throughout the week. The Importers and Domestic Commission men are busy in the Dry Goods line, and the demand is free for general merchandise, except in tea and coffee, in which there is something of a pause, owing to the bill before Congress to take off the duties. It is probable, however, that this cause will not check the spring trade in these articles materially, as it will be sometime before the question is settled at Washington, and the chances are the duties will be modified rather than repealed. The present duty on coffee is 3 cents the pound, and the duty on tea 15 cents the pound. In July, 1870, Congress fixed these rates in place of 5 cts. and 25 cts. respectively, to take effect Jan. 1, 1871. Whatever alteration is made this year will probably take effect after three or six months notice.

The following are the comparative movements of the City Banks for the past fortnight.

	Feb. 17.	Feb. 24.
Capital	$87,155,500	$87,155,500
Loans	281,911,300	282,486,500
Gold and Greenbacks	65,300,700	62,933,500
Deposits	217,907,200	213,328,200
Circulation	28,149,200	28,143,700

PRICE OF STOCKS AND BONDS.

American Gold	110	N. Y. Central Scrip	92¾
U. S. 5-20's of 1867	111¾	Reading	113
U. S. 6s of 1881	115¾	Rock Island	111¼
U. S. 10-40s, 5 ₰ cts	110¾	N. West	76½
U. S. New Loan	108¾	Do. Preferred	90½
N. Y. Bounty Loan	107	St. Paul	56¾
Tennessees	68¼	Do. Preferred	77½
Virginias, new	56	Lake Shore	91⅜
Missouri Bonds	95½	Ohio and Mississippi	44
U. S. Currency 6s	111	Toledo & Wabash	75
Central Pacifics	102½	Erie	32¾
Union do	91½	Union Pacific Stock	31¾
Western Telegraph	69¾	Adams Express	52½
Pacific Mail	69¾	American Express	69¾
N. Y. Central Stock	97¾	United States Exp's	66¾

Gold is marked ¼ ₰ cent. lower on our present quotations. The Government Stocks are ¼ ₰ cent. lower, in the Railroads the changes are very slight. The Northwest Common is 2 ₰ cent. better, and Wabash 1 ₰ cent. lower. Pacific Mail shares are up 3 ₰ cent., and Adams and American Express Companies 1@1¼ ₰ cent. better.

The Cotton trade is dull and lower, although the receipts continue to fall off, and are now 650,000 bales behind the previous crop.

In Wall Street the markets are comparatively dull this week. Money is close at 7 per cent. per annum, and both Gold and Foreign Exchange are lower, and the Government Stocks ¼ per cent. down. The stock movement shows less fluctuation than for several weeks past, and while the prevailing temper of speculation appears to look for a Spring rise in the Railroads, the bearish element on the Exchange is sufficient to check any decided advance.

The Foreign Trade returns for the port of New York have been made official for seven months of the current fiscal year—July 1, 1871, to Jan. 31, 1872.

	1871-'71. July 1 to Jan. 31.	1870-'71. July 1 to Jan. 31.
Goods markeled	$211,303,208	$179,886,723

Gold and silver expt'd	23,851,286	44,300,068

The political question agitating the London Exchange has quieted down, but there is still an unsettled confidence in regard to the Washington Treaty. The opinion among the opposition in Parliament to the present Government is that the Ministry were out-generaled by the Commissioners last Spring and are now floundering to overcome their blunder.

The Government Stocks and many of the new Railway loans have been adversely influenced by the political excitement referred to, and all American stocks are dull in London, and quiet on the Continent. In view of this depression abroad, which it is hoped will prove but temporary, it is satisfactory to hear that Messrs. Jay Cooke & Co.'s great enterprise, the Northern Pacific, finds continued liberal subscriptions at home. The chief features in the Northern Pacific 7.30 Bonds are the payment of principal and interest in gold—the fact that they are a real estate mortgage and railway bond combined, the railway and over 50,000,000 acres of land being pledged for their payment—their freedom from United States tax, and the comparatively low price at which they are offered, which is par and accrued interest in currency. Many millions of these bonds have been sold for cash and in exchange for other securities, and the demand for them is still active.

PRODUCE AND PROVISIONS.

New York, Friday, March 1, 1872.

Receipts.—The receipts of the principal kinds of produce since our last embrace 37,852 bales of cotton, 526 pkgs. dried fruits, 8,101 bbls. eggs, 63,880 bbls. flour, 121,136 bush. wheat, 515,385 bush. corn, 51,747 bush. oats, 117,324 bush. barley, 20,324 sacks grass seed, 2,057 barrels of beans, 4,725 barrels of corn meal, 5,184 hogs do., 481 bales hops, 11,810 pkgs. pork, 1,156 pkgs. beef, 27,451 pkgs. cut meats, 27,461 pkgs. lard, 1,093 kegs do., 19,893 pkgs. butter, 12,185 pkgs. cheese, — dressed hogs, 4,565 tags peanuts, 714 hhds. tobacco, 3,591 boxes and cases do., 9,225 bbls. whisky, 216 bales wool.

Beeswax. The stock is steadily decreasing under an ordinary call from consumers, and prices are steadily held. Prime Southern will bring 30c.

Beans and Peas.—The market for beans is in a much better position. The arrivals have been unusually light. Mediums have met with a brisk call from consumers, and our outside prices are readily obtained for prime stock. Marrowfats have met with rather more attention, and as the stock shows some reduction steadier prices are current. Kidneys bring our quotations readily. The prices are $2.55@2.60 for prime mediums, $2.30@2.40 for good do., and as low as $1.85 for common; prim marrowfats $2.45@3.05, good do. $2.60@2.85, common do. $2.30@2.50, pea $2.00@2.70, red kidneys good to prime $2@2.25. Canada peas are scarce and firm at $1.30 for poll in bbls., $1.20@2 for green. Southern blackeyed with moderate stocks.

Butter.—There is no discernible variation in quotations:

State dairies, fine, 30@31c.; State dairies, fair to good, 25@28c.; State, half-tubs, good to fine, 32@35c.; State, do., common to fair, 21@28c.; State, firkins, fine yellow, 29@30c.; State Welsh, good dairies, 28@31c.; State do., common to fair, 22@25c; State do., fresh made, 32@33c.; State, fancy select tubs, 34@38c.; Ohio, good, 18@20c.; Ohio, Central and Southern, 14@17c.; Western, choice yellow, 20@21c.; Western, store-packed, 17@18c.; rolls, good West, 18@20c.; rolls, common to fair, 15@16c., grease butter, 9@12c.

Cotton. There has been a very unsettled market, with prices decidedly lower. Foreign advices have been unfavorable, and at the points of shipment prices have been weak.

	Uplands.	Alabama.	N. Orleans.	Texas.
Ordinary	19¾	19⅝	19⅝	20⅛
Good Ordinary	21	21⅜	21⅜	21⅝
Low Middling	21⅞	21⅞	22⅛	22⅜
Middling	22⅝	22⅞	22⅝	23
Good Middling	23⅜	23⅞	23½	23¾

Latest sales, on the basis of low middling, are as follows:—March, 21⅝c.; April, 22⅜c.; May, 22½c.; June, 22⅝c.; July, 22⅝c.

Dried Fruits. There has been a most satisfactory movement in dried apples. About 1,500 bbls. have changed hands, absorbing the best grades in market, and prices are very firm at the advance. Peaches are quiet and unchanged. The report during the week that 1,000 bbls. blackberries had been sold at 14c., proved bogus. There has been a fair business, say 200 bbls., in lots, at 13½c.; the holding price is now 14c. other small fruits without new feature.

Apples—Old State, qrs., 7@8c.; Western, new, 8½@9c.; Southern, new, qrs., 7@8c.; do. fine, sliced, 10@12c.; new State qrs., 9½@10c.; do. sliced, fine, 12½@13½c. Peaches, peeled, new N. C., 17@18½c.; do., do., no., 15@16½c.; do. E. Sh. Va., 15@16½c.; new unpeeled halves, 7½@8c.; do. quarters, 5½@6c. Plums, 25@27c. Cherries, new, ₰ ₰, 29@30c. Blackberries, 13½@14c. Raspberries, 28@29c.

Eggs.—Prices are still high, but there is an unsettled feeling, as receivers expect, from day to day, sufficient stock to break the market. Compared with last year at this time, our arrivals are remarkably light. The demand is decreasing at present prices, but receivers manage to place all that comes to hand, although they are somewhat anxious to prevent accumulations. Sales at 37@38c. for Western, and 38@40c. for State, Pennsylvania and Jersey.

Flour.—The business the past week has been very light. Exporters line no margin. The home trade is not sufficient to give a healthy tone to the market. Supplies also have been larger. No decided changes are made in prices, but buyers have rather the advantage. We quote at $6.10@6.50 for superfine State; $6.80@7.10 for common extra do.; $7.05@7.15 for good to choice do.; $7.20@7.50 for fancy do.; $6.10@6.50 for superfine Michigan, Indiana, Ohio, Iowa, &c.; $6.70@7.00 for extra do.; $6.75@7.00 for choice extra do., including shipping brands of round hoop Ohio at $6.95@7.10, and trade brands of do. at $7.15@7.45; good to choice white wheat extras at $7.00@7.85; Minnesota, fair to very choice extra, at $7.50@8.00; St. Louis at $7.00@7.70 for common to fair extra, and $7.75@9.50 for good to choice. Southern at $7.00@7.75 for extras and $7.80@9.50 for good to choice. Rye at $4.10@5.10 for common to fine. Corn meal at $3.50@3.85 for Western, $3.00@3.80 for Jersey, and $4@4.05 for Brandywine.

Fresh Fruits.—Apples are dull, and not likely to improve while so much unsound stock is pressing upon the market. Cranberries are prime in crates; good lots are scarce. A few lots of re-boiled '71 maple sugar is quoted at 16@20c.

Apples—Old State, qrs., 7@8c.; Western, new, 8½@9c.; Southern, new, qrs., 7@8c.; do. fine, sliced, 10@12c.; new State qrs., 9½@10c.; do. sliced, fine, 12½@13½c. Peaches, peeled, new N. C., 17@18½c.; do., do., no., 15@16½c.; do. E. Sh. Va., 15@16½c.; new unpeeled halves, 7½@8c.; do. quarters, 5½@6c. Plums, 25@27c. Cherries, new, ₰ ₰, 29@30c. Blackberries, 13½@14c. Raspberries, 28@29c.

Eggs.—Prices are still high, but there is an unsettled feeling, as receivers expect, from day to day, sufficient stock to break the market. Compared with last year at this time, our arrivals are remarkably light. The demand is decreasing at present prices, but receivers manage to place all that comes to hand, although they are somewhat anxious to prevent accumulations. Sales at 37@38c. for Western, and 38@40c. for State, Pennsylvania and Jersey.

Flour.—The business the past week has been very light. Exporters line no margin. The home trade is not sufficient to give a healthy tone to the market. Supplies also have been larger. No decided changes are made in prices, but buyers have rather the advantage. We quote at $6.10@6.50 for superfine State; $6.80@7.10 for common extra do.; $7.05@7.15 for good to choice do.; $7.20@7.50 for fancy do.; $6.10@6.50 for superfine Michigan, Indiana, Ohio, Iowa, &c.; $6.70@7.00 for extra do.; $6.75@7.00 for choice extra do., including shipping brands of round hoop Ohio at $6.95@7.10, and trade brands of do. at $7.15@7.45; good to choice white wheat extras at $7.00@7.85; Minnesota, fair to very choice extra, at $7.50@8.00; St. Louis at $7.00@7.70 for common to fair extra, and $7.75@9.50 for good to choice. Southern at $7.00@7.75 for extras and $7.80@9.50 for good to choice. Rye at $4.10@5.10 for common to fine. Corn meal at $3.50@3.85 for Western, $3.00@3.80 for Jersey, and $4@4.05 for Brandywine.

Fresh Fruits.—Apples are dull, and not likely to improve while so much unsound stock is pressing upon the market. Cranberries are prime in crates; good lots are scarce. A few lots of re-boiled '71 maple sugar is quoted at 16@20c.

Apples, good, barrels, $1@1.25; do. selections, $4.50; do. poor, $2.75@3; cranberries, fine, bbl., $9; do. common to fair, $5@7.50; do. crates, fine, $3@3.25; do. do. common, $2@2.50; oranges, La., bbl., $14@15; peanuts, Wilmington, bush., $2@2.20; Virginia, new, $2@2.20; do. common, $1.25@1.50; hickory nuts, $1.75@2; Pecan nuts, ₰ 9@9½c.

Grain.—Wheat has been taken moderately well by shippers, but the market has lacked animation. Spring grades have been offered at a decline of 2@3c., there being a fair supply, while prices of winter have been put up about 2 cts., with moderate offerings. The shipments forward to this market are increasing. No. 2 spring in store, 1.52@1.56; No. 1 spring in store, $1.57@1.58; winter red Western, $1.63@1.70; amber Western, 1.71@1.74; white Western, $1.72@1.80. Prices of corn have declined about 2 cts., the market closing firm at 70½@70¾c. for new Western mixed afloat, and 71c. for high mixed and Western yellow. Oats are firm. Sales at 52@54c. for Western, and 54@56 for white Ohio. Barley is higher, with an increased inquiry from consumers Sales at 83c. for choice two-rowed State; upper lake, $1.08; Canada, $1.12½; Bay Quinte, $1.20.

Hay and Straw.—Shipping hay is quoted at $1.25, retail qualities, $1.35@1.60, the latter price for strictly choice lots. Long rye straw $1.00@1.10; short rye, 85@90c.; oat, 75@85c.; wheat, 50@70c.

Hops.—The position of the market is unchanged. Quotations at this date for five years are appended:

New Yorks, growth 1871, 25@35c.; Eastern do. 1871, 25@30c.; Western do. 1871, 25@30c.; yearlings do. 1870, 10@30c.; olds do. 1869, 10@15c.; old olds do. 1868, 8@12c.; Californians do. 1870, 15@30c.; Californians do. 1869, 8@15c.; Bavarians, 75c.; English, 65c.; Belgians (nominal), 55c.

Poultry and Game.—Dressed poultry it in good demand, being less obstructed by game, which is now dropped and prices are firm. Live poultry is scarce but not higher. Wild ducks are in market.

Turkeys, Western, good, 16@18c., do. poor and frozen, 12@16c.; do. State, 17@18c.; do. Jersey, 20@21c.; Ducks, Western, 15@18c.; do. poor and frozen, 12@16c.; do. State and Jersey, 16@22c.; Geese, Western, 10@12c.; do. poor and frozen, 10@12c.; do. State and Jersey, 14@16c.; Fowls and Chickens—Western good, 15@17c.; do. poor and frozen, 12@14c.; do. State, 16@18c.; do. Bucks Co. and N. J., 18@30c.; capons, 25@28c. Fowls and chickens Live, State and N. J., 16@17c. do. Western, 14@15c; roosters, 10c.; ducks, per pair, 75c.@$1.50. Geese.—Western, $1.75@1.75; do. Canada, $1.75@2; do. Jersey $3@3.50; turkeys, 15@17c.

Game.—Rabbits per pair, 35@45c.; hare do., 40@50c.; canvas backs $2, red head $1.25, mallard $1, widgeon and teal 30@40c.

Provisions.—The market for pork has been without life. The offerings of new are more than equal to the demand, although, comparatively, they are not large. New sold at $14; old, $13.50. New for March and April, $11, and for June, $11.25. New extra prime, $12; Western prime mess, $13.75. Dressed hogs, 5¾c. for Western, and 6¾@6¾c. for city. In kindles there is a good business for export, and prices are strong. Sales at 6¾c. for short rib, in bulk; do. in boxes, 6¾c.; Western long clear, 7¼c.; short clear, 7¾c.; clear bellies, 8@8¼c. Cutmeats—there is a steady, fair business for export and home use, at firm prices. Hams in pickle, 8¾@9¼c.; in salt, 8¼@8c.; shoulders in salt or pickle, 5¾@6c. Smoked meats are steadily held; hams, 11@13½c.; shoulders, 6½@7c., and clear rib, 8@8½c. Lard is offered at lower prices. Sales at 9¼c. for Western steam, 9¾c. for kettle; for March, 9¾c., and for April, 9¾c.; city, 9¾c. for steam. Stearine, 9½@10¼c. for prime. Beef meats with a light demand. Plain Western mess, $8@11; extra do., $11@14; tierce beef, $15@17 for prime mess; $19@21 for India mess. Beef hams are steadily held at $23@26 for Western. Tallow is weak, with fair offerings; sales at 9@9¼c. for prime. Stock of beef in yards, March 1st, 61,312 bbls. and hfs., 8,249 of which were old. Pork, 88,562 bbls., 15,660 of which are old.

Seeds. Clover is coming in less freely, and with a fair demand, prices are strong. Sales at 10@10¼c. for State and Indiana, and 9¾c. for Ohio. Timothy is selling in small lots at $3.62½@3.75.

Tobacco.—The market has more animation. Exporters have been buying Kentucky leaf more freely, at steady prices, while the home trade is working on larger parcels. A few lines of seed leaf have been sold at full prices. Foreign is worked off in jobbing lots.

Hubbard squash, per bbl., $4; marrow, $4. Beets per 100, $1.25. Carrots per 100, $1.50.

Wool.—The features of the market for fleeces are Small stocks and high prices are quoted. Pulled are inquired for. California is lightly dealt in. Foreign are in the seller's favor. Latest sales are at 80@85c. for prime Ohio, 32½c. for medium unwashed, 50@53c. for unwashed, 80@85c. for pulled, 30c. for Texas, 37½@40c. for Bull clip California, 46½@48½c. for Cape, 62½c. for washed foreign.

Whisky.—There is considerable business at lower figures. The arrivals are large; Western, 90c.

COUNTRY CHEESE MARKETS.

Little Falls, N. Y., March 2, 1872.

There is no change to note in the market at Little Falls, for the week ending March 2d. Local dealers begin to talk of new cheese, small lots of which they expect will be brought forward the latter part of the month. The general impression is that the new make will go off at good prices.

We have advices from abroad for the second week in February. Our London correspondent says there is an extremely good demand for cheese at advanced prices, and that stocks are getting very small. American extra fine is now quoted at 68@70s.; fine 67@68s.; good, 58@60s.; seconds, 52@58s. The other descriptions of cheese sell as follows:—English Cheddar, 74@80s.; Wiltshire, double, 66@70s.; Cheshire, medium, 56@62s.; fine, 70@82s.; Scotch, 60@70s. Dutch cheese. Edams, 60@70s.; Goudas, 46@58s.; Derby shape, 50@62s.

In butter, fine Irish, European, and the best of the Canadian only salable. We quote prices as follows: Normandy extra, 146@150s.; Cloonmells, 134s.; Canadian, 70@108s.

The corresponding prices last year in London for butter and cheese were as follows:—Cloonmells butter, 150s.; American cheese, 90s.

The weather in Herkimer, N. Y., during the early part of the week was cold, with high winds.

ROCHESTER, N. Y., Feb. 29.—Wheat market firm at an advance of 3@5c.; red winter, $1.50@1.55; white Michigan, $1.58@1.62, and white Ohio, $1.60@1.72. Barley, 65@66c. for two-rowed; 80c. for four-rowed. Oats selling at 46@47c. Beans, $1.50@2. Dressed hogs, $5@6.50. Wool quoted at 60@70c. Sheep pelts, $5 each for best. Chickens, 17@18c. ₰ ₰. Eggs, 26@30c., with declining tendency. Butter, 24@26c. for best. Apples, $1@1.25; per bush.; dried do., 8c. Potatoes, 50c. Clover seed, $5.75@6. Timothy, $3.25@3.50. Hay, $16@23 per ton.

LIVE STOCK MARKETS.

New York, March 1, 1872.

The effect of the depression in all descriptions of butcher's stock just previous to the closing of last week's report was to check shipments and decrease the receipts at this point. By this means the accumulated offerings were disposed of and a further decline avoided; but the demand for meats has been very moderate, and the week's business has been profitless to all parties, except the commission salesmen. The weather has been favorable enough, the

quality of the supplies was fair, and there was no lack of disposition on the part of buyers to operate if there were any reasonable hope for profits; but there was scarcely any demand for the meat, and the hooks in Washington Market and in the various slaughter-houses were overloaded with beef and mutton that no temptation in the way of reduced prices could induce the retail butchers to purchase. Excused from providing expensive meats by the restraints of the season upon the appetite, prudent housewives substituted eggs and fish for beef and mutton. But the receipts of eggs fell off 1,000 barrels for the week, which, with the increased demand, has carried prices to the high figure of 41 cents per dozen, wholesale, while at retail but two dozen and four can be had for a dollar.

Average, '71...	7,187	88	2,301	25,139	25,177

Beeves.—With a falling off in the receipts of 681 head, and increased cost of the usual substitute for beef during the season of Lent, the strong downward tendency noted at the date of last report, has been checked, and prices are nearly back to the figures of two weeks ago. But there has been no life in the trade, and the market closes dull. The offerings last Monday were 340 cars, or 3,387 beeves—1,863 at Communipaw, 1,387 at 100th St., and 732 at Weehawken. The receipts since Monday have been 1,110 at Communipaw, 441 at 100th St., and 109 at Weehawken; and 38 car loads more are to arrive to-day. The market on Monday was variable, but at no time active. A few extra and fancy steers were sold at 13¾@13¾c., but no considerable number for more than 12½c., and nothing of consequence for less than 10c. There were no transactions on Tuesday and Wednesday, and sales were slow yesterday and to-day at about Monday's prices. Some of the latest sales were 103 light, fairish Illinois steers, 6¼ cwt. average, 10¾@11c.; 100 roughish do., 6½ cwt., 10@10¾c.; 34 fair do., 6¾ cwt., 11c.; 64 smooth do., 7 cwt., 10¾@11c.; 150 do., 7¼ cwt., 11¼c.; 64 smooth do., 7 cwt., 11@12¼c.; 30 fat Ohio steers, 8 cwt., 11¾@12c.; 70 do., 8½ cwt., 11¾@12¼c., and 200 Mo. cattle, 7 cwt., 10¾@11¾c.

The following are the prices at the close of the market:

	This week. Cents.	Last week. Cents.
Choice bullocks, ₹ lb.....12¾ @ 13	12 @ 12¾	
Good to prime.....11¾ @ 12	11 @ 11¾	
Medium .....10¾ @ 11¾	10¾ @ 10¾	
Ordinary.....10 @ 10½	9 @ 10	
Poorest grade..... 8 @ 9	8 @ 8¾	
Average of all sales.....11¼ @ —	11 @ —	

Milch Cows.—Too many cows have been sent in during the last ten days, and there is an unusual number now holding in the stables at West 48th street. The receipts since Monday number 91, and for the week, 205. Prices are down to the lowest figures of the season, and are likely to go still lower. A car load of common cows from Orange county was sold to-day to average $25 per head; other small lots at prices ranging from $30 to $80, and one fancy cow in fine condition for $85.

Veal Calves.—The total for the week is 21 less than for the previous week. Prime milk-fed veals are scarce, and a lot of 25 sold readily to-day at 10@11c. ₹ lb. For coarse meal-fed, and what are called skim-milk calves the demand is light, and 7¾@8¾c. are grudgingly paid for such as are here. Dog-dressed veals are plenty, and are freely offered at 12@14c. ₹ lb for fair to prime lots.

Sheep.—The light receipts for the week—being nearly 12,000 less than for the previous week, and 8,568 less than the weekly average last year—operated favorably upon the market, and the moderate arrivals for the last three days were sold at fair prices; but the consumption of mutton is by no means up to the average mark, and the carcass has to be sold at a low figure—about 8c. ₹ lb. for good. Wool, however, continues firm, though not active, and slaughterers are able to pay comparatively high prices for good sheep. For the last three days the extreme range has been 6¾@9¼c. ₹ lb.—the lowest figure for light-wooled, thin sheep, and the highest for fat grade Merinos. The latest sales, which do not include either very poor or very choice lots, were 214 State sheep, 82 lbs. average, at 8¼c.; 170 do., 83 lbs., at 8¾@8¾c.; 871 common Michigan, 70 lbs. average, at 7c.; 150 coarse Indiana, 106 lbs., at 8¼c.; 653 do., 90 lbs., at 7¾c.; 133 Ohio, 78½ lbs., at 7¾c.; and 329 do., 96 lbs., 9c.

Hogs.—No live hogs have been offered here since last week, as the consignments were exclusively for slaughterers. Nominally, dealers quote at 5@5¼c. for good corn-fed. Dressed hogs have ruled fairly steady, closing at 5¾@5¾c. for Western, and 6¼@6¾c. for city, with a few light pigs sold at 6¾c.

DIED.

FRANKLIN.—At Center Lisle, N. Y., Feb. 21, 1872, HANNAH S., wife of C. R. FRANKLIN, aged 37 years.

THE GREAT WORK FOR DAIRYMEN IS

WILLARD'S

PRACTICAL DAIRY HUSBANDRY!

MR. WILLARD is widely known as the *Best Authority* on all matters pertaining to Milk, Butter and Cheese. **This Great Work** contains about 550 large octavo pages, fully illustrated, and handsomely printed and bound. It tells all that is known to date about MILK AND ITS PRODUCTS, including Butter and Cheese Factories, Dairy Utensils, &c., &c. Price $3. As this book is sold by Subscription, we want an active and reliable Agent in each County throughout the United States and Canada, to whom a liberal commission will be given. Send for Circular, containing terms, &c. To any person residing where we have no Agent, or who cannot wait for one, the Publisher will send a copy, post-paid, on receipt of price, $3, (or for $3 the book and RURAL NEW-YORKER one year.) Address

D. D. T. MOORE, Publisher,
5 Beekman St., New York.

You ask WHY we can sell First Class 7 Octave Pianos for **$290**? We answer—It costs less than $300 to make any $600 Piano sold through Agents, all of whom make 100 per cent. profit. We have no Agents, but ship direct to families at Factory price, and warrant 5 Years. Send for illustrated circular, in which we refer to 300 Bankers, Merchants, &c., using our Pianos in 40 States and Territories.

U. S. Piano Co., 865 Broadway, New York.

WEBSTER'S PATENT BUTTON-HOLE WORKER.

Patented June 27, 1871.

One of the most important inventions of the age! The most perfect Button-Hole Worker ever invented!!

So simple that a child can work a more perfect button-hole with it than the most experienced hand can work without it. Every stitch is taken with the most perfect mechanical accuracy. Is used entirely independent of the sewing machine, and will last a life-time. Does away with pricking the fingers, straining the eyes, and with imperfect and irregular worked button-holes. They give universal satisfaction. Ladies who use them say that they are worth their weight in gold. Over 11,000 sold during the first week of their introduction. The most liberal inducements offered to the trade. Dry Goods and Fancy Goods Merchants, find it an excellent selling article. Local and traveling agents wanted everywhere.

Samples and terms, with full directions for use, sent prepaid on receipt of 50 cents. Orders by mail receive prompt attention. Address

GEO. DAVIS, Successor to
A. W. Webster & Co., 571 Broadway, N. Y.
Please state you saw this in RURAL NEW-YORKER.

ARE YOU GOING TO PAINT?

MORE THAN

100,000 HOUSES

HAVE BEEN PAINTED WITH THE

AVERILL CHEMICAL PAINT

IT IS THE BEST

In the world for exterior work upon Cottages, Villas or Buildings of any kind, whether built of brick, wood or iron. It is a liquid, *ready for use*, and requires no oil thinning or drier. Purest white, and any desired shade can be had in packages from one gallon upwards.

Letter Received from Levi Shaw, Trustee of the United Society of Shakers.

MT. LEBANON, N. Y., Sept. 27, 1871.

RESPECTED FRIENDS:—In reply to your inquiry as to what we think of the Averill Chemical Paint, we have used in our Society at Mount Lebanon some 1,000 gallons. We are very much pleased with it, and until we are convinced that there is something better, shall give it the preference of all other paints. We have used heretofore the (—), (—), and most all other brands of white lead, neither of which have given us perfect satisfaction. Most of it would chalk off after being on some two or three years. This, after three years' experience, we do not find to be the case with the Averill Pure White Chemical Paint. Indeed, it appears just as well as when first put on. I will write you again on the subject when I am not in quite so much of a hurry.

Sample card of beautiful colors, and recommendations from owners of the finest residences in the country, furnished free by the

AVERILL CHEMICAL PAINT CO., 32 Burling Slip, New York, or 118 Superior St., Cleveland, Ohio.

P. S.—The superiority of these Paints has already brought numerous *worthless* imitations in the market. We caution the public against using them.

$500 CHALLENGE

Toward expense of a **Public Test** that the

PATENT LIGHTNING SAWS

Excel in Speed, Ease and Simplicity all others. Of Boynton's Latest Improved Cross-Cut and Wood Saws, not *one* failed in 20,000. Cross Cut ($1 per ft.); Wood Saws ($1 each). *For sale by all Dealers.*

E. M. BOYNTON, 80 Beekman St., N. Y.,
Sole Proprietor and Manufacturer.

A POCKET DICTIONARY

OF THE ENGLISH LANGUAGE.

Abridged from Webster's Quarto, Illustrated with nearly TWO HUNDRED Engravings on Wood.
By Wm. G. Webster and Wm. A. Wheeler.

This volume embraces a careful selection of more than 18,000 of the most important words of the language. The introduction contains, besides the Pictorial Illustrations, Tables of Money, Weight and Measure, Abbreviations, Words, Phrases, Proverbs, &c., from the Greek, the Latin, and the Modern Foreign Languages, Rules for Spelling, &c., &c.; making altogether the most complete and useful pocket companion extant. It is beautifully printed on tinted paper, and bound in three different styles. Tucks, gilt edges, $1. Sent by mail on receipt of the price.

IVISON, BLAKEMAN, TAYLOR & CO.,
PUBLISHERS,
138 & 140 GRAND ST., NEW YORK.

THE NEW BOOK BY T. De WITT TALMAGE, called by the significant title of

THE

Abominations of Modern Society,

Is a startling *expose* of our SOCIAL CURSES and of the PITFALLS FOR THE UNWARY hidden in our midst. It is

A BOLD, BRAVE BOOK!

One to alarm the Young Men and Women of the Land, and to amaze their elders, who have never guessed the true character of the temptations now sapping the very foundations of our Social System. Great as a preacher, Dr. Talmage here proves himself great as an author; and this noble work will render him doubly beloved by the good, and doubly feared by the bad. In one beautiful volume, 12mo. Price, $1.50. Sold by all Booksellers and Newsdealers, or sent, post-paid, to any address, on receipt of price, by ADAMS, VICTOR & CO., Publishers, 98 William St., New York.

MAGIC PHOTOGRAPHS.—The Wonders of the World, 25c. a package. 5 assorted packages for $1. Send to W. C. WEMYSS, 730 Broadway, N. Y.

LOW CASH RATES!

$10,000,000 ASSETS.

Issues policies of Life Insurance on all the ordinary plans at lower rates than other mutual companies and pays annual dividends increasing yearly. The plan called

DEPOSIT INSURANCE,

lately introduced by this Company, is superior to any short term Endowment or Tontine plan, as it fixes a large surrender value for the policy at the end of any of its current years.

☞ Agents in all the principal cities and towns.

The Nursery Favorite Safety Pin.

PATENTED 29th AUGUST, 1871.

BEAUTY, ECONOMY, UTILITY, SAFETY.

THE BEST AND MOST PERFECT PIN EVER MADE.

It Takes 22 Inches of Wire to Construct One Pin.

IT OVERCOMES OBJECTIONS constantly made by those using other pins. Unlike them the wire is formed into a long and short spiral coil. The pin is pointed at the end and is of a triangular shape, which will allow it easily to penetrate one or more thicknesses of cloth. When confined, the sharp point is perfectly inclosed and secure, and cannot become loosened except by hand manipulation

THEY GIVE PERFECT SATISFACTION.

Liberal Inducements offered to the Trade. Local and Traveling Agents wanted everywhere. One-half dozen pins packed in a neat little box and sent post-paid to any address on receipt of FIFTY CENTS.

"FAMILY FAVORITE!"

THE

WEED. WEED.

The most perfect, reliable and generally useful machine in existence. For the family of the farmer or mechanic, when the work required of a sewing machine ranges from the heaviest garments of men's wear to the most delicate and ornamental fabrics for ladies and children, it has proved itself thoroughly efficient and entirely satisfactory. Of unequaled simplicity and compactness of construction, capable of being learned and operated with one-fourth the usual expenditure of time and labor, with a capacity for quantity, quality and variety of execution beyond its competitors, and a reputation for durability and reliability known and appreciated by thousands, it is offered to the people for the most critical inspection and comparison, with confidence that its obvious merits cannot fail to convince the careful examiner of its superiority. Manufactured by the

WEED SEWING MACHINE CO.,
HARTFORD, CONN.

REPRESENTED IN ALL THE PRINCIPAL CITIES AND TOWNS.

CURTIS & COBB, Importers of Seeds, &c., 101 Tremont St., Boston, Mass.

"CORN IS KING."
COOLEY'S EARLY FIELD CORN.

MILLIONS OF BUSHELS OF CORN are lost annually by the early fall frosts; and other millions are not developed, by the failure of the young stalks to push forward before the dry and hot weather of July and August dwarfs their growth.
Mr. C. C. Cooley of Manchester Island, in the Ohio River, during the past twelve years has developed a White Field Corn that is at once VERY PROLIFIC, and
MATURES IN FOURTEEN WEEKS.
Of this corn the New York Herald says:—"The ears of corn received of Mr. Cooley are certainly a novelty. Only think of new corn, raised in Ohio, ripe enough to shell and sell in the New York market *on the 18th of August*."
The New York Tribune says:—"This corn is extraordinary."
The Prairie Farmer says:—"The ears average eleven inches in length. The kernels * * * are matured enough to withstand injury from the frost. As the stalks of this corn are not so tall as those of other varieties, it can be planted nearer together."
FREE DISTRIBUTION OF SEED.
The seed of this very desirable Corn is only this spring first presented to the public. For the purpose of extending its benefits as widely as possible, the publishers of the
CINCINNATI WEEKLY TIMES
Have devised a method of distributing
TEN THOUSAND SACKS FREE,
To the farmers of the North, Northwest, West and Southwest.
For further information address, with stamp,

CARHART'S
PATENT TWO-HORSE
Pulverizing Cultivator
Was Awarded the First Premium at State and County Fairs in 1870 and '71.
It is superior to the best Wheel Cultivator.
The price is only Twenty Dollars.
The draft is reduced nearly one-half.
The depth you wish it to run is regulated without the use of wheels.
It can be drawn close to a tree or plant without injuring it.
It is not disturbed by short undulations of earth, like the Wheel Cultivator, but pulverizes, levels and fits the ground for the Mowing Machine better than any Cultivator in use, and can be used for more purposes than any other implement on the farm.

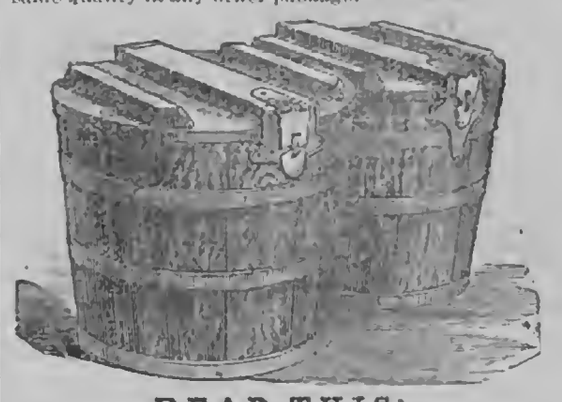
FARMERS, DAIRYMEN AND BUTTER BUYERS!
PACK YOUR BUTTER
IN
WESTCOTT'S
RETURN BUTTER PAIL

Approved and recommended by the leading authorities of our country on dairying, and acknowledged by all butter dealers to be the very best package in use. Butter packed in this Pail brings 5 to 10 cents more a pound in the New York City market than the same quality in any other package.



READ THIS:
NEW YORK, Nov. 15, 1871.
We, the undersigned, Produce Commission Merchants of the City of New York, consider Westcott's Return Butter Pail, manufactured by Silsby Bros., Belmont, N. Y., *the best package in the market*. It is our experience that Butter packed in this Pail *sells more readily and commands a higher price* in this market than in any other package, and we heartily recommends its general use by the dealers, dairymen and butter buyers who ship to this city.
Respectfully,
(Signed by 45 leading Commission Merchants.)

The Westcott Return Butter Pail meets my approval as a good butter package. It is one which I always feel safe in recommending.
X. A. WILLARD,
Dairy Editor Moore's Rural New-Yorker.

Dairymen, send for a Circular! Dealers, send for a Price List! We are the sole manufacturers of **Westcott's Return Butter Pail**, and also manufacture very extensively Butter Firkins, Half-Firkin Tubs, 25-pound Butter Pails, Well Buckets, &c., &c.

LITERARY ITEMS.

WM. MORRIS has finished his new poem, and it will soon be out.

MR. LAWRENCE, the author of "Guy Livingstone," is *en route* to Utah.

CHARLES DICKENS destroyed an immense amount of private correspondence.

DR. LIVINGSTONE is supposed to have fled to the interior of Africa to escape the Herald correspondents.

SUSAN CARLIDGE, author of "The New-Year's Bargain," has received letters of congratulation from Jean Ingelow and Miss Rosetti.

"FOR EVERYBODY" is the title of a beautifully illustrated paper printed in Buffalo. It is almost equal to the famous Aldine of New York.

Wood's Household Magazine for March has articles from Geo. W. Bungay, H. Ganby, Gail Hamilton, James Parton, Dio Lewis, Thos. K. Beecher, M. H. Denison, and others.

OVER thirty-five hundred new books appeared in England last year, besides thirteen hundred new editions—the exact total of both classes being 4,835—and the most notable circumstance in the literary history of the twelvemonth was the decrease in novels from 200, in 1870, to 155, in 1871.

IOWA FARMING LANDS

THE CHICAGO, ROCK ISLAND & PACIFIC RAILROAD COMPANY
Is now offering for sale to actual settlers more than
500,000 ACRES
of the finest and most desirable Farming Lands in the West.

The lands are chiefly situated along the line of its railroad between the cities of Des Moines and Council Bluffs, and are the most fertile and accessible lands offered for sale at low prices in the State. Prices will range from $5 per acre, the average being about $7 or $8.

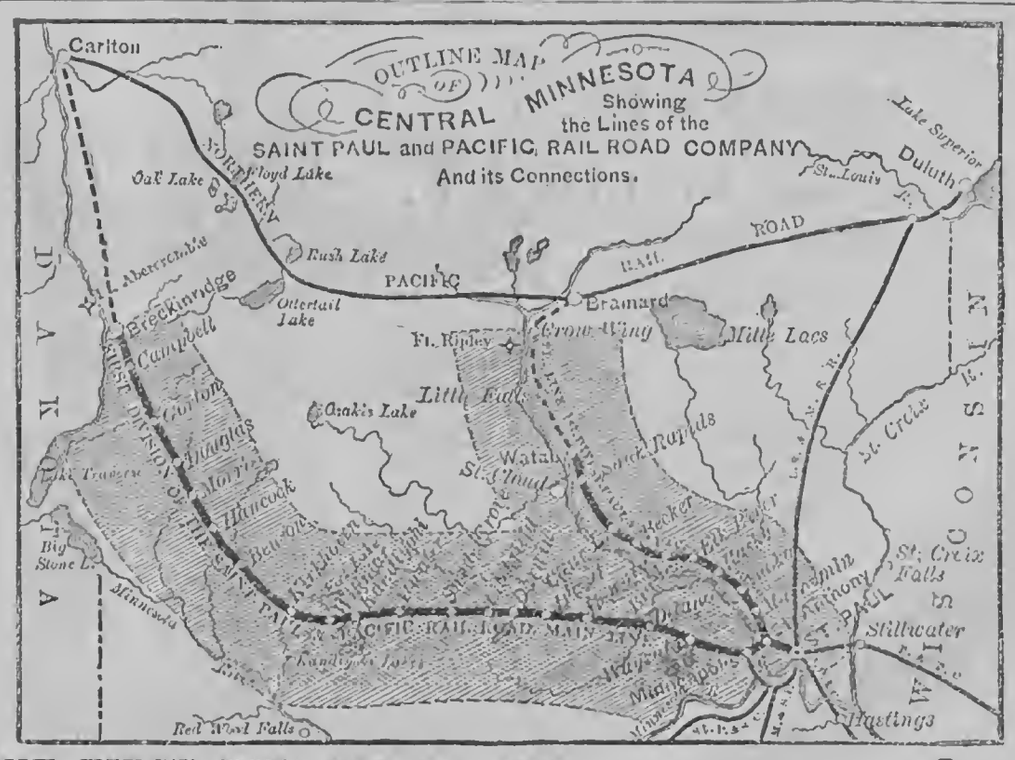
Sales are made either for cash, or on short or long time, so as to suit all purchasers. Full warranty deeds given.

EXPLORING TICKETS,
entitling the purchaser of land to a credit of amount paid for fare upon his land, are for sale at the principal ticket offices of the Company.

For pamphlet (with maps), or any information regarding the lands, address
J. L. DREW, Land Commissioner,
Davenport, Iowa.

NORTH CAROLINA
LAND COMPANY,
(*Chartered by Special Act of the Legislature in* 1869)

Offers for sale 200,000 acres of best Farming Lands, near Railroads, Rivers and Towns, with good houses and improvements. Prices, from $2 to $10 per acre. Also, 300,000 acres of Timbered and Grazing Lands. Prices from 50 cents to $2 per acre. Also, numerous Mineral and Mill Properties, Water Powers, &c., at various prices. The *President* of this Company has been appointed *Commissioner of Emigration* by the Legislature of North Carolina, and by virtue of his office is required to give all needful information to emigrants. No other Company or Agency has the *indorsement* and *sanction* of the State. Apply for information and Circulars.
GEO. LITTLE, President.
WM. SCOTT, Secretary, Raleigh, N. C.



THE FIRST DIVISION OF THE
St. Paul & Pacific Railroad Company
OFFER FOR SALE
1,500,000 Acres of
PRAIRIE, TIMBER & MEADOW LANDS,

At prices ranging from $1 to $12 per acre, for Cash, or on Long Credit, with Interest at Seven per cent per annum. CASH PRICES one dollar per acre less than Credit Prices.

The Bonds of the Company taken at par on Cash Sales. Emigrant houses at the principal Stations free for all emigrants. Applications for land can be made through the Station Agents.

For further particulars and pamphlets, apply to
HERMANN TROTT, Land Commissioner,
General Office at St. Paul, Minnesota.

MEM.—Government lands still to be had, under the Homestead Law, along the main line of the above Railroad.

Miscellaneous Advertisements.

"I fully approve of your Colony plans, and wish you a hearty God-speed."

Vice-President SCHUYLER COLFAX.

"Your plans for a Colony in the fertile Red River Valley are excellent in every feature, and the enterprise has my warm approval."

JAY COOKE.

"Your plans will gather a body of men co-operative in all those elements that Christian civilization demands—temperance, moral character, frugality, skill, etc.

Maj.-Gen. O. O. HOWARD.

THE

Red River Colony!

OF MINNESOTA

offers unequaled attractions and advantages to all who desire to move West. Among them are:

1. Its Temperance Features.

No one can become a member who will not pledge his influence against the sale of intoxicating liquors as a beverage within the limits of the colony.

2. Its Character and Privileges.

Good standing at home, intelligence and frugality are essential to membership. School and Church privileges will be afforded to an unusual extent.

3. Its Location,

which is in the far-famed Red River Valley—often called the *Garden Section*—of Minnesota.

4. Its Climate.

This is unsurpassed in its inspiriting, health-giving qualities. No original cases of ague or consumption ever having been known.

5. Its Two Great Railroads.

The Northern Pacific is now running daily trains through this section to Duluth, bringing it as near Eastern markets as Western Illinois. The St. Paul and Pacific, which will cross the section north and south, is under contract to be completed to the British Possessions this season.

2.—As an unfortunate gust of wind *made* him appear at that particular moment.

BANKING HOUSE OF FISK & HATCH,
No. 5 Nassau Street, New York, February 28, 1872.

WE ARE SELLING THE

Chesapeake and Ohio Railroad

FIRST MORTGAGE SIX PER CENT. GOLD BONDS,

at the rate of 94 and accrued interest. They are in denominations of $1,000, $500 and $100, registered, or with coupons attached; interest payable May and November in United States gold coin; principal payable in 1899, also in gold coin. Bonds delivered by Express, charges paid.

These Bonds, beside being the formal obligations of a well-established, substantial and thoroughly responsible corporation, comprising among its officers and directors some of the most **experienced and trusted capitalists and business men** of the country, are also **secured by a mortgage** lien upon the whole great railroad line, equipment, property and franchises, whose cost and value will not be less than thirty millions, and which is destined, at an early day, to have a productive value of nearly double this sum.

The Chesapeake and Ohio Railroad extends from the deep-water navigation of the Chesapeake Bay to the head of reliable inland navigation on the Ohio River, a distance of 427 miles, of which nearly three-fourths is already in operation, and the remainder under such rapid construction that it will be completed during the ensuing summer.

This line furnishes a **short and remarkably easy route for travel** and transportation between the Great West and the Atlantic coast, and as such will share, on advantageous terms, to a large extent, in the vast volume of through business from the West which now taxes all existing means of transit. By means of connecting lines, now under construction in Ohio and Kentucky, it will afford the shortest and cheapest route between Cincinnati, Louisville, St. Louis, Chicago, Nashville, Memphis and the Far West and the North Atlantic shipping; and it must at once take rank, therefore, as one of the Great Trunk Roads of the country for through transportation.

Besides these advantages it traverses the **Richest and Most Extensive Coal Deposits** in the country, in its route through the KANAWHA VALLEY, and crosses, in its course, some of the most important and **valuable deposits of Iron Ore** known on the Continent. The coal, of which there are three varieties, will furnish an enormous and profitable traffic; and there is no doubt that a large manufacturing activity will soon be developed along the line.

$1,000 bond costs (with the back interest) to-day $959 56.
$500 bond costs (with the back interest) to-day $479 78.
$100 bond costs (with the back interest) to-day $95 96.

We buy and sell GOVERNMENT AND CENTRAL PACIFIC BONDS, and receive them in exchange for CHESAPEAKE AND OHIO BONDS at their current prices. Descriptive pamphlets, with full information, furnished on application.

We receive deposits and allow interest at the rate of four per cent. on balances; make collections in all parts of the country; issue certificates of deposit, and do a general banking business.

A SECURE INVESTMENT.

TO HOLDERS OF UNITED STATES SECURITIES who wish to take advantage of the present opportunity for changing their investment, securing the present premium and increasing their yearly interest income nearly one-third, we strongly recommend

NORTHERN PACIFIC

Seven-Thirties,

principal and interest payable in Gold, now selling at par in currency. These Bonds are secured by a first and only mortgage on the road and its earnings, and all the property of the Company, including 23,000 acres Agricultural, Mineral and Timber Land for EVERY MILE of finished road, or 500 acres for every $1,000 bond. The bonds are in denominations of from $100 to $1,000 coupon, and $100 to $10,000 registered, and, in view of the ample security upon which they are based, we believe no safer investment can be made, nor one yielding a larger income.

Jay Cooke & Co.

AGENTS WANTED FOR

HISTORY OF THE GREAT FIRES

In CHICAGO and the WEST.

By Rev. E. J. GOODSPEED, D. D., of Chicago. The record of a proud city overtaken by sudden and awful calamity, of towns destroyed by the wasting element, of forests burned, of homes and farms desolated, of men of wealth made beggars, of families separated. Abounds with thrilling incidents of marvelous escapes, etc., and is the only complete History of these great events. 600 8vo. pages; 65 Engravings; price $2.50; outfit, $1. Secure the best territory at once. 70,000 already sold. The profits go to relieve the sufferers. Address H. S. GOODSPEED & CO., 37 Park Row, New York, or J. W. Goodspeed, Chicago, St. Louis, Cincinnati, or New Orleans.

THE AUSTRALIAN BUSTARD.

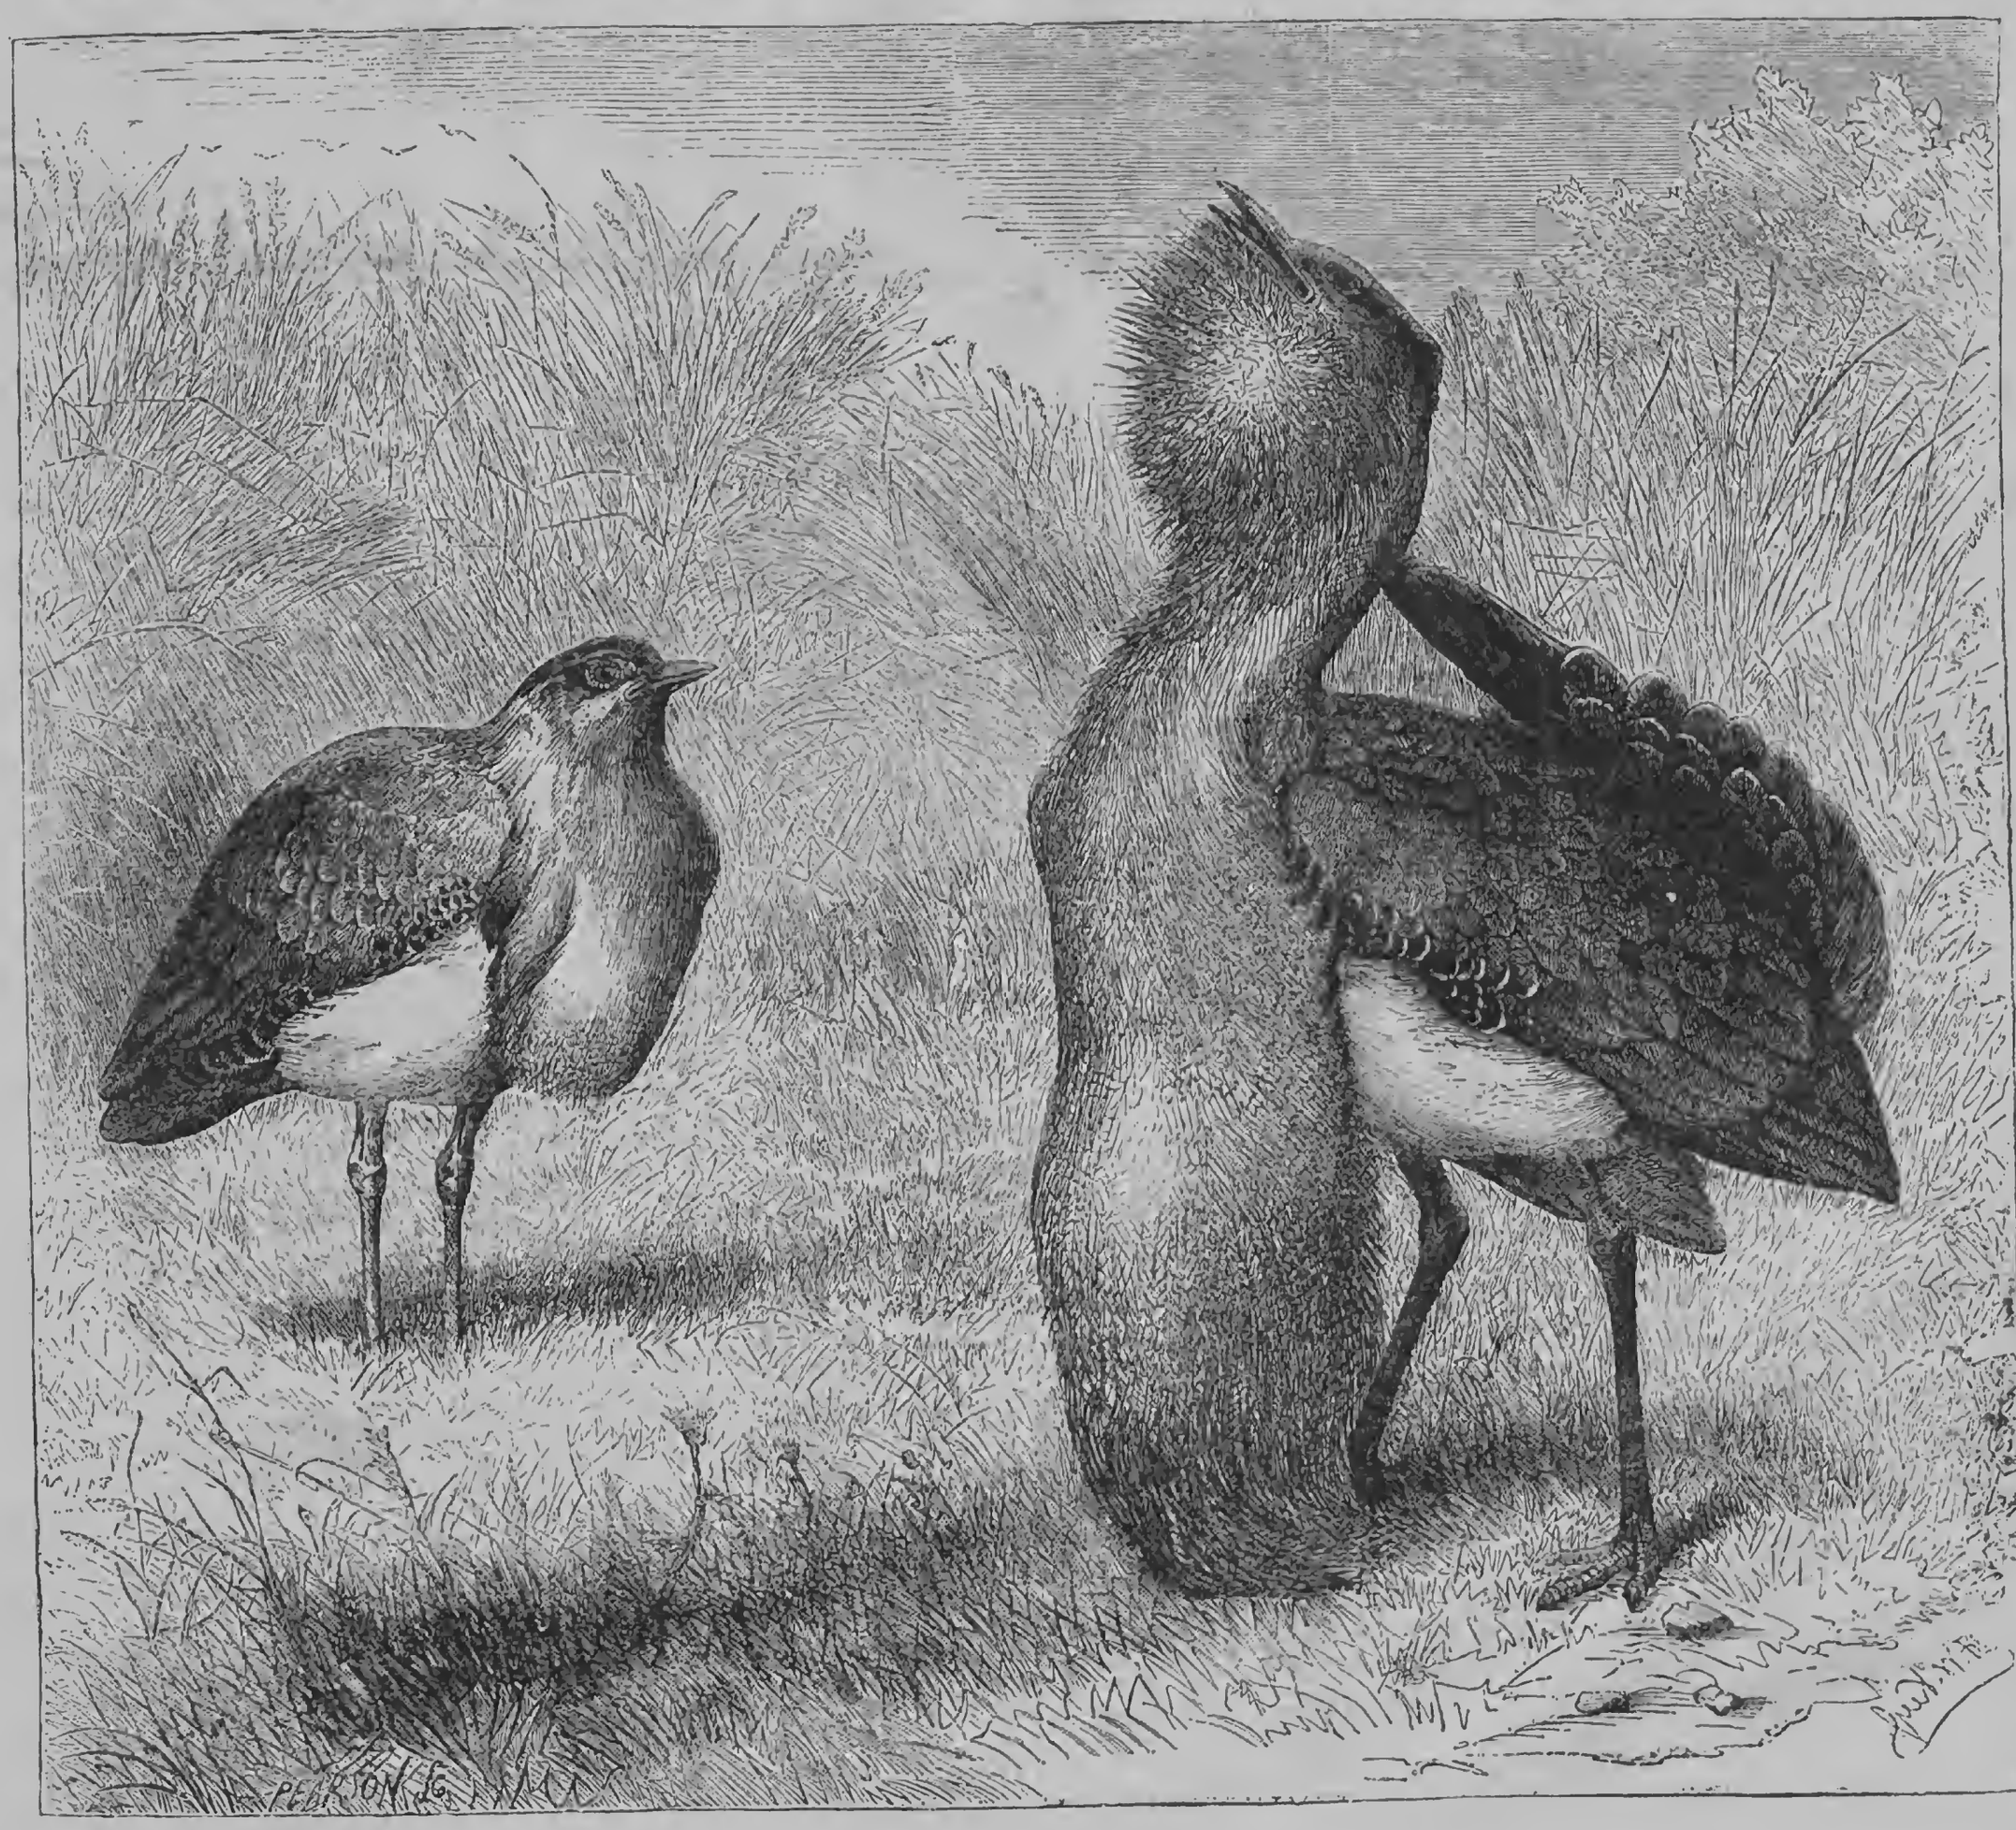
We give, herewith, an illustration of the Australian Bustard, (*Choriotis Australis*) —a curious bird, having long neck and legs, with a moderate bill—the upper mandible of which is slightly arched. They evidently belong to the order *Grallæ* or Waders.

Their wings are short, they fly but seldom, hardly ever using their wings, except like the ostriches, to assist themselves in running. They feed indifferently on grain and herbs, worms and insects. They are very timid, never perch, but fly with precipitation at the least sign of danger. They live on sandy and stony plains far from water. Their eggs are laid in hollow places in open fields, and the young can run about and eat from the moment of their birth. The males differ from the females, as is usually the case with birds, in possessing more ornaments and more variegated plumage. The male, moreover, has a singular pouch-like appendage in the upper part of its neck. This pouch was formerly supposed to be a water reservoir, like the fabled camel's stomach, but Mr. FRANK BUCKLAND asserts that it is a temporary air-chamber, and that it is also closely connected with the reproductive function.

Our illustration represents the Bustard with its pouch inflated, or, as the keeper calls it, "showing off." This occurs during May and June. The neck swells, and the feathers of the lower part descend gradually downwards in the form of a bag, oftentimes nearly reaching the ground. The tail is shot upwards and forwards over the back, coming almost in contact with the neck; in this attitude the bird struts about in a somewhat waddling manner, the elongated pouch swaying to and fro. The display occurs chiefly in the morning or at sundown.

Green Plovers (Peewits) are birds which an Englishman recommends to aid in keeping lawns clear of worms. They are voracious eaters of worms, and should be encouraged, he says, by all lawn-keepers.

Blue Birds and Martins.—Will you, or some of your correspondents, tell me how to prevent blue birds from troubling martins? They whipped the martins out entirely last year, and built in their houses.—J. W. VAUGHN.



THE AUSTRALIAN BUSTARD.

Sheep Husbandry.

THE NATIONAL WOOL GROWERS' ASSOCIATION.

SINCE the calling of the National Wool Growers' Association in Syracuse, in December last, we have received a number of inquiries concerning it—chiefly in regard to its constitution, conditions and cost of membership, and to the advantages which would accrue to the wool growers of States now having no State associations, from establishing them and connecting them with the National organization.

The National Association was organized in 1865, by delegates representing the State Wool Growers' Associations of Wisconsin, Illinois, Ohio, West Virginia, Pennsylvania, New York, Vermont and the New England Association, embracing all the New England States. The Constitution, unanimously adopted, vested the government of the Association in an Executive Committee, consisting of the President, Vice-Presidents, Secretary, Treasurer, and one additional member, to be elected annually by each of the represented Associations. These additional members were subsequently increased to two from each State Association. The Vice-Presidents consisted of the Presidents of the represented Associations. Thus, practically, all these Associations have an equal voice in the government—each being represented by three persons chosen by itself. These provisions were extended to all State Wool Growers' Associations which might thereafter be formed. At the late meeting of the National Association at Syracuse, its Constitution was so amended as to authorize its Executive Committee, at its discretion, to appoint a Vice-President in any State not having a State Wool Growers' Association.

This plan of action, through a quasi legislative body chosen by State Associations, was the only one which could give a truly national and representative character to the National Association. If questions were to be determined, officers elected, &c., by a vote of the *members* of the Association in mass, the locality where the Association was held could always entirely control its action; its operations would often be too slow to meet the emergency, and the necessary frequency of meetings, to transact business now promptly disposed of by correspondence, would impose an intolerable burthen, both in time and expense, on the body of members. It is not too much to say that the workings of the present plan have given entire satisfaction to the represented Associations, and to the wool growers of the country generally. Not a shadow of local or personal prejudice or jealousy has ever tinged its proceedings. Its Executive Committee has never disagreed on a final conclusion.

All members of State wool growers' associations are, from that fact, members of the National Association; and at the general meetings of the latter all wool growers, from whatever State, or whether connected with any other wool growers' associations or not, have been allowed to participate as fully in the proceedings as members. Indeed, the same courtesy has been extended to persons having interest in sheep husbandry, or engaged in relative industries. The officers and other members of the Executive Committee serve without any compensation. Members of the Association pay no initiation fee. When money has been raised—and this has chiefly been confined to defraying the necessary expenses of delegates or committeemen employed away from home on the business of the Association—it has been raised by voluntary subscription, and usually in the State of such committeeman's residence.

The advantages to accrue to wool growers of States now having no State associations, from establishing them and connecting them with the National organization, depends entirely upon the fact whether those institutions have proved useful and are likely to prove useful in the future. If the State associations led to important improvements in the breeds of sheep, as they unquestionably did, prior to the late temporary overthrow of wool growing husbandry—and as they will unquestionably do again on the revival of that husbandry—then it is clearly the interest of the growers in all the States where that husbandry is an important one to possess and foster such associations.

And what claims has the National Wool Growers' Association, on the score of past or prospective usefulness, to the adhesion and support of the State associations? To answer this question properly requires allusion to a few leading facts in its past history. On all occasions of framing new wool tariffs in Congress previous to that of 1867, the wool growers either did not act at all or they acted without any general concert. They had no definite and adopted plan, based on a general and thorough investigation of all the facts on which their proper amount of protection depended, to place before Congress and the country. They were hemmed in between hostile wool manufacturers and anti-protectionists—the former, at least, far better provided with one-sided statistics. They always had zealous and able friends in Congress, but they were chiefly professional men, and could not be expected to know what the wool growers' interests actually needed better than they knew themselves. Thus acting, to a considerable extent, on conjectural data, the effects of legislation were necessarily uncertain; and when it appeared most favorable to the wool growers, it was generally found to contain loop holes for easy evasion.

The establishment of the National Wool Growers' Association opened a new era in all these matters. It combined and brought into co-operation a body of men greatly more numerous than the wool manufacturers, quite as strong in the sympathies of the people, and—we suppose there is no particular harm in saying—at least as strong in Congressional nominating committees and at the ballot box. Its first step was to make peace with the manufacturers; first, because that course was intrinsically right, and, second, because it could not obtain adequate protection without their help; and for precisely the same reasons the manufacturers met its advances half way. The first result of their co-operation was the wool and woolen tariff of 1867. The Executive Committees of the two Associations, through their sub-committees, spent more than six months in collecting the necessary information, and in maturing and agreeing upon the draft of that law. They met, differing widely in respect to some of its provisions. This was especially the case in regard to the duties to be imposed on foreign competing wools, and the struggle on this question was a protracted one. But the growers insisted that the rates of duty which were finally adopted, and which now form a part of the law, would no more than place them on an equality with their foreign competitors in our markets, and they preferred no arrangement to any one which would not produce that effect. Finally accumulated proofs in regard to the cost of the domestic production of wool, and "patient and intelligent scrutiny" in regard to the general facts, rendered the justice of the growers' claims so undeniable that the manufacturers' committee manfully assented to them, notwithstanding the anticipated (and subsequently experienced) violent opposition of a considerable body of wool manufacturers.

Without this co-operation of the manufacturers, we should not have had the wool tariff of 1867. Without the National Wool Growers' Association, we should not have secured that co-operation. This tariff was strongly endorsed by all the growers' State Associations and met the approbation of the great body of wool growers throughout the United States. And, notwithstanding the temporary prostration of wool industry which followed, that confidence has never been withdrawn or wavered.

Again, when a remarkable and unprecedented state of things enabled foreign growers of competing wools to profitably kill their sheep in order to enter their wool on the skin at our ports at greatly reduced duties, thus producing an important evasion of the tariff, (how important it was considered by the enemies of the tariff will appear from some exaggerated assertions of the N. Y. Economist published below) it required but a plain and fair statement of the facts, sustained by proper proof, made by the Executive of the National Wool Growers' Association, and assented to by the Executive of the National Association of Wool Manufacturers, to procure the passage of the "skin wool amendment," as it is ordinarily called, which imposed the same duties on skin as on fleece wool. All this was promptly done at the mere cost of drawing up a memorial, and of writing three or four dozen letters. Does any one believe that this important amendment could have been procured thus readily and easily at the instance of individuals not authoritatively representing any body but themselves, and bitterly opposed, as it was, by a strong body of manufacturers outside of the National Association of Wool Manufacturers?

Another branch of the Government has recognized the representative character of the Growers' and Manufacturers' National Association. The Secretary of the Treasury submitted to the examination of committees appointed by those bodies, the standard samples of wool required by the Act of 1867, to be placed in the Custom Houses to determine the classification of, and consequently the amount of duties to be levied on, foreign competing wools. He also allowed similar committees to make an investigation in the Custom Houses in regard to the manner in which that classification was practically carried out. We might enumerate numerous other cases where the National Associations have obtained concessions, or secured advantages from various quarters, which would have been out of the reach of individuals, or, in all probability, of State Associations. And the same is true of the Growers' Association when acting alone. We believe, as already said, that the latter has discharged all its duties to the public satisfaction. The efforts which it could make within its province have been generally successful. It has never divided on any question. It has never, so far as we know, had a noticeable defection from its ranks. The vitality which it has retained, through years of adversity to the wool growing interest, was emphatically illustrated at the late convention at Syracuse. Never, at any previous meeting, were so many States represented; and if the tariff of 1867 is "let alone" by Congress, it will be greatly due to the firm and spirited co-action of the wool growers and manufacturers on that occasion.

If the above is a correct statement of facts, there can be no reasonable doubt that every sound consideration of policy requires the multiplication of State Wool Growers' Associations, and their firm connection with the National Association. Each will contribute to the strength and influence of the other, and thus add to the common good and to the common safety.

The Swine-Herd.

"IMPROVED CHESHIRES."

S. S. GARDNER, Watertown, N. Y., sends the Farmers' Club of the American Institute the following letter:

So much has been said through the newspaper press in regard to this breed, that I feel it a duty to give the public the information I have never seen published, in regard to the origin of this popular breed of hogs, and to correct a statement made last Spring by F. D. CURTIS. T. B. STANLEY of Cambridge, Mass., wrote to the American Institute Farmers' Club: "Sometimes I see the hogs bred in Jefferson County, N. Y., called the Cheshire, and sometimes the Jefferson County breed. I should like to know which is correct, and if there were ever any hogs imported into this country from Cheshire, England." In reply F. D. CURTIS said: "There is a family of hogs in Jefferson County, N. Y., which has been bred long enough to be called a breed, which was established by crossing the Yorkshire with the native breed, and subsequently with hogs imported from Canada. They are a good breed of white hogs, and are called Cheshire by a number of the breeders of them. This is a very fanciful name, but when the pretension is coupled with it that they are Cheshire, and descended from hogs imported from Cheshire, England, then the name is very improper. It would be better to call them Jefferson County, and be truthful and consistent, and follow the example of Chester County, Pa., as they have done with their pigs, the Chester County whites. I do not believe any connection can be shown between the so-called Cheshires and any hog in Cheshire, England. The breeders of Jefferson county have done a good thing, and they need not be ashamed to give their county the credit of it." I think Mr. Curtis must have received his information from breeders in the south part of this county, who breed by crossing the Yorkshire with the improved native hogs, and sell their pigs under the name of Jefferson County breed, whereas the original breeders still adhere to the name of improved Cheshires—the name they gave them at the state fair held in Utica, N. Y., in 1863. As to the relation this breed has to the Cheshires of England, the public can judge by the statement I have from T. T. CAVANAUGH, of Watertown, N. Y., who is the originator of the improved Cheshire hogs. "Some fifteen or eighteen years ago (the exact date cannot be readily ascertained) MARK RICE, of this county, bought a boar pig of Mr. WOOLFORD of Albany. Mr. WOOLFORD said this pig was from a pair of hogs he imported from Cheshire, England. Mr. RICE crossed this pig with his native hogs, breeding in for a few years, which made a great improvement in them." In 1860 Mr. CAVANAUGH bought a boar pig from the stock of Mr RICE, that he crossed with a sow pig he bought of some dealers in stock who imported from Canada a sow that they called a Cheshire sow. From this pair Mr. CAVANAUGH raised a boar and two sow pigs. The improved Cheshires are highly prized by breeders in the West and South. Col. F. D. CURTIS, writing in the New York Republican of the exhibition of swine at our last State fair, very truly states that "some of the breeders of the Cheshire and Jefferson County hogs are in danger of bringing that breed into disrepute by mixing them with hogs of different characteristics and points, and still adhering to the name. In this way confusion arises, and a difference which is noticeable and which begets disgust. A breed is a breed, and for why? Because they (the specimens) have characteristics which are similar and which are perpetuated from parents to progeny; they become thorough-bred when their peculiarities are transmitted in the blood without difference or change. This principle is obviously upset when we see in the same litter of pigs some with upright ears—a distinctive point in the Jefferson County breed—and others with lop ears, which marks the Chester white and large Yorkshire. Humbuggery may flourish for a season, but the end will come." Some breeders in this county are crossing Yorkshire with Chester whites, and others, as before stated, are crossing Yorkshire with the improved native hogs, and are selling them under the name of Jefferson County hogs, for they dare not sell them under the name of improved Cheshires. The above are the principal reasons why the breeders of the original improved Cheshires still adhere to the name of improved Cheshires, and protest against any change of name, but call them the improved Cheshires of Jefferson County. The distinctive characteristics and points of excellence in the improved Cheshires, and which the breeders of the genuine adhere to, are these: They are pure white; fine, thin hair; small, thin, erect ears; short, dishing face; short leg, with good length of body; heavy ham and shoulder, light tail, and of very fine bone for a large hog. They are good breeders, and take flesh rapidly at any age. The breeders of these hogs claim that they will make more pork, according to the feed, than any other known breed.

CHAS. D. BRAGDON was called upon to comment upon the above paper, and said, substantially:—There is one thing which the correspondent does not establish—that the importation from Cheshire, upon which this improvement is based, was not Yorkshire; for, with Mr. CURTIS, I do not know of, have never read of, nor seen, a distinctive breed of swine known as Cheshires. The description given of the "Improved Cheshires" answers more nearly to Yorkshire than to any other breed I know. The importation may have been made from Cheshire, and yet have been Yorkshire. Because a pig is purchased in Hamilton Co., O., or in Jefferson Co., N. Y., it does not follow that it may not be of the Suffolk, Berkshire, Essex or any other breed; nor is it proper to assert it is a Hamilton Co. or Jefferson Co. breed, (unless such a distinctive breed exists,) because it came from either of those counties. But the name is of little consequence, so long as the public and legitimate breeders are protected by it. I can see the propriety of calling the results of this breeding by Mr. CAVANAUGH "Improved Cheshires," instead of the "Jefferson Co. Breed," provided they are distinct; for if a Jefferson Co. farmer breeds Chester Whites and Yorkshires, or crosses either on native stock, he may sell the progeny as "Jefferson Co. Breed," without the purchaser having any power of redress legally, albeit he may have supposed himself purchasing the breed known as "Improved Cheshires." Doing so, he swindles the purchaser, just as hundreds of men have been swindled by purchasing "Chester Whites," in Chester, Pa., which were in no wise related to the breed distinctively known as Chester Whites. My friend CURTIS would be likely to protest against any change of the name of his "Victoria" breed that would make it "Saratoga Co. Breed," and enable his neighbors to sell mongrels, no wise related to his pigs, in competition with him. The propriety, therefore, of adhering to the name by which this breed was originally known, and under which it has been bred and disseminated, seems to me to be apparent.

Mr. CURTIS said:—The general statements of the paper read are correct. I have seen the big hogs described, and am acquainted with the leading breeders. I knew before that there was a tradition in Jefferson Co. that the swine spoken of were descended from Cheshire, England. Mr. A. S. Clark told me years ago that they originated from a sow brought from Cheshire, England, and that he had crossed them upon hogs imported from Canada and improved them, and he gave them the name of "Improved Cheshire." Now, because the tradition is changed to a pair of pigs imported from Cheshire, that does not prove the breed to be Cheshire, because Yorkshire pigs could be imported from Cheshire, and I am still unconvinced that there ever was a thoroughbred breed of hogs known as Cheshire. There is no objection to the name Cheshire, if the pretension regarding the origin and breed be left off. I trust the coming convention of swine-breeders will settle all these vexed questions, and that our Jefferson county friends will be on hand to vindicate their excellent swine.

The Horseman.

NOTES FOR HORSEMEN.

Lame Mules.—I have two mules which were taken with sweeny last season, in plowing. I was advised to blow out the skin with a goose quill, and use gargling oil, which I did. The flesh filled out nearly perfect, but they are still lame, or, rather, stiff; and I am of the opinion, from what I see in your paper, that the affection is in the feet. One of them is affected in both shoulders (or feet;) the toes are too long, and the heel appears soft, the length of toes causing the heel to come more upon the ground. The other mule, with one shoulder affected, has a crack crosswise, about an inch long, which was near or at the hair at first, now within an inch of the toe, but he does not walk upon the heel like the other mule. Could you give me a cure? They came of a lot of mules that had been corned since September, after they were two years old, and the lameness came the season they were three years old. I think the cause was corn and confinement.—T. T. S., *Westfield, Ill.*

We shall be glad if some of our correspondents, experienced in the management of mules, would answer this correspondent. A good, intelligent farmer should be consulted about the feet. It is difficult, unless one has had experience in similar cases, to give advice; and not having had such, we do not choose to express even an opinion.

Water Farcy or Local Dropsy.—H. D. Brundage asks for a remedy for this disease. Water farcy is regarded as the offspring of weakness—of overwork and want of rest and proper food. When it appears it should be a signal for the owner to give the horse rest, improved food, action, well ventilated stable and a well bedded stall. Rub the part affected, when it can bear friction, thoroughly—the oftener and longer the better; saturate it every morning with pails of cold water, wipe it dry immediately and rub it with the hand. Give the animal every morning (to be made as wanted) a dose composed of iodide of iron, 1 drachm; powdered cantharides, 2 grains; powdered arsenic, 1 grain; cayenne pepper, 1 scruple; sulphate of iron, 1 drachm; treacle and linseed meal enough to make the ball. Sometimes the treatment directed above will be sufficient without the ball, if it is promptly applied as soon as the trouble is discovered. In any case the prompter the remedy the speedier and surer the cure; for often, if neglected, the limb becomes disorganized and hard, and the animal is liable to carry about an enlarged limb for life.

Wolf Teeth and Blindness.—Do wolf teeth cause blindness? If so, is there any remedy for the eyes after they begin to be filmy and weak, except to extract these teeth?—J. Jones.

Jennings says "it is a mistaken idea that these teeth exert any influence over the eyes. Nature never placed them in their position for the purpose of injury. Their removal can do no harm, but it is entirely an unnecessary operation." We confess that there are some facts which seem to dispute Jennings' position; for we have known animals suffering from blindness that seemed to recover after the teeth were extracted. Whether they would have recovered if the teeth had not been extracted, we cannot assert.

Sore-Shouldered Mules.—What can I do with my mule's shoulders. They are sore. Can they be hardened? If so, how? I cannot afford to keep them still.—G. E. B.

One of the best ways of keeping shoulders from getting sore, that we have ever found, is to wash them thoroughly with cold water and Castile soap every night after the day's work is done, and rub dry. In warm weather it should be done at noon and night. And the collars should be kept clean and fit well. The washing will allay any inflammation, and the cleanliness and good fitting collar will prevent exciting friction. And these are usually the causes of sore shoulders—want of cleanliness and care in the adjustment of the harness.

To Prevent Quarter Cracks.—I would be much obliged if some one would tell me how to *prevent* quarter cracks. In other words, is there any way to *thicken* or *strengthen* a horse's hoof where the shell is thin? I have a horse that has quarter cracked his hoof a number of times.—M. M. N., *Martinsburgh, N. Y.*

To Cure a Horse of Chewing his Tie Line.—C. M. Smith, Boston, Mass., recommends saturating it with capsicum a few times before tieing, and he thinks the animal will seek other amusement. C. H. Rhenard suggests the use of a chain instead of a strap, and says grease and tar mixed and spread on the leather has cured several cases. J. H. S. has never failed to cure a horse of the practice by wetting the strap well with kerosene oil.

Poll-Evil.—I send you a sure remedy. As soon as the sore is opened, wash with Castile soap, clean; then take lunar caustic, and be sure to get in to the bottom of the sore; leave it in six hours. Then make a wash of white vitriol and rain water, not very strong, stirring it thoroughly with the Castile soap, and wash the sore with it every morning. This cured a valuable horse for me.—J. D., *Jefferson Co., N. Y.*

Sassafras for Heaves.—I would like your correspondent who recommends sassafras as a remedy for heaves, to tell us *how* he uses it.—Subscriber.

Entomological.

MEALY BUGS.

I am very much obliged to you for the valuable receipe which you furnish a correspondent for destroying red spider. It is very effective, indeed. I am not so much annoyed by this insect, however, as what is commonly called "mealy bug." Its ravages are most provoking, especially among my Cissus vines, Passion flower, Camellias and Coleus. I have found nothing which kills the bugs, without injuring the plants also. If you will furnish an effectual destroyer of this common pest, you will greatly oblige many of your readers, besides.—G. C.

Put a half pint of spirits of ammonia into a pail of water, and either syringe or dip the plants into this solution. Plants infested with the "mealy bug" may be readily cleared of this pest by plunging in a newly made hot-bed, where the ammoniacal vapors can reach them. Sulphur, tobacco, and soft soap are sometimes used for this purpose, but we have found ammonia to be sure death and a cleanly application, while the others are not. It is said that the cresylic soap offered by our seedsmen will answer the same purpose, but we have not tried it on the mealy bug.

ENTOMOLOGICAL NOTES.

Oleander Scale.—Enclosed find an Oleander leaf infested with some kind of an insect which bids fair to ruin my plants. Please give me the name of the pest, and the best method of destroying.—A Subscriber.

The name of this insect is *Aspidiotus nerii*, or Oleander Scale. The specific name, *nerii*, is from *Nerium*, the botanical or scientific name of the Oleander. This insect is a great pest, as it infests many other kinds of plants, sucking their juices and otherwise injuring them. There are several methods in vogue among florists for destroying scale insects; but for such large plants as the Oleander, probably the best way is to syringe with hot water. Lay the plants down on the side, then apply water heated to 140 to 150 degrees, with a syringe. Turn the plant over and over until the leaves are thoroughly washed and the insect scalded. If a little soap is added to the water, sufficient to make what you would call a strong soapsuds, it will take hold of the scale more effectually than pure water. Do not heat the water too hot, although there is little danger of injury to the plants, unless it is up to the boiling point—212°.

Insects in Ohio.—During the past season there have been several things worthy of notice regarding the insects that usually trouble our crops in this section. First, the grasshoppers were remarkably scarce, and I did not see enough all summer to feed a chicken. So with the yellow chinch bug, so destructive to young plants of the gourd tribe. I failed to see even one. The curculio, too, was much less active than usual, so that for the first time in six years we had a fair crop of plums. *Per contra*, the small black cabbage fly destroyed nearly all the cabbage plants of those first set out. The cabbage worm was on hand again the past season. In 1870 there was none; in '69 many; and in '68 I first saw them. The currant worm is unknown here. I saw and handled some of the larvæ of the Colorado potato bug, taken from vines a mile east of me, but have not seen a full grown beetle. They will no doubt be here next season.—T. B. P., *Akron, Summit Co., O.*

Errata.—In our answer to a correspondent in Rural New-Yorker, Feb. 10, page 101, in regard to the Red Spider, the specific name should have been *telarius*, instead of *tetarius*.

The Apiarian.

BEE NOTES AND QUERIES.

Honey Producing Plants.—At the meeting of the American Bee Keepers' Association at Cleveland, recently, the following talk is reported upon this subject:—Mr. Hicks, of Indiana, advocated Alsike Clover as a honey plant, and for pasturage. Sow as clover seed is usually sown, in spring, without admixture with any thing else. Three pounds and a half of seed is enough for one acre. Blooms the first season. Flavor of honey is better than that from any other plant. Eight acres were near his apiary. Mr. Farnham of Indiana sowed plaster on his soil, as it was thin. His crop of hay from the Alsike Clover was better than other clover-hay. Chancey Hatch of Pennsylvania, said he never saw bees work on any other blossoms as well as they work on the Alsike. It comes into blossom about the 10th of June. Dr. Bohrer said he would not sow Alsike on "up" land. Mr. Moon sowed Alsike upon four acres of sandy land. It grew to the hight of four feet. He spoke with great earnestness for this clover. Gen. Adam said that in the south the Alsike does not do well, as it generally dries out, excepting upon the wet lands. Other plants were discussed. Mr. A. I. Root, of Medina, Ohio, said he had this past fall purchased 4, 000 young linden trees to set out in the spring. He keeps a hive upon a spring-scale, and notices the changes of weight every day. Mr. Hosmer reported fifty-three pounds of linden honey brought in by one swarm during the day. His faith in the linden tree is unbounded.

Bees Dying.—The last swarm of bees came out July 5. They have died. They had plenty of honey for the winter. I have one swarm four years old, from which the honey now seems to be leaking down, and a number of the bees are dying. What is the cause of their dying? I should like the opinion of some of your experienced readers. That which is dropping down out of my old hive, seems to be more like water than honey. My bees are cased in from all storms.—W. H.

It may be your bees are dying from lack of ventilation. We judge so, from the fact that the condensed vapor drops from the old hive. You should have stated in your letter the kind of hive, where it is kept, and how enclosed.

Industrial Societies.

N. Y. State Grape Growers' Ass'n.—At the annual meeting of the New York State Grape Growers' Association, held at Rochester, N. Y., Feb. 15, 1872, the following were elected officers for the ensuing year: *Pres.*—I. H. Babcock, Lockport. *Vice-Pres'ts*—C. L. Hoag, Lockport; Dr. F. B. Seeley, Vine Valley; G. W. Nichols, Hammondsport; D. W. Burge, Peach Orchard; Dr. H. H. Farley, Union Springs. *Cor. Sec.*—T. S. Hubbard, Fredonia. *Rec. Sec.*—G. F. Wilcox, Rochester. *Treas.*—M. D. Munger, Canandaigua.

Cowley Co., Kansas, Ag. and Mech. Society.—*Pres't*—M. M. Jewett. *Vice-Pres'ts*—A. T. Stewart and B. C. Swartz. *Secretary*—D. N. Egbert, Jr., M. D. *Ass't Sec'y*—A. B. Lemons. *Cor. Sec'y*—J. B. Fairbanks. *Treas.*—J. D. Cochran. *Gen. Sup't*—C. M. Wood. *Ass't Gen. Sup't*—A. D. Speed, and a board of thirteen directors. Second annual exhibition will be held in Sept. next, at Winfield.

The North-eastern Bee-Keepers' Association will hold its annual meeting at the Club Room of the Central New York Farmers' Club, in the city of Utica, N. Y., on the 14th and 15th of March, 1872. Bee-Keepers, and *all* persons interested in the development of this science, are earnestly requested to atttend and take part in the proceedings.

Riverhead Town, Suffolk Co., N. Y., Ag. Soc.—Officers elect for 1872: *Pres.*—Henry L. Hallock. *Vice-Pres.*—J. Horace Downs. *Rec. Sec.*—Zachariah Hallock. *Cor. Sec.*—Henri W. Seeds, Plants, Etc.

"FRESH, TRUE, RELIABLE" Garden, Field and Flower Seeds, "SMALL FRUITS," Fruit, Ornamental, and Shade Trees, Shrubs, Roses, Flowering and Bedding Plants (excellent stock), Tuberoses, Gladiolus, etc., etc. Use *true* first quality seeds and plants for first quality vegetables, fruits, etc. Our seeds and plants are of such a character that all may sow and plant with confidence that they will produce true, first-class crops. We grow thousands of small fruits and vegetables for market, and know the value of true and reliable seeds and plants to the farmer, gardener, and fruit grower, etc. We grow the best, and our customers shall have the same. Our catalogue—giving cultural directions, and description of Vegetables, Flowers, and small fruits, etc—and *Order Sheet* and *Direction Envelope*, sent to all on application. Seeds and plants by mail, pre-paid, to any part of the United States. Orders, *large* or *small*, shall have our best attention. *We make a specialty of Gardeners' wants.* Send for Catalogue, and take advantage of our reasonable rates. D. H. BROWN & SONS, Seedsmen and Small Fruit Growers, 24 Hiram St., and Cherry Lawn Farm, New Brunswick, N. J.

Fruit, Trees! Garden, Plants! Flower, Seeds!
Shade, Hedge, Garden,
600 Acres. 21st Year. 13 Green-Houses.

10,000 Apple and Crab Root-grafts, best sorts	$50
1,000 Pear, Plum or Tetofsky Root-grafts	15
1,000 Std. Pear, extra, 1 year Bartlett, &c., 3 to 4 ft.	100
5,000 Silver Maples, average 1 foot	10
10,000 Osage Orange Plants, 1st class	25
5,000 Concord Grape, or Willow Cuttings	3

Flower and Vegetable Seeds, large stock.
100-Page Illustrated Catalogue, 10 cents.
Colored Plates, Fruits and Flowers, 5 samples by mail, $1. Wholesale Price List free.
E. K. PHOENIX, Bloomington, Ill.

NEW AND RARE VEGETABLES.
I make the seed of New and Rare Vegetables a specialty, besides raising all the common varieties. On the cover of my Catalogue will be found extracts from letters received from farmers and gardeners residing in over thirty different States and Territories who have used my seed from one to ten years.
Catalogues sent, Free, to all. ☞ I grow over one hundred varieties. Get your seed directly from the grower. JAMES J. H. GREGORY,
Marblehead, Mass.

YOU WANT THE
CHOICEST ORNAMENTAL, FOLIAGE
AND FLOWERING PLANTS
ever offered in this country.
☞ See our Illustrated Catalogue of New and Rare Plants. Send stamp. Address
OLM BROTHERS, Springfield, Mass.

1872. TREES! TREES! 1872.
Apple Trees, three years, very fine; Peach, Pear, Plum, Cherry, Small Fruits, Ornamental Shrubs, &c.; White Ash, Elm, Maple and Chestnut for groves; 2,000,000 Evergreens, two years, from seed well grown, and fine. All at bottom prices. Price List free.
BARNES, BROS. & CO.,
Young America, Ill.

WHITE PROBESTEIER OATS were introduced by me in 1870, and the past season have yielded 101 bushels per acre. *Straw strong; not liable to lodge.* Grains large; hulls very thin. Weight 38 lbs. per bushel. Price $1.50 per bushel. Also **Excelsior Oats**, same price. Send two stamps for samples and circular giving full particulars, and prices of **Seed Corn, Peerless Potatoes and Garden Seeds.** WM. NEWTON, Henrietta, N. Y.

CABBAGE, ONION, SQUASH!
I have published three works, most amply illustrated, on the cultivation of these three vegetables, giving the thousand details so invaluable to the beginner. Price of each, sent post-paid to any address, thirty cents. JAMES J. H. GREGORY,
Marblehead, Mass.

Field Crops.

GROWING POTATOES UNDER STRAW.

In the RURAL NEW-YORKER of February 3d, your Illinois correspondent asks for information respecting the growing of potatoes on the surface of meadow or pasture lands, by merely dropping the seed thereon and covering the same with straw, without anything more being done until digging time. The above question I should have some difficulty in answering were I to attempt it just as it reads, for I have had no experience in growing potatoes merely by dropping them on the surface, without further preparation of any kind, except the covering of straw; but have produced a very excellent crop by previously plowing and cultivating the soil before planting. I also covered the seed not quite its usual depth before I applied the covering of straw, which was about a foot in thickness.

The growing of potatoes in this way is not without its difficulties. The information I have gained, not only by personal experience, but from various sources, and especially from those who have tried the experiment, all go to prove that the straw arrangement is not exactly a failure, nor by any means is it the *all in all*. Those who grew them on the surface without plowing, having only a straw covering, say in some instances they have done well; but the greatest difficulty to be experienced in growing them in this way, is in connection with the digging; they are so thoroughly mixed and tangled with the straw, together with the half rotten sod and soil, thus making it rather troublesome in securing them all. Another drawback to this mode of growing potatoes is the mice, which I have found to be rather destructive beings, the straw appearing to be just the place for them to operate in. The only benefit to be derived from this way of growing potatoes is, the straw covering acts as a special remedy to keep the moisture in the ground, especially in a dry season, and saves the ordinary cultivation in keeping down weeds, &c.—CANADA, *Province of Ontario*.

In the RURAL NEW-YORKER of Feb. 3d, 1872, an Illinois correspondent asks if any of the readers of the RURAL have, the past year, produced a crop of potatoes by dropping the seed on the surface of meadow or pasture land, without plowing, and covering it with straw; and with what results, &c. Now, as I have been raising potatoes under straw for the last thirty years and more, I will give you a bit of my experience. I did not raise any potatoes for some years past without plowing the ground. I have tried to raise them on sod and on plowed ground, without covering with ground before I put the straw on, but I had no good crops either way. It will do on sod, or on plowed ground, if you put plenty of straw on, in a wet season. I never raised a poor crop of potatoes yet, when I first plowed the ground then planted them in the same way as I would raise potatoes without putting straw on them. Last year—that is, last summer—was too dry here in Ohio for potatoes, and yet I raised a very good crop of good, large potatoes. I can now show you, if you will come and take a peep into my cellar, potatoes that weigh two pounds and two pounds and a-half, of the King of Earlies, Early Rose, Peerless, Prolific, Mohawk, and a number of other kinds.

I will tell you how I raised those large and good potatoes. In the fall of 1870, I plowed clover sod some eight inches deep; through the winter I hauled on a good quantity of barnyard manure and spread it all over the ground; in the spring of 1871, I harrowed the ground, manure and all, fine; then plowed the ground again as deep as I had plowed it before; then harrowed it fine again; then furrowed it out only one way, about three feet apart; then drilled in the seed in the furrows about 10 to 12 inches apart; the seed was some whole potatoes, some cut in halves, and some in less pieces, and some in single eyes; covered them about three inches with ground and hoed the furrows. This was done about the 10th of May; then covered the whole all over with straw from six to eight inches deep and left all be till digging time; then we used the HEXAMER six-pronged potato digger in scratching the straw off. We found many potatoes on top of the ground just under the straw.

I have been thus minute in the above, because so many ask me from time to time how I raise potatoes under straw. Now, gentlemen, if the above will do any one any good—and I know it will if you practice it—I shall be glad. Many ask me, too, which kind of potatoes I like best. This last question I will answer. I like the Early Rose best for early, taking yield, quality, beauty and flavor into consideration. The King of Earlies, or BREESE'S Fifty Dollar potato, as he has it in his Essay, is very good; and the Peerless, I think, is decidedly the best and most profitable potato I ever saw for late. I had it planted side by side with the Peach Blow last season; the Peerless yielded double that of the Peach Blow, and is a much nicer potato.—MICHAEL JACOBY, *Marion, O.*

SUTTON'S NEW GIANT HYBRID CLOVER.

NEW FORAGE PLANTS.

SEVERAL new forage plants are offered this season for the first time. Among those that come to us well recommended, we may mention Sutton's New Giant Hybrid Cow Clover, and Carter's New Annual Blue Clover. The first is claimed to be a hybrid between the common red clover (*Trifolium pratense,*) and the Zigzag clover, (*T. medium.*) It is said to be extraordinarily productive, and under favorable circumstances may be mown three times in one season. It is also very succulent, and succeeds on soils not well adapted to the growth of our common red clover. Whether it will succeed in this country or not, remains to be determined.

Carter's Annual Blue Clover is probably not a true clover, but a variety of *Medicago*, and we have to regret that its scientific name, or origin, is not given in the English journals, although they speak highly of its merits. Judging from the meager description received, and the accompanying illustration, we conclude it is nearly related to the common Lucerne, (*Medicago sativa,*) also known as Spanish Trefoil, Alfalfa, etc. The common lucerne produces flowers of a violet-purple or bluish color, and it would not require a very powerful imagination to suggest the name of Blue Clover. It is, however, a good old plant, well worthy of cultivation, especially in hot, dry climates; and we have only to hope that Mr. CARTER has really produced an improved variety, as claimed.

A NEW SEEDLING POTATO.

GEORGE W. WOODHOUSE of Vermont, an amateur cultivator of seedling potatoes, has raised a very promising seedling potato—so promising that the entire stock has been purchased by B. K. BLISS & SON, the introducers of the Early Rose to public notice. We give an engraving of this potato, which is said to have been raised from a seed-ball of the Jackson White in 1868. The Garnet Chili was growing in close proximity to the Jackson White, and the new seedling indicates that blossoms thereof were fertilized by it. The habit and growth of this seedling is described as much like those of the Early Rose, as well as its general appearance. Vines medium hight, somewhat spreading, and the tubers grow very compactly in the hill. For three years they have been grown side by side with the Early Rose, and have proved from seven to ten days earlier than that favorite variety. They are more productive than the Early Rose, fully equal if not superior in quality, flesh very white, dry and floury, an excellent keeper, and has, so far, shown no indications of rot. The present proprietors intend to test it the coming season and increase the stock. If it proves to possess all the good qualities claimed for it by the raiser, it will be named and offered for sale in 1873. It is not now in market. Mr. WOODHOUSE, who reserved a half peck of the stock of these potatoes for his own use, when he sold to the Messrs. BLISS, claims to have been offered $500 for that half peck—or $4,000 per bushel—by one of his neighbors. We do not mention this to excite in our readers an undue desire for a novelty. The offer reminds us of a friend of ours who sold a dog for $150. When we asked him how that happened, he said he received in exchange for the dog three magnificent pups at $50 apiece. The fact is, the Messrs. BLISS are men who will become satisfied as to the merits of this potato before they put it on the market; and what they then say concerning it may be regarded reliable.

FIELD NOTES AND QUERIES.

Seed from the Male Pumpkin.—Will some of your readers give their experience in raising pumpkins from the seed of what

CARTER'S NEW ANNUAL BLUE CLOVER.

is called the male pumpkin—the pumpkins with a protuberance on the blossom end? Also, if any have ever raised a pumpkin that did not appear on the vine several days before the blossom did. I ask these questions because there has been some discussion about the fecundity of different pumpkins (or their seed) and of what kind of blossoms produced pumpkins.—K., *Niles, Mich.*

The Best Kind of Spring Wheat.—A correspondent at Deep River, Conn., asks what is the best kind of spring wheat, and where seed may be had. We cannot say what the best kind for Connecticut is. The same variety of wheat is not adapted to all localities and soils. We shall be glad to receive experience relating to this subject. Our correspondent says nothing of the elevation and character of his soil.

Hungarian Hay.—B. O. JOHNSON asks if steaming will destroy the injurious properties of Hungarian hay. We cannot say from experience. Hungarian grass, if cut when in bloom and properly cured, will not injure any kind of stock. We think that is the best way of treating it; but if the hay on hand contains full formed seed, the testimony of those who have fed it is against its use, for horses especially. If we had such, we should not hesitate to try the experiment of steaming in a small way, and be guided by results.

Orchard Grass Seed.—G. WALKER is advised to write to any first-class seedsman, advertising in our columns, for Orchard Grass seeds; they will give him the price. It is an excellent pasture and meadow grass. We would not sow it alone. It does well to seed with red clover. For meadow, if sown alone, not less than two bushels of seed per acre should be used.

Alsike Clover.—B. B. OVERMYER asks if Alsike clover seed is taken from the second crop, as in the case of red clover. Let those of our readers growing it for seed answer, which is the best practice. On some soils we have known the seed taken from the first crop of blossoms. We cannot speak from experience, however.

Castor Oil Bean.—"A Farmer," Paola, Kan., asks the process of cultivation of the Castor Oil bean—the yield per acre, how the oil is repressed, cost of machinery, etc., etc. If any of our Southwestern readers, who have had experience in its culture, will respond to the above inquiry, we shall be much obliged.

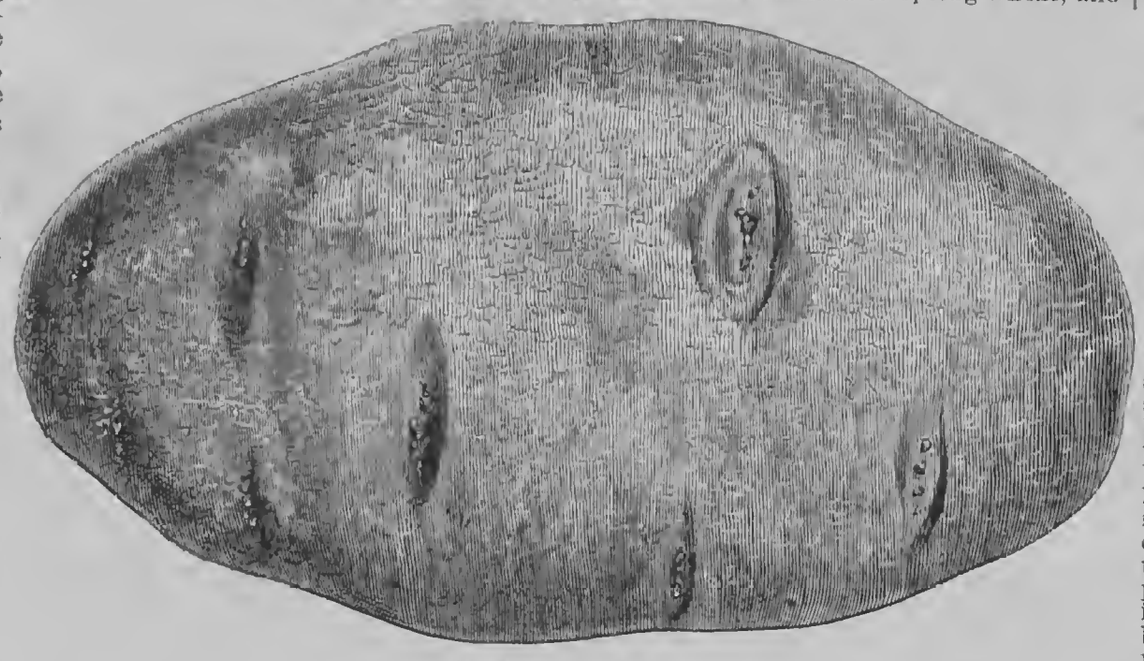
Landscape Gardening.

NOTES AND QUERIES.

Boston Common.—An English writer upon "Parks and Public Gardens in America" makes the following sensible criticism on Boston Common and its Garden attachment:—"Boston Common, which all have heard of, does not, to the stranger, seem an attractive spot, and a public garden formed on one part of it is, to our mind, as ill-looking a pattern as man ever designed for his delight. There is no breadth and no repose in it, but a dotting-about of beds and borders everywhere, and a piece of water in the center appears to have been designed from the pattern that would result from placing three fiddles with their necks together, and then tracing a mark around them. It will be apparent what I mean—a hybrid between the geometrical and the natural form of fountain basin; the whole surrounded by a vertical margin of stone."

To Cover a Steep Bank with Grass.—A German method is:—For each square rod to be planted, take half a pound of lawn grass seed, and mix it intimately and thoroughly with about six cubic feet of good dry garden earth and loam. This is placed in a tub and to it liquid manure, diluted with about two-thirds of water, is added and well stirred in, so as to bring the whole to the consistency of mortar. The slope is to be cleaned off and made perfectly smooth and then well watered, after which the paste just mentioned is to be applied with a trowel and made as even and thin as possible. Should it crack by exposure to the air, it is to be again watered and smoothed up, day by day, until the grass makes its appearance, which will be in from eight to fourteen days, and the whole declivity will soon be covered by a close carpet of green.

Grouping of Plants.—There is no way in which the deadening formalism of our gardens may be more effectually destroyed than by the system of naturally grouping hardy plants. It may afford most pleasing results, and impress on others the amount of variety and loveliness to be obtained from many families now unused. Trees and shrubs, distinguished for their fine foliage, collected in a quiet glade; and then bright-foliaged trees should be set in contrast with quieter colors, and varied with bright beds of flowers and leaf plants, or hardy flowering shrubs. These groups should be irregularly but artistically planted. Then on a knoll plant a large bouquet of the rosaceous family—hawthorns, cherries, plums, pears, peaches, almonds, &c. There is so much that may be done to add to the bewildering beauty of a landscape by naturally artistic planting, that we are often astonished that people do not "see it."



A NEW SEEDLING POTATO.

Pomological.

CALIFORNIA PEARS.

A FEW years since California pears were objects of much interest in our city, but during the past season there have been fifteen car loads of them introduced, and now they can be seen daily in our principal retail fruit stores; in fact, are the only fruit now in our market. Among the first arrivals of this fruit was a car load which arrived August 1st, consisting of Bartletts, each box containing, on an average, eighty pears, which sold for about $4 per box. This fruit arrived in fair condition, and sold readily, although our fruit of the same variety were cheap and very plenty. The extremely choice fruit sold as high as $6 per box; but the soft fruit reduced the average to the price named above.

The next received was the Vicar, and they were the most beautiful fruit of this variety that I have ever seen, being remarkably clear-skinned, and many possessing a most beautiful blush. A box contained about eighty pears, and sold, on an average, at $4 per box. These arrived about the hight of our Dutchess season, which interfered with their sale. The Glout Morceau is the next on the list of arrivals, averaging about ninety per box, selling at the same price as Vicars.

If the California growers will permit, I would like to offer them a suggestion, which will add materially to their profits in sending their fruit to this market. That is, simply to send only the very best and perfect fruit, for two reasons:—The first is, we can grow enough common stock to meet the demand; second, the cost of sending poor fruit here eats it up, and the profit, if any, is made on the best quality. Every packer should forbid his men putting in any knotty or imperfect specimens in the boxes; by that means the dealer will be enabled to insure perfect specimens to his customers, who will pay a much larger price for it, knowing that there will be no culls to cause a loss to him in selling.

I am aware that our native growers are looking with a deal of interest to the present and future attempts of the California growers to introduce their fruits in our markets, and, judging from the experiments made with pears, these attempts will prove successful; and although the experiments made with the grape have proved unprofitable, I think that in three years at most they will succeed in furnishing us with much better fruit than is imported.

NOW AND THEN.

New York City, Feb. 15th.

POMOLOGICAL GOSSIP.

Early Harvest Apple in Virginia.—The following letter from DANIEL F. COCK, Hampton, Va., was written by a gentleman who harvested one crop of Early Harvest apples in June last, and a second crop in November, from the same tree or trees. Concerning this variety of apple, as grown in Virginia, Mr. COCK says:—"I see during the discussion, at the meeting of the American Pomological Society, held at Richmond, that this variety was not recommended for cultivation in this State. I append a short statement of my crop for the last five years. I have only an acre of them, which were set out in the winter of 1860; there were about sixty trees set out, full a dozen of which have since died, leaving less than fifty trees. I sold in the year—

1867, 41 bbls.,	which netted,	clear of	exp'se..	$123	00
1868, 17	"	"	"	"	"	.. 102	20
1869, 54	"	"	"	"	"	.. 109	80
1870, 53	"	"	"	"	"	.. 207	43
1871, 64	"	"	"	"	"	.. 254	50

"This, remember, from one acre. The orchard has been manured broadcast, three times during the five years, which I do not count as expense to be deducted from the price obtained for the apples, as I have had it sown with grain and clover for green food for stock, which will pay for all expense of manuring. This variety may not do as well in other parts of the State; but this, I think, shows that it should not be condemned throughout the State."

Information about Strawberries.—If AMOS W. W. will look over our book list, he will find the title of a pamphlet on Strawberry Culture, costing only 20 cts., that will give him all the information he appears to need at present on this subject. Strawberry culture has been treated pretty fully in the RURAL NEW-YORKER, and we shall probably again refer to the subject whenever a good opportunity presents.

WE SHALL BE GLAD to receive information concerning any new fruits of merit that are to be introduced this season.

Farm Economy.

GOUX'S ABSORBENT CLOSETS.

EVERYTHING which tends to preserve health, promote economy, and increase the agricultural products of the earth, is worthy the serious attention of all. We have recently examined a patent absorbent closet and urinal, introduced into this country, which is in extensive use in Europe, and has received prizes and medals in France, notably at the Paris Exhibition in 1867. The GOUX system of closets is so simple and effective in its operation, so scientifically correct, and of such practical utility, it only needs to be understood to be appreciated. We do not need, at this time, to enlarge upon the importance, as regards the health of our population, and the saving of resources to the agriculturist, of the careful collecting of all the animal excreta, much of which is now allowed to run to waste. Nothing is so rich in those salts and elements upon which vegetation feeds, as the refuse of our houses, and it would well pay any municipal government, or private individual, to put in practical operation a system like GOUX'S, for the purpose of converting all this rich material into a manure which can be used without difficulty. Our present system is as bad as it can be, since it is no system at all, and in many instances, notably at country hotels, public institutions, depots, offices, etc., is a disgusting promoter of disease, besides being a waste which no community can afford.

FIGURE 1.

FIGURE 2.

The system of dry earth closets has defects, which the GOUX system entirely overcomes. In the former a holder containing dry earth, by a valve and lever arrangement, throws a small quantity of earth upon the excretion, thus deodorizing it. The practical use of this machine is troublesome, and the closet is limited to dry earth, which must be frequently renewed in the holder. In the GOUX system there is a tub, (Fig. 1,) which contains a layer of some dry substance, which has been packed around a mold, (shown in Fig. 2.) When the mold is withdrawn, a cylindrical space is left in the tub for the excreta. The fluids are absorbed by the dry substance, which prevents fermentation, and a shower of deodorizing powder falling upon the excretion, completes the mechanical operation. The improvement consists in packing the tub, as shown in the cut, A, being the lining, composed of some dry substance. When the tubs are filled, they are removed, and their contents put upon the manure heap, a freshly-lined tub being substituted. The whole operation is simple, and in no manner disagreeable. The absorbing material is lightly packed about the mold, and may consist of chaff, chopped or broken straw, damaged or refuse hay, coarse grass, dry street-sweepings, dry horse-dung and litter, sweepings of markets, hay and straw lofts' refuse, wool and hair, wool shoddy, varec or seaweed, charcoal dust, dry peat, dry fern, etc., etc. Any or all of these to be mixed in such proportions as may be most convenient, together with a small percentage of sulphate of iron or sulphate of lime. The material is then ready for use.

Excreta holders, or tubs, prepared after this simple and inexpensive plan, may be fitted by the country resident to any seat, and placed in any house, where they may be used until the cavity is filled. This can be done by farmers at a trifling cost, far less than the expense of constructing a pool or cistern, while the ease and comfort with which the tubs can be removed, must give them popularity as fast as they become known. With this arrangement there is no danger of impairing the health of the family, and a source of profit arises from the product. For the best class of houses, and for use in sick rooms, hospitals, etc., an automatic closet has been devised, by the use of which the objections raised against dry closets in general are entirely obviated and done away with. They actually absorb and completely deodorize all the gases, which, under the best conditions, still escape from other dry closets. The mechanism is self-acting, and so simple that there is hardly a possibility of its getting out of order; and the commode, by its compactness and reduced size, may be placed in any apartment without inconvenience, in sight or otherwise, to the most fastidious taste.

A urinal, constructed on the same principles, as shown in Fig. 3, has been devised, which secures for use this most precious of fertilizing agents. The interior of the holder is filled with the absorbent earths, as shown in the cut, the liquid being conducted through the pipe, C, which is perforated at the lower end. This simple device is very effective, and may be used in dwellings and offices.

After a protracted trial made at Aldershot during last season, the British War Department, on the recommendation of several sanitary commissioners specially appointed, has determined to adopt the system. Although the contract was made and arrangements prepared for about 4,000 men, yet the service has extended, without difficulty or inconvenience, to about 11,000 or 12,000 men, and no complaints have been made.

The large town of Halifax, Eng., has also adopted the system, and will soon be entirely fitted. The towns of Bradford and of Wakefield, after a close examination of the results obtained at Halifax, have decided on adopting the system. For hospital purposes it is unrivaled.

FIGURE 3.

The GOUX system is now being introduced in this country, and its practical operation may be seen at the establishment of A. L. OSBORN & Co., 424 West Canal St., N. Y.

The Poultry-Yard.

FEEDING POULTRY.

I DO not know of a single item in poultry keeping upon which I am so undecided as to the proper amount of feed for laying stock. As to the kind of food, we can take nature for our guide and believe that variety is preferable to any one kind. I do not believe it policy to keep any kind of stock poorly. Yet we are constantly advised that we must avoid fat in fowls intended for layers. I have generally accepted this idea, but of late have become somewhat skeptical.

It has occurred to me that I would like to compare the weight of eggs produced by some prolific "biddy," or even an average of layers with her own weight, in a given time. And when we *know* how much they will exceed our most sanguine expectations, the question comes to us, what should be the material used to favor this egg-producing machine, and how supplied?

In conversation with Dr. P., of our place, upon this point, a few day s since, he claimed that it was perfectly absurd that a fowl should not be fat to lay well, and proved his theory by his own practices. The Dr. keeps corn constantly before his fowls, and in addition gives them a warm breakfast of equal (pounds) of wheat bran and corn meal. Here we clash again in keeping feed before them. I have never practiced it, believing it to be unwise and unnatural. But I must confess that the Doctor succeeds in getting eggs earlier in the season than I do. I have never succeeded in getting a good supply of eggs any earlier than many of my neighbors, though I am always happily disappointed with the year's product, as I find they pay well.

GEO. K. HAWLEY.

POULTRY NOTES AND QUERIES.

Are Pigeons Quarrelsome?—I have bred fancy pigeons about three years, and have had a little time to notice their habits. Every night when they go to roost, they have more or less quarreling. I have a good many coops, and allow one of these to a pair of pigeons; but if one pigeon flies to another's landing, a fight generally ensues. I have known two pigeons to fight half an hour; then they stopped because one had his leg hurt so that he did not get over it for about a week. In the day time, I have also noticed them fighting on the roof; also when they were being fed.—G. K. TINKER.

THE statement Mr. RUFUS PEET, Castile, N. Y., refers to, was confined entirely to the common tame pigeons, the writer wishing to convey the idea that they (the common tame pigeons) were very quarrelsome. How quarrelsome? As much so as Baltimore Orioles; and they, the Baltimore Orioles, would fight till they died, to obtain sole possession of a tree they had selected to hang their nests upon. Nothing was said of wild pigeons, or any other varieties. It is so many years since Mr. PEET visited the pigeon roost in Otsego county, that I am sadly afraid you are, like myself, getting on the wrong side of seventy, and need a new pair of specks. The "C" was a mistake of the printer, and the owl a creature of your own invention. I have nothing to do with either.—G.

Worms in Pigeons.—A writer in the Cottage Gardener states it as his belief that "worms are, in most cases, the cause of so many pigeons wasting and dying; also that the malady is contagious." He adds: "A short time since I went to see the stock of an old fancier—crouched in a pen was a good-bred Tumbler in the last stage of the so-called consumption. I told the owner what the bird was suffering from; he laughed at the idea. The bird was examined after death to convince him, and it contained upwards of one hundred worms, some of them two inches in length."

Inducing a Hen to Sit.—VINCENT FRASER says, "if any one will take a *laying* hen—Brahma or Cochin to be preferred—and will place her in a sitting-box, only just large enough to hold her nest, into which have been previously placed half a dozen eggs, and will keep her very warm, she will soon show a desire to sit. Her food must be stimulating, and should consist of Indian corn, raw liver chopped, buckwheat, hempseed, and a small portion of bread steeped in ale."

"Sure Cure for Roup."—On page 130 we gave a "Sure Cure for Roup," furnished us by a correspondent, which FRANK FORD, Ravenna, O., claims is his own invention, of which he has a copyright. He cautions all papers against copying it from our columns.

Diary of a Ruralist.

DAILY RURAL LIFE.

FROM THE DIARY OF A GENTLEMAN NEAR NEW YORK CITY.

Unprotected Plants. — *Feb.* 26. — We have had but very little snow this winter, consequently all small plants have suffered more or less. Strawberries that were not protected last fall are considerably injured, and many of the most extensive cultivators of this fruit say that the prospects for a crop next summer are very poor indeed. The weather has been very dry and cold, and to-day the dust is almost as abundant as during a drouth in August. Whether this unusually severe winter upon strawberry and other plants will teach fruit growers a good and useful lesson, is at least doubtful, although it should; but they have been so accustomed to trust everything of the kind to chance that it will require more than the loss of one crop to teach them to do otherwise. If we have a short crop of small fruits next summer, cultivators will play constantly on that "harp of a thousand strings," "bad luck," which is only another name for neglect. During my eighteen years experience in cultivating strawberries near New York city, I have never known a winter so mild that protection was not actually beneficial, even if not positively necessary. I have known the plants to be well protected with snow for two or three months in winter, but two or three weeks of freezing and thawing weather in spring would injure them and lessen the yield at least one-half. I have always found it best to be on the safe side, when it could be done without too great an expense.

Sowing Grass Seed.—*Feb.* 27.—I have sown the seed of twenty species of grasses in my green house to-day, all different from the fifty which I cultivated last year. Perhaps some of the readers of the RURAL NEW-YORKER may wish to know what I want to do with so many different grasses, while it is quite evident that not one in ten is worth cultivating for any practical use. My object is simply to obtain specimens of each for an herbarium; and I have found this the best method of studying the habits of each particular species, of which seed can be procured. When the plants have arrived at the proper stage (which is usually when in bloom, or a few days later), they are either cut or pulled up, and the requisite number of specimens carefully pressed and dried, then labeled and put away in my herbarium. Now, this is a very cheap and simple way of acquiring a knowledge of grasses or other plants. I will also venture to say that any farmer or farmer's son, who can name fifty species of the most common grasses, is considered quite an oracle in botanical lore; and yet, any boy of twelve years can, if he will, acquire this amount of knowledge in one season. I will suggest a plan by which farmers can learn the true names of a large number of the different species of useful and ornamental grasses. Suppose there are five or ten men or boys in a school district who desire to obtain a knowledge of the plants which are essentially the foundation of all our agricultural wealth. Let them club together and send five or ten dollars to some well-known seedsman for fifty or one hundred species of grass. A small paper of seed, costing not more than five or ten cents each, will be sufficient of any one species. Let these be distributed among the members of the Club, or allow any one who is known to be skilled in such matters, to cultivate them, being careful to preserve both the common and scientific names. At the proper time save as many specimens as there are members of the Club, or even a greater number will be found useful. Press, carefully label, and preserve for future study and reference. At an expense not exceeding one dollar, each member of a Club could obtain from fifty to one hundred species of grasses with their proper names attached. Any young man who will start with this number will not be very likely to cease his efforts until hundreds are added to the collection. Other plants besides grasses will be very likely to receive attention, and the boy who might otherwise grow up in ignorance of the simplest weed under his feet, will eventually become a man of more than ordinary intelligence, if not of great scientific attainments. Whenever our agriculturists learn how simple a thing it is to obtain a knowledge of their own immediate surroundings, we shall see a much higher order of questions asked by them through the agricultural press.

Boys; begin your grass herbarium this spring, and teach your fathers the difference between Red-top and Blue grass; also show them that while Wheat, Rye, Oats and Corn are true grasses, Red and White Clover are not. And while you should be ever ready to listen to the aged and learn wisdom of them, if they possess any, be sure and have something to give in return. If you want any further information on this subject, write to the Editors of the RURAL NEW-YORKER, and they will no doubt answer your questions.

Pruning Young Pear Trees.—*Feb.* 28.—Last spring I planted fifty two-year-old standard pear trees, upon very light, sandy soil. Knowing that pear and apple trees succeed best on rather a heavy soil, I did not expect that my trees would make much growth the first season, if ever. Of course I attended to the planting myself, and gave each tree two good wheelbarrows full of old, well-decomposed manure, mixed with the soil for a space of three or four feet, near the tree. The results have exceeded my expectations, for the trees made a most vigorous growth; some of the new shoots are at least four feet in length. I should add that I pruned the trees severely when they were planted, the branches being shortened to about one foot, which I firmly believe had as much to do with their vigorous growth last summer as the manure, careful planting and after culture. I am now pruning these trees again, not so severely as last year; still every young shoot is shortened; those that are four feet long are cut back to two feet, and all others in about the same ratio, occasionally removing a branch entire, to keep the head of the tree open. If these trees were not pruned at all, (as some would-be authorities on fruit culture advise,) they would soon become the most ungainly, ill-appearing things imaginable. Instead of the fruit being produced on the strong, lower branches, which are able to sustain the weight, it would be on the tall, slender twigs, and it would sway about until blown off before half mature. By judicious pruning, we can build up a tree into almost any desirable form, and make it produce its fruit just where it will be the most convenient for gathering, and be certain it will not be blown off before maturity. The natural tendency of most varieties of pear trees is upward; but a wide-spreading, open head is the most desirable form for producing a large crop of fine fruit; therefore we must prune to correct natural defects.

Floricultural.

HOW TO START FLOWER SEEDS IN A HOT-BED.

EVERY person who makes any pretensions whatever to floriculture, should have a hot-bed; and as they are simple in their construction, and easy in preparation and management, the wonder is that there are so few who avail themselves of their advantages. Almost any of the "Catalogues and Floral Guides," issued by seedsmen, will furnish explicit directions for their construction, preparation and care. And you who have never had one let me entreat you not to let the present season pass without making the experiment.

Well, then, presupposing that you have announced to Mr. CAUDLE that you intend to have a hot-bed this season, and that the dutiful man has provided you one, properly placed on the sunny, sheltered side of some house or fence, and that the proper season is approaching for planting it, while we leave it awhile to heat, we will prepare for the campaign in such a manner that we can take care of our vegetable offspring with ease, and also be able to transplant them when old enough, without placing nine-tenths of them in jeopardy by the operation.

To begin with, hunt up some firm, strong paper; if your husband has the misfortune to be an Editor, go to his office and get some of those exchanges, in which he has always been puzzled to discover any utility, because they are too stiff for wrapping paper, and too clumsy even for kindling the fire. Or you might do a good thing by giving some of the "Musical Reviews" the exquisite satisfaction of having accomplished some good in the world, by using them. Take of your stout paper, a piece six inches wide and thirteen inches long; fold it in half, lengthwise; then fold it up in three-inch squares, four times; by opening it partly and letting it form a cube, you will discover that you have the four sides of a box, with an extra inch to lap over to sew it together; then take a double piece, three inches square, and sew in for a bottom. After the first one is made, you will find it so simple that the manufacture of fifty or a hundred of these boxes is a small task. A sufficient number of boxes made, you are ready to sit down in the house and plant your hot-bed in a warm room, instead of encountering the rough, spring winds. But first have ready, also, your little, thin, pine label, sharpened at one end, to stick down, properly marked, into the boxes, as fast as they are planted.

Now get your pan of nice soil and your box of flower seeds, a little block of wood with a square end to settle the dirt in the boxes, and a dozen or so of shingles, and we will go to work. Now fill your paper box nearly full of dirt, settle it and smooth it with your little block, then plant it thinly with seed on top of the soil, sprinkle a thin layer of dirt to cover, pat it down, and, after putting the name on your label, insert it in the side of the box and put it on a shingle; and so continue until you have planted all you wish, remembering to put such fine seed plants as will not bear much sun without scorching, on the same shingle, so that they can be placed along the sides of the frame and be protected from the sun.

The benefits arising from these boxes are that you may raise a single plant in each, if you choose, and that you are enabled to transplant tender plants from the hot-bed to the ground, box and all, without disturbing the roots; here the box soon decays. As the boxes frequently become tender from being watered, they would be difficult to handle unless placed on shingles. If, after placing your shingles of boxes in the hot-bed, you would cover each with strips of flannel, to hold the moisture, your seeds will more certainly and more rapidly vegetate. Where you raise a number of plants in a box you will find it much easier to tear away the paper and separate the plants for transplanting than by the usual method. The above hints may seem too simple to commend themselves to the better sense of the floriculturist; but if they will secure a trial for a single season, the process, simple as it is, will be fully appreciated. Last year, by planting a single seed to a box, I was successful in growing three fine plants of the exquisite and rare green-house plant, *Clianthus dampieri*, which bloomed; and with that most exquisite vine, *Cobea scandens*, I have always been successful by the same process. MRS. L. G. BEDELL.

Crown Point, Ind., Feb., 1872.

GLADIOLUS SEEDLINGS.

How do you raise Gladiolus from seeds?—HORACE SCHWERIN.

SEED gathered last fall should be sown next spring in frames or in the open ground, covering them not more than a half inch deep. If the seed are soaked for a few hours in warm water before sowing, they will germinate in less time than if this operation is omitted. To obtain a good strong growth the first season, requires considerable care and attention. The soil in which the seed are sown should be light and friable, because, if it is a clay, there is danger of its becoming so hard that the young seedlings will fail to break through. The surface of the bed should also be kept constantly moist, in order to assist germination, besides keeping up a continued growth in the young seedlings. The two principal reasons why so many persons fail in growing such plants from seed are:—They either cover the seed too deeply or, if shallow, they allow the soil above them to become so dry that the seed or plants cannot grow. As a rule, cover the seeds very lightly, then give plenty of water. If these conditions were always secured, we should have less complaining about poor seed and failures. It requires two to three years under ordinary circumstances to produce blooming bulbs of Gladioli from seed; and although it is a tedious process, much pleasure may be derived from their culture. New varieties are certain to be produced; but whether they will be improvements upon old and well known sorts, is a matter of chance.

FLORICULTURAL NOTES.

Standard Works on Botany.—Which is the best standard work on Botany for the practical use of nurserymen and florists, and where can it be obtained, and at what cost.—J. B. K.

WOOD'S and GRAY'S are standard works on American Plants; but if you wish to study up nurserymen's and florists' plants, quite a number of books will be necessary. We have several hundred botanical works, but occasionally come across plants not described in any of them. New plants are constantly being introduced, and these are described in Botanical Magazines, which one needs to study in order to keep up with the times in botanical knowledge. GRAY'S School and Field Botany is a late work, and valuable to those who do not desire a very extensive knowledge of exotic plants.

Dairy Husbandry.

IMPROVED CHURN TOP

THERE are many "patent churns," but few of them are worth anything. The "old-fashioned" dash-churn is preferred by many housekeepers; and, after all, we believe it the best. Milk can be churned in it in as short a time as in any other, provided it is in proper condition. If not in proper condition, no churn on earth can "make the butter come" as it should. Nearly all the churns that are made have tops which are sawed out of a piece of solid

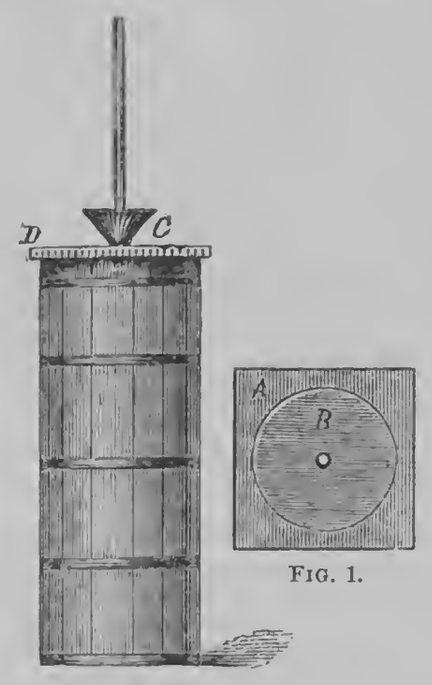


FIG. 1.

FIG. 2.

wood, with a circular disk in the center to prevent the milk from running over the top from the dash hole. Besides this, these tops almost invariably warp, so that a crack is left around the edge of it, from which the milk splashes and is wasted. I never use the same top I get with a new churn, on that account, but go to a carpenter's shop and dress off a dry poplar or pine board which is an inch thick; saw it off about twelve or fourteen inches square, as in *A*, Fig. 1; then I take a similar board and saw it *round*, as at *B*, Fig. 1, to fit the top of the churn; these two pieces are screwed or nailed firmly together; a 1½ inch hole is bored in the center (a little larger than the dash staff), see Fig. 1. Such a top cannot warp. I then take my new top to the tinner and have a tin funnel made and fitted permanently in the hole, as at *C*, Fig. 2, the letter *D* representing the edge of the top spoken of above. The taper end of the funnel fits the hole nicely all the way through, and is bent around under the bottom of the hole, which effectually prevents milk splashing out of the hole; while the funnel itself prevents the milk from slopping out over the edge, even in the hands of a careless beginner. This funnel is only made four inches high and about five inches wide at the top. If you will have such a contrivance made, you can churn your milk on a tapestry carpet, without fear of its being soiled. Simpler and far more useless things than this are often "patented."

Stanford, Ky. WOODMAN.

DAIRY NOTES.

Cows Bag Caking.—A correspondent of the New England Farmer says: "When cows' bags "cake" after calving, let the calf bunt it down, after milking away so much that the calf has not quite enough for his supper. As prevention is better than cure, I have learned the best way is not to let their bags get "caked." In the morning, when I let out my cows, if there is one I think will calve during the day, I put her back in the stable and keep her there, and do not let her *drink until her bag is milked down*, and then only part as much as she desires, and if the chill is taken off the water, all the better. Avoid a rich slop, as you do not want to start the flow of milk too suddenly. Remember the cow is weakened by her labor, and should be treated accordingly. It is natural for a cow as soon as she drops her calf, to go and drink heartily of cold water on account of her fever; the consequence is she gets a cold and it settles in her bag, and causes the caking difficulty.

Cure for Rancid Butter.—A correspondent asks for a remedy for rancid butter. Heretofore a correspondent has said, in the RURAL NEW-YORKER, that sweet or sour milk will sweeten frowy butter much better than salt or saltpetre. There is nothing which absorbs whatever is offensive to the smell or taste, so quick as milk, cream or butter, and no agent can be employed that will so quickly or surely extract the wooden flavor from new dairy utensils.

Domestic Economy.

ODDS AND ENDS.

Apple or Fruit Dumplings.—A lady inquires how to make "Apple dumplings and rice puddings." I know how. The best and nicest way to make any kind of fruit, berry or jam dumplings, is to wet up a good dough with salaratus, sour cream and buttermilk; if only with sour milk, use a small lump of butter for shortening; take a piece of dough the size of your two fists, roll out until it is a little less than half an inch thick; spread fruit, berries, or jam on it; roll it up, tuck in the ends, and boil it in a pudding bag, allowing it room to swell; put it on to cook in boiling water, and don't allow it to stop boiling; it will be done in just one hour; when eaten, cut in slices across the end; five dumplings of this size are enough for a large family, or a half dozen hungry men; bring them to the table piping hot, one at a time; eat with fine sugar and butter, and drink good milk. This is a nicer way than to make a dozen separate dumplings and turn them naked into a kettle to boil and sputter, and flop and swear, and burst open, and come to the table watery and washy, and not looking a bit appetizing.

To Make Rice Pudding, say in a quart bowl, take two eggs and two heaping tablespoonfuls of fine sugar, well beaten together; fill the bowl half full of cooked rice, a few little bits of butter, and a good handful of raisins; stir in all well together, then fill the bowl with new milk. After the ingredients are thoroughly mixed together, bake in a hot oven half an hour. When set away to cool, take a spoon and stir it up so as to mix in the melted butter on the top and the raisins at the bottom. Eat with cream, slightly sweetened. Season with nutmeg, or whatever you like. It is a good plan, if one's family is large, to bake a rice pudding in a basin, and make two quarts at a time. —R.

Apple Dumpling.—I give my way of making what amounts to the same thing as dumplings, and is far less trouble. Peel and core tart apples, half a milk pan full; cover well with water; have ready some dough, made like biscuit, rolled out round to cover the apples. Put the pan on the stove while the water is cold; cover it tightly with another pan, or something that will give it room to rise, and let it stew half an hour. The steam will cook the dough nicely, and it can be cut and served the same as dumplings. Have plenty of water in the pan, that it may not boil dry. Some call this an "Apple Jonathan," but it deserves a more poetical name, for if well done, it is delicious.

Rice Soup.—Let the liquor in which beef has been boiled stand over night, then remove all the grease from the top, put in a half teacup of rice, and let it boil, gently, a half an hour. Season with salt, pepper and butter, and thicken with a couple of spoonfuls of flour and water, stirred together.

For Vegetable Soup, instead of the rice, put in the same liquor, add to it a quarter of a head of cabbage, chopped fine, a turnip, a couple of onions, if you relish them, a half dozen potatoes, all chopped fine; season to your taste. Put in some of your cold beef, hashed up. This makes excellent soup. Never be guilty of throwing away the liquor in which you have boiled fresh beef.—A FARMER'S WIFE.

Apple Dumplings.—One quart flour, one tablespoonful baking powder, one do. butter; mix baking powder well through the flour, and then the butter. Take sweet milk enough to mix the same as for biscuit. One apple to each dumpling, peeled and cored; wrap around it, and then steam or bake.

Pot Pie.—One quart flour, one egg, one tablespoonful baking powder, a little salt. Stir very stiff, and drop a large spoonful in the meat when boiling. Serve as soon as done.—KATIE *of Kansas.*

To Ornament Butter.—Make the butter the desired shape. Then make a hole in a piece of cloth, the size of the vine wished; wet the cloth, and squeeze some butter through; then squeeze more butter through coarser or finer cloth, for flowers or frostwork, and ornament to suit the fancy.

Stair Rods.—Will some one tell, from experience, which is the best kind of stair rods?—L. A. C., *Levanna, N. Y.*

Domestic Inquiries.—W. E. L. B. asks the best process of making and baking various kinds of Graham bread.

COOPER'S

LEATHER-STOCKING NOVELS

"THE ENDURING MONUMENTS OF FENIMORE COOPER ARE HIS WORKS. WHILE THE LOVE OF COUNTRY CONTINUES TO PREVAIL, HIS MEMORY WILL EXIST IN THE HEARTS OF THE PEOPLE. SO TRULY PATRIOTIC AND AMERICAN THROUGHOUT, THEY SHOULD FIND A PLACE IN EVERY AMERICAN'S LIBRARY."—*Daniel Webster.*

A NEW AND

SPLENDIDLY-ILLUSTRATED POPULAR EDITION

OF

FENIMORE COOPER'S

WORLD-FAMOUS

Leather-Stocking Romances.

D. APPLETON & Co. announce that they have commenced the publication of J. Fenimore Cooper's Novels, in a form designed for general popular circulation. The series will begin with the famous "Leather-Stocking Tales," five in number, which will be published in the following order, at intervals of about a month:

I. THE LAST OF THE MOHICANS.
II. THE DEERSLAYER. IV. THE PIONEERS.
III. THE PATHFINDER. V. THE PRAIRIE.

This edition of the "Leather-Stocking Tales" will be printed in handsome octavo volumes, from new stereotype plates. Each volume superbly and finely illustrated with entirely new designs by the distinguished artist F. O. C. Darley, and bound in an attractive paper cover. *Price, Seventy-five Cents per Volume,* or $3.75 for the complete set. The series, when completed, will make, bound, an elegant library volume, for which binding-cases will be furnished at a moderate price.

PREMIUMS AND CLUB TERMS.

*** These club terms are designed specially for towns where there are no local booksellers.

Any person sending us the amount in advance for the complete set of the "Leather-Stocking Series," $3.75, will receive gratuitously a handsome steel-engraved portrait of J. Fenimore Cooper, of size suitable for binding in the volume. Any one sending us the amount in full for four complete sets of this series ($15), will receive an extra set gratuitously, each set accompanied by the steel portrait of Cooper. The volumes of the series will be mailed to each subscriber, post-paid, as rapidly as published, and the portrait immediately on the receipt of the remittance.

D. APPLETON & CO., Publishers,
549 & 551 Broadway, New York.

TWELVE MUSIC BOOKS

WHICH CONSTITUTE A

COMPLETE MUSICAL LIBRARY!

1200 or more Songs and Pieces for Piano-Forte or Reed Organ. Worth from $300 to $400. Sold in book form for $30!!

THE MUSICAL TREASURE. *Vocal and Instrumental.* The most recent work. Very popular.
THE SILVER CHORD. *Vocal.* Large number of the best Songs.
GEMS OF GERMAN SONG. *Vocal.* The very best Songs of Deutschland.
GEMS OF SACRED SONG. *Vocal.* A choice collection.
GEMS OF SCOTTISH SONG. *Vocal.* Selected from a large number. The best.
WREATH OF GEMS. *Vocal.* Popular Songs. More recent than Silver Chord.
OPERATIC PEARLS. *Vocal.* Comprises most of the favorites of Standard Operas.
SHOWER OF PEARLS. *Vocal.* Completely filled with the best Duets.
PIANIST'S ALBUM. *Instrumental.* Is the same as Home Circle, Vol 3.
PIANO-FORTE GEMS. *Instrumental.* Is the same as Home Circle, Vol. 4.
HOME CIRCLE. Vols. I and II. *Instrumental.* These fine books gave a name to the whole set, which is often called **The Home Circle Series;** all the books being of uniform binding and size, and filled, not with the most difficult or the most severely classical music, but with that which is genial, bright, popular and fitted for the entertainment of the happy "circle" at home.

Price of each book, **$2.50** in Boards; **$3** in Cloth, and Full Gilt, **$4.** Sent, post-paid, for the above prices.

A POCKET DICTIONARY

OF THE ENGLISH LANGUAGE.

Abridged from Webster's Quarto. Illustrated with nearly TWO HUNDRED Engravings on Wood.
By Wm. G. Webster and Wm. A. Wheeler.

This volume embraces a careful selection of more than 18,000 of the most important words of the language. The introduction contains, besides the Pictorial Illustrations, Tables of Money, Weight and Measure, Abbreviations, Words, Phrases, Proverbs, &c., from the Greek, the Latin, and the Modern Foreign Languages, Rules for Spelling, &c., &c.; making altogether the most complete and useful pocket companion extant. It is beautifully printed on tinted paper, and bound in three different styles. Tucks, gilt edges, $1. Sent by mail on receipt of the price.

AFTER April 1, 1872, the Rates for Advertising in MOORE'S RURAL NEW-YORKER will be as follows:

Inside, 14th and 15th pages (Agate space)	.90c.	per line.
" 5th, 7th, and 13 pages	1.00	"
Outside or last page	1.50	"
Fifty per cent. extra for unusual display.		
Special Notices, leaded, (by count)	2.00	"
Business "	2.50	"
Reading "	3.00	"

All orders for Advertising received at the New York office on or before April 1st will be charged at present rates only. For at least one cogent reason for our advance, or "New Departure," in Advertising Rates, see RURAL Feb. 24.

INVESTIGATION.

No matter whether the motives for legislative investigation into the doings of the executive and administrative officers of City, State and National Governments are purely political and partisan, or not, all good citizens must rejoice at the check it is likely to prove in the future upon corruptionists. It exhibits the power of the people. It is an assertion of their sovereignty, and of the responsibility of office-holders to these sovereigns. More than any political campaign, with its banners and blatant blowers and bummers on either side of the "political issue," it is teaching the people with what system they are being plundered, and what an enormous tax they must pay for their indifference to the peremptory duties citizenship involves and imposes upon them.

Let the watch be kept up! Let the independent press of the country continue to sound the alarm, and, without fear or favor, point out the men whose official action is not above reproach, and sustain the men who diligently seek to serve the public with honest purpose and ability. Let the periodical wrangles for office continue, and thereby secure the exposure of venality in both parties. But let the people vote for the *best men*—for honest and able men, if they can be found on either ticket, regardless of what is called their "principles." For, in a moral sense, the voting for a principle, by voting for a professional office-seeker and partisan bummer, who professes to represent said principle, and one he has not the moral ability to comprehend, is one of the most vicious rocks which lie concealed beneath breakers of political enthusiasm and partisan strife. An honest man, if wrong in principle, will soon discover what is right and adopt it; but a dishonest man in office, no matter how unobjectionable the platform upon which he was elected, is like JONAH in the ship—he must be thrown overboard, or the party and the Government will perish.

Let our readers watch the course of, and developments made by, the various Committees of Investigation at work sifting the chaff of corruption from the wheat of loyalty to the Public Welfare. It will help in determining the course which they, as citizens, should pursue in the selection of public servants. It will reveal how politicians make the people pay the expenses they incur to influence the votes of the latter. It will guage the amount of patriotism which enters into the public service. It will help them to distinguish the difference between statesmanship and professional place-hunting. It will teach how low an estimate public officers place upon the intelligence, independence and honesty of the people—how easily they think them molded to serve their political desires and ambitions. To us it seems that there is no harp having so many strings, and which needs to be played upon so persistently, as that which shall arouse the people to a comprehension of the dangers which surround the Republic in the forms of venality and ambition. Let us think about it, and act upon our conclusions with unflinching disregard of partisan bonds and traditions.

RURAL NOTES AND QUERIES.

Condition of Southern Cotton Planters.—The Plantation, in an article preliminary to the Agricultural Convention which met in Savannah, Feb. 22, has some sensible words. It says:

The picture which Georgia now presents, in common with the other Southern States, is sad beyond expression. Our condition is anomalous. Our towns and cities are, for the most part, in a flourishing condition. The cotton crop has been sold for many millions of dollars. Who has got the money? Not the cotton planters! They are now, as a general rule, more in debt than they were in 1871. Not the negroes who worked the crop. For the most part they have saved nothing. The dealers in fertilizers have received their share. The merchants have had the benefit of their trade, and the banks of their discount, but the great bulk of the money has gone to the West for mules, bacon, corn, flour, hogs, &c., and to the North and Europe for goods made out of our cotton.

Concerning the cause of this condition, the Plantation says:—"If the proceeds of the cotton crop had remained among us, we should have been comparatively easy. But it is gone, and gone chiefly to buy articles which ought to have been produced at home. We will not repeat our statistics as to the amount which has been expended for mules, hogs, bacon, flour, &c." And it forebodes the future as follows:—"Yet, in the face of these stern truths, we fear that more cotton will be planted this than was planted last year. It is the insanity of the gambler who ventures everything upon a last throw of the dice. It will be the last throw; for as sure as a large crop is planted, prices will go down ruinously. The present debt will be increased instead of diminished. Georgia landed estate, as a consequence, will go to the hammer, as landed estate has done in Alabama." It advises:—"Sell one-half the land to wipe out debt, and afterwards raise no more cotton than can be produced clear."

Farmers as Legislators.—A correspondent writes us:—"Is it not a shame that the farmers—the great agricultural interest of the country—are not more completely represented by men of their own class in our legislative halls?" Yes; but it is the fault of the farmers themselves. When farmers become educated business men, and have clear and comprehensive opinions upon public policy, and have learned to recognize their true relations to other industries and professions, and have had the tuition which participation in the Farmers' Clubs, Agricultural Societies, etc., will afford them, and learn to think clearly, express themselves intelligently, co-operate with each other, and organize for self protection—in short, when they learn their real interests, and shall have learned how to command attention for them, they will become legislators and will secure voice in the State and National Councils. But they have yet to learn, in a majority of cases, that there is nothing in the vocation of a farmer which absolves the individual from the duty, nor debars him from the privilege of becoming the peer in intelligence of any man, or class of men, in any profession whatever.

"Arbor Day" in Nebraska.—At the last meeting of the Nebraska State Board of Agriculture, the following resolution was adopted, which we trust will impress our readers in other States, as it does us, with its eminent propriety, and stimulate them to urge the establishment of a holiday to be known as "Arbor Day," as a national institution. Here is the resolution:

Resolved, That Wednesday, the 19th day of April, 1872, be, and the same is hereby especially set apart and consecrated for tree planting in the State of Nebraska, and the State Board of Agriculture hereby name it "Arbor Day," and urge upon the people of the State the vital importance of tree planting, and offer a special premium of $100 to the county agricultural society of that county in Nebraska which shall upon that day plant properly the largest number of trees, and a farm library of $25 worth of books to that person who on that day shall plant properly in Nebraska the greatest number of trees.

Dairy Exhibition in Austria.—The Austro-Hungarian Consul in New York city has favored us with a programme of an exhibition to be held at Vienna, Austria, December 13-17, 1872, which is to embrace all kinds of dairy products. The exhibition will include two groups. The first group is designed to be confined to the Hungarian citizens' products from milk. The second group is to be international, and include all devices to be used in the manufacture of butter and cheese—dairy implements and utensils, models, designs and plans of cheese factories, milk-rooms, dairy houses, barns, etc. Americans who desire to exhibit, must notify the General Consulate of the Austro-Hungarian Monarchy, N. Y. City, not later than September 30, 1872, of their intentions, in order to secure the required space for exhibiting their articles.

Patrons of Husbandry.—The Iowa Homestead pronounces the statement published in the RURAL NEW-YORKER, Feb. 17—upon which we commented—that the Lecturer of the Order in Iowa "is advising farmers no longer to communicate through Agricultural Journals without pay," "one of the slanders about the Order," and adds, "we have sent one of the paragraphs to our State Lecturer for an official denial of the charge."

Since the foregoing was put in type, J. C. ABBOTT, Clarksville, Iowa, has written a letter in which he pronounces the assertion relative to what the Lecturer is advising farmers, "a willful falsehood," and challenges the editor with whom it originated to produce his proof. We are very glad to learn that it is false. We must say, however, that the tone and spirit of Mr. ABBOTT'S letter might be more dignified and liberal, without doing injury to the Order he professes to represent.

National Swine-Breeders Convention.—This Convention, proposed at the Farmers' Club, in this city, by Mr. F. D. CURTIS, seems to meet with favor wherever its objects are understood. The National Live Stock Stock Journal, Chicago, indorses the movement, and says:

"There are several persons in various portions of the country ostensibly selling stock for breeding purposes, who pay no attention whatever to the description of stock they send out, and the respectable breeders should see that the public is protected from this sort of imposition, and that the reputation of their own herds does not suffer from these systematic and deliberate frauds. And it is high time that some check should be placed upon the operations of these rogues, who fill a half-dozen orders for as many different kinds of thorough-bred swine from a single litter of a mongrel sow. And if this means Herd Book, or anything else, let us, by all means, have it."

Fighting Manufacturers of Agricultural Implements.—In Iowa the Patrons of Husbandry are moving to reduce the cost to the farmers of agricultural implements. It is asserted that the Granges have, as a general thing, secured a reduction from manufacturers of ten to fifteen per cent., and, in some cases, twenty per cent. It is also stated that in Howard and other Northern counties the members have resolved not to purchase a reaper or mower for one year, supplying their places by repairing their old ones and loaning or hiring them to such as have none. The Dallas Co. Grange has resolved not to purchase a cultivator from the ring of manufacturers who are striving to obtain a heavy royalty from those manufacturers who refuse to pay it.

Indorsing the Signal Service Bureau.—At the February meeting of the Middlesex Co. Farmers' Club, held in New Brunswick, N. J., upon the motion of Mr. Thompson, seconded by Prof. G. H. COOK, the following resolution was adopted:

Resolved, That this Club has full confidence in the Signal Service Bureau, and cordially approves of the efforts made by that Bureau to benefit the agriculture of the country in a practical manner.

The Secretary was directed to forward to you a copy of this resolution, and request you to insert it, or such reference to it as you prefer, in an early issue of your paper.

GEO. H. LAMBERT, Sec'y.

Deferred.—We are constrained to defer over two columns of new advertisements, in type for this paper, rather than infringe upon reading departments. Advertisers who desire to secure prompt insertion should send in their favors as early as convenient.

THE SEASON.

Hampton, Va., March 2.—It has snowed and blowed a perfect gale all day; drifts of snow 3 and 4 feet deep. Never, in our experience of seven years here, have we had such a day before.—N. R. D.

Salisbury Center, N. Y., Feb. 24.—Good winter for business with us. Plenty of snow, and weather cold and dry. No rain since Dec. 31st. Water very low in the streams. Wells mostly dry. The coldest day Dec. 21st; mercury fell 28° below zero. To-day it is 50° above. The average temperature has been a little above zero. Hay $18@24 per ton; potatoes, 50c.; butter, 22@25c.; eggs, 22@25c.; apples, none in market.—A SUBSCRIBER.

South Scoville, N. J., March 4.—We have had an unusual severe winter, particularly the month of February. But little snow until Saturday, the 2d inst., when it fell 10 inches. Snow is melting away slowly, and spring seems yet in the distance. No gardening done yet, and but very little plowing. Wheat looks unpromising, especially late sown. Peach buds are all right; prospect fair for a good crop. Corn is worth 80c. per bushel; flour, $8 per bbl.; potatoes, 50c.; sweet potatoes, $1; pork, 7c. per lb.; butter, 35c.; eggs, 25c. Stock is looking poor; cattle are not sufficiently protected, in this county, from the cold storms of winter.—W. D.

Middleville, Barry Co., Mich., Feb. 26.—To-day is pleasant, warm and spring-like. The winter has been the coldest for several years. Snow averages about twelve inches; thermometer ranging in the neighborhood of zero all of the time since about Dec. 10th, the coldest day being Dec. 20th—at 11 P. M. 24° below zero. Farmers are now preparing for sugar-making on a grand scale. Fears are entertained for the wheat crop for 1872; it does not look very well. Prices of produce are:—Wheat, $1.40@1.50; oats, 35c.; corn (shelled), 50c.; potatoes, 75c.; apples, 75c.; butter, 15c. per lb.; eggs, 20c. per doz.; dressed hogs $4.50@5 per cwt.; lard, 8c.; hay, timothy, $12@15 per ton; milch cows, $30@40; working cattle scarce at $1.25@2 per yoke; clover seed, $5.50@6.50; timothy, $3@4.—I. F. E.

RURAL BREVITIES.

IF H. G. W. W. will address E. A. Van Velger, Oneida Community, N. Y., he will obtain an answer to his inquiry.

S. B. ALEXANDER is informed that H. O. Welch, Chestnut Hill, Philadelphia, Pa., is the owner of "Flora Temple."

T. N. SCANLON is informed that we do not know what, if any, inducement the Argentine Confederation offers to emigrants.

LET HERMAN SMITH address any of the New York city seedsmen, advertising in our columns, for seed wheat, onion seed, &c.

J. H. H. writes the RURAL NEW-YORKER that if hickory timber is cut in June, it will be neither wormy nor grow inelastic.

A DROVE of 500 turkeys recently arrived at Mt. Pleasant, Iowa, where they were slaughtered for the New York market.

T. G. WILLIAMS should address R. H. ALLEN & Co., 189 Water St., N. Y. city, with reference to transportation of stock from England.

SEMI-MONTHLY market days for the sale of dairy products are to be established at Watertown, Wis., by the Wisconsin Dairymen's Ass'n.

T. G. WILLIAMS is informed that a letter addressed "Daily Rural Life," RURAL NEW-YORKER office, will reach the author of the Diary.

IT is reported that Mr. H. E. BIDWELL, South Haven, Mich., has 300 fig trees in good condition, from which he has received two crops of fruit each year for two years.

SECRETARY BLISS of the Vermont Dairyman's Association, says the St. Albans dairy market is a myth—that there is no market day, no organized Board of Trade, no system of reports.

JOHN P. REYNOLDS, late editor of the Live Stock Journal, published at Chicago, has severed his connection therewith, and is to conduct the Live Stock Department of the Prairie Farmer.

IN response to an inquiry from a Utah lady, we reply that we have never used any of the $5 sewing machines, nor seen them work; hence, cannot give an opinion as to their comparative merits.

A CALIFORNIAN is informed that if we had a boy in Kentucky that we did not want to go after, we should have him forwarded to us by Express, unless we knew he could travel in company of some one who would take good care of him.

R. P. MAIN, Oregon, is informed that Chas. V. Riley, State Entomologist of Missouri, (St. Louis, Mo.,) published a history of the Colorado Potato Beetle, in his first Annual Report upon the Noxious and Beneficial Insects of Missouri. You may possibly get it by addressing him.

OUR happy and live friend, WILLIAMS, of the Horticulturist, seems aggrieved because one of the contributors to this paper made (odious?) comparison between the Horticulturist as it was and is. Of course everybody knows the Horticulturist is the "best journal of its class"—so, what's the use?

BUSINESS INFORMATION.

Vegetable and Flower Seeds.—We are indebted to Messrs. V. P. DOUW & Co., wholesale and retail dealers in Garden and Flower Seeds and Farming Implements, Albany, N. Y., for their Spring Catalogue; also for a copy of a beautiful oil chromo, entitled "The Ducks," which they give to all who order $2 worth of garden or flower seeds in packets. The Catalogue is sent free to all applicants. Such offers, from a reliable firm, are worthy the attention of all our readers interested, and we take pleasure in referring to advertisement in this paper.

A Good Exhibit.—Is that comprised in the Statement of the National Life Insurance Co. of New York, given on page 189 of this paper. The figures—showing receipts, disbursements, assets, etc.—demonstrate that this popular Company is in a very prosperous condition.

PUBLISHER'S SPECIAL NOTICES.

The Rural New-Yorker is electrotyped, and hence Back Numbers can always be supplied. Copies for sale by all News Dealers; price Six Cents.

March on During March!—Is what all our Agents, and others disposed to form Clubs, should do. It will not only pay to enlarge present Clubs but to form new ones. It is an easy matter to recruit for the new style RURAL, and PAYS both Agent and Subscribers—and now is the best time to do "that same."

Additions to Clubs are always in order, whether in ones, twos, fives, tens, or more. A host of people are subscribing for papers about these days, and we hope our Agent-Friends will give everybody an opportunity to subscribe for the best.

BUSINESS NOTICES.

HOW TO OBTAIN A "COLLINS"

Solid *Cast* Cast-Steel Plow for $5. For particulars, address COLLINS & CO., 212 Water St., N. Y.

"The Best," is a term always applied to Burnett's Preparations. They deserve the title.

SCENES IN COLORADO.

In the four illustrations of remarkable scenery in Colorado, which we give our readers this week, some idea may be formed of the wonders of the heart of the American Continent—of those territories in the Rocky Mountain regions, which are now knocking at the door of the Union for admission as States. The building of the Union Pacific Railroad opened up a vast region of wild natural scenery, which has since become familiar to the tourist on the Pacific Coast. Since the completion of the Kansas Pacific Railroad, which runs through the great garden prairies of Kansas, the tourist living east of the Mississippi River is enabled to visit Denver, Colorado Springs, Pike's Peak, and other famous places, riding all the way in a Pullman palace car, with no ferries and no change! Only three years ago, the scenes we depict now were so far removed from civilization, few people ever beheld them, and then at the expense of a tedious journey across the plains in overland mail coaches. This was the manner in which the late Fitz Hugh Ludlow journeyed to Pike's Peak, and beyond, the incidents of which have been given to the world in "The Heart of the Continent."

Not far from Denver, going west, is the bold scenery which we illustrate, in the vicinity of the famous Colorado Springs. These springs, it is confidently anticipated, will some day become the Saratoga of that section of the country. Their site, as shown in the picture, is in the midst of mountains, valleys and uncommon rock formations. The water resembles Congress, Vichy and Pyrmont, and is chalybeate, containing sulphur, soda, lime, magnesia, etc. Mr. Ludlow says:—"We made as good lemon soda water as I ever tasted, by filling, in the liveliest part of the main spring, and corking up instantly, a bottle, which we had previously charged with lemon syrup and tartaric acid." The altitude of these springs is a lineal mile higher than New York or Philadelphia. From this, and other reasons, these springs are looked upon as conducive to health in a remarkable degree. Three miles from the springs, we come to a place called "Beautiful Gate—Garden of the Gods," with Pike's Peak seen in the distance. This fanciful name is due to the curious forms of the rock masses, which one may imagine resemble petrified gods of the Scandinavian mythology. Some of these masses reach a hight of four hundred feet, two of the loftier ones making a fine portal to the gateway of the garden, as shown in the illustration. These "gods" rise abruptly out of perfectly level ground, and are of an intenser red than any sandstone seen at the East.

The group of natural monuments which we show, standing in what is now called "Monument Park," are masses of sand and *debris* from decayed rocks, above a hundred feet high, and bearing on their summits disks which form largely projecting capitals, probably representing the original diameter of the pillar. The tinge of these "monuments" is a pale cream-yellow, while the capitals are of a brick-dust color. These skillfully turned cylinders, spindles and cones are supposed to have been turned into their present shape by the wind, as they are far removed from the action of water.

"Farming in the Park" is one of those pleasant scenes now familiar in Colorado. These "Parks" are watered directly from the snow-peaks, being indeed only the inner court of those peaks, and catching the droppings from their eaves. The portions of the "Parks" most thoroughly irrigated remain beautifully green throughout the year; and over the whole region herbage is abundant. Their sheltered situation insures them an equable climate. Stages run from Colorado Springs to the Great Parks, and other places of scenic interest.

SPARKS OF JOLLITY.

The cheapest wine you drink — the wine of other people.

Strange but true—1872 will contain only forty-six weeks, for the other six will be Lent.

Mrs. Partington says she does wish they would hurry up and pass the silver service bill in Washington.

Douglas Jerrold once said to a very thin man:—"Sir, you are like a pin, but without the head or the point."

It is difficult to understand why some people exhibit so much solicitude about their lungs, when their lungs always take air of themselves.

"One can't have everything," as the man said who was down with small-pox and cholera, and the yellow fever came into the neighborhood.

Are dem bells ringing for fire? asked Pompey of Tiberius. No, replied Tiberius; dey hab plenty of fire, and dey is ringing de bells for water.

Curran was once asked by one of his brother judges, Do you see anything ridiculous in this wig? Nothing but the head, was the reply.

Boarding-School Miss:—"Oh, Charley, I expect to graduate next Commencement." "Graduate! what will you graduate in?" "Why, in white tulle."

A friend who did the Coloradian mountains last fall, has informed us that he got as ravinous as a raven among the ravines, and sat down in one of the gorgeous gorges and gorged himself.

It was rather personal in a California newspaper man to chronicle the purchase of a mule by a brother editor as a remarkable instance of self-possession.

A batchelor is one whose stock of love, sympathy, and affection, is so small that he cannot afford to share it with another, but must e'en keep it all for himself.

One who is perhaps a little too critical says that the majority of the country preachers could burn quite as well as the old religious martyrs—they are so dry.

A careful country gentleman refused to let his gardener plant three greengage trees, because he had an objection to any moregages on his estate.

The word "state" spelled backward is "etats" in French. It is not safe, however, to learn French simply by going back on your English.

Not generally known—A shoemaker always finishes his shoe at the beginning, and begins at the last.

Our Story-Teller.

BEFORE AND AFTER.

A THRILLING ROMANCE OF THE WAR FOR THE UNION.

Written Expressly for Moore's Rural New-Yorker, BY TWO WELL-KNOWN AUTHORS.

[Continued from page 170.]

X.—A Refusal and a Wedding.

"Oh, Mr. Brayton, how glad I am to see you! Oh, how glad!" cried poor, pale little Margaret, rushing into the library. "And you are well—quite well?" she continued, seizing both his hands and impulsively pressing them to her lips.

"Very well, thank you, dear," he replied. "Or, rather, much better than I ever expected to be, Maggie. I sent for you hastily, on a little matter of business; and now if you will please sit down by my side a moment, I would like to tell you a story."

"But what is the matter with Susan—dear Susan?" replied Margaret, advancing to the octoroon, who, with her beautiful head buried in her hands, sat weeping bitterly.

"I have frightened her,—that is all. Please listen to me, Miss Margaret, for my time is precious. I have only two hours to remain with you at present, and during that time I have a host of things to settle."

Margaret settled herself obediently, and waited for her visitor to speak. For a moment his face was cast down, and the hot blood mounted to the white temples—then as quickly receded, leaving the man as pale as a corpse.

"You are fond of Susan, I know, Miss Margaret." Brayton commenced in low, measured tones.

"Oh, Mr. Brayton, please don't!" sobbed Susan. "If you have the least mercy, keep this terrible secret to yourself."

"Fond of Susan!" said Maggie; "Fond of Susan! Why, I love her like a sister! What does the girl mean? What terrible secret is there to reveal?" And Maggie rushed from one to the other like a mad girl.

"There is nothing terrible about it," replied Brayton; "at least not to my way of thinking. Your father, you know, Miss Maggie, promised to give Susan her freedom the very night before he died. The war crushed that hope; but now, thanks to a merciful God, Susan is as free as you are. I want you now to join your entreaties with mine, to persuade Susan to go North with me as my—as my *wife*, Miss Margaret."

For a moment the young lady was stunned with the suddenness of this intelligence; then rising, said, with that impetuosity so natural to her—

"But, Mr. Brayton——"

Brayton immediately interrupted.

"There are no buts in the premises. I know what you would say, and I admit it is only natural that you should give utterance to your thoughts, but you must excuse me for not listening to it. If you love Susan as your sister, you certainly cannot love her any the less on account of her becoming my wife."

Poor Margaret, broadened and chastened though she had been by the events of the last few years, could not understand this step. Susan's skin was as white as hers—"But still she had been a slave, and there was the acknowledged negro blood in her veins. What could Mr. Brayton be thinking of to marry her?" This query was written all over the young lady's face, though, to do her justice, she did her best to conceal all evidence of the embarrassment she endured.

"Miss Margaret is right," sobbed Susan, again. "It would be wicked—my dear master—wicked, wicked, wicked. I can never go with you; Oh! never! never!" And here the poor woman broke down altogether.

"Susan, I have come for you; if you love me you will go with me; and if you do *not*, you must remain. Speak quickly, for I have not a moment to lose."

"I love you with all my heart, and you have always known it. I can say no more, but I can never go with you. Good-by, Mr. Brayton, and God bless you."

With these words still trembling upon her lips, and with the look of desperate calm in her eyes that was natural with her, Susan went slowly from the room. Brayton tried to speak and implore her to stay, but his emotion choked him, and he let her drift beyond his reach while he looked on helplessly.

"Mr. Brayton, what does it all mean?"

"It means, MAGGIE, that I love SUSAN, and would make her my honorable wife. And by Heaven I should do no despite to my proud blood! Her blood is proud, too. MARGARET, that woman is your father's sister."

"Do you know what you say, Mr. BRAYTON?" answered the girl, collecting all her force, "Do you know what you say?"

"Perfectly well."

"Does SUSAN know of her relationship to the family, to the HEATHERSTONES," she continued, her lip curling with haughty irony, as she pronounced the name.

"She knows it, and has known it for years."

"Who else is aware of this relationship?"

"Old HANNIBAL."

"And no one else?"

"Not another soul, as far as I know."

"Did father know?"

"Yes. Do you remember your Aunt LOUISE?"

"Very imperfectly. She died when I was a little girl; but I have heard father talk of her so much that I seem to know her. Did you know her, Mr. BRAYTON?"

"Yes, MAGGIE, and she was an angel. I don't wonder she died young."

"But what had she to do with SUSAN? I beg your pardon, she must have been SUSAN'S sister. How dull I am. But, Mr. BRAYTON, I am not used to this kind of family reckoning."

"Dear child, I comprehend your position perfectly. Your Aunt LOUISE was two years younger than SUSAN, and the little slave girl was given to her from her birth, for a maid. A wonderful attachment sprang up between the two children from the first. As babies, they were only happy when together, and this affection deepened as they grew to childhood and girlhood. Your father told me the whole history of his sister, and of her strange love for SUSAN, a long time ago. She was made for love, and the world is unkind to such. From what I learned, I believe that her only happiness in this world came from her slave sister. She did not know that SUSAN was a slave, liable to be sold at any untoward change of fortune, till just before she died. The very day she died, she had a long, serious talk with your father; and, making him promise that he would use every exertion to free SUSAN, she gave him a diamond ring to be a perpetual reminder of his pledge. Colonel HEATHERSTONE had then just left college, and a month after went to Europe, and spent three years in a German university. That you know about, of course. Well, while he was absent, your grandfather's estate became so encumbered with debts, and such complications ensued, that SUSAN was sold to a New Orleans cotton planter. In New Orleans I first knew her, and by a strange coincidence I found that this relationship existed; and Col. HEATHERSTONE learned of SUSAN'S whereabouts at the same time. When your father returned from Europe all trace of her had been lost. It is a long story, involving more wrong and suffering than I care to detail. But, in short, I secured SUSAN the freedom which she lost through a villain, and by strange paths she was led into her brother's family.

"And now you wish to marry her?"

"I do. And why not?"

"I can give you no reason. But SUSAN will not relent from her determination. She will not marry you, and I sympathize in her decision. SUSAN cannot be happy in this world; it is too late for that. But, Mr. BRAYTON, I cannot understand papa's holding SUSAN a slave."

"She was bought by his agent, and after she came to the house and he recognized her, she showed no desire to be free, and he let the thing drift."

"Of course mamma does not suspect."

"No, and it is not necessary that she should. Better keep the whole thing from her."

"Yes, poor mamma; she has too much trouble already. She does nothing but worry from morning till night."

"And now, little girl, what are you going to do? Tell me your plans, and then I am off. I can give you but an hour. I am going to Europe as business agent for a New York house, and I had hoped to take SUSAN with me. If she will not go, then I shall be as content as possible to know that she is with you."

"We expect now to go to New-York. HOPE'S brother is here, and has persuaded mother to think that the best plan. I expect HARRY home in a day or two, and I think he will go too. There is nothing for a young man to do here. NED ARNOLD talks of a business partnership. He thinks his father's name will help them. I am ready for anything new, anything to help me forget the past."

"I think it wise, MAGGIE, for you all to begin over in a new home. You are young, and will be happy again."

"O, I could be happy now, if ALFRED were only here to go with us. Mr. BRAYTON, this uncertainty is dreadful."

"Poor HOPE."

"Yes, poor HOPE? My heart aches for her. But she is stronger than any of us. It will be so sweet to have her with us, and NED promises that if we go to New York she shall give up her school in Chicago, and that we shall all be together."

"SUSAN will go, of course. But what of HANNIBAL?"

"O, we couldn't do without HANNIBAL. We have had too many losses to lose him. He will go with us; and we shall hope that you, too, will be in our vicinity very often."

"GOD only knows where I shall be. I shall be satisfied if you are all safe, and I can know of that, and that you are still together."

Mr. BRAYTON had only time for hasty greetings, before the final parting with the old HEATHERSTONE home. SUSAN refused to see him again. She had been too long among the billows to willingly give up the little peace she had gained, for the questionable pleasure of a farewell, and so when her lover left her forever, she did not even allow her eyes to follow him. Two days after BRAYTON'S departure, HARRY came home.

"O, MAGGIE! MAGGIE!" said the happy boy, after the first greetings were over, "I can ask nothing more, now that I have you in my arms once more."

"Yes, you will ask many things more," said MAGGIE, with a little of her old archness; "you'll be asking for your dinner within fifteen minutes."

"Bless the darling, she's herself after all this cruel suffering. Be as saucy as you please; I shall never scold you again."

"Now don't be rash, Sir Knight! But let me tell you about NED ARNOLD'S plans for all of us, you included."

When the long story was told, of all that had happened, which, indeed, took some days, interpolated, as it was, with tears and kisses, eating and drinking, and all subsidiary processes, HARRY agreed to follow the family to New York, and see what could be done to build anew their fortunes. He made one condition, however. This condition was explained one April evening, before the library fire.

"MAGGIE, darling, you must be my wife before we go to New York."

The sweet face rested on HARRY'S shoulder, and the lover tenderly smoothed the dark hair as he spoke.

"A modest request, HARRY, for a man who was never going to ask anything more."

"But a request that you must grant. No, MAGGIE; I expect to keep on asking as long as I live. You are my summer, and by the necessity of your nature, must always give to me."

There was considerable more of this sweet talk, but the result was a complete surrender on the part of the little make-believe rebel, and immediate preparations were taken for such a step as would make future secession impracticable, to say the least.

MAGGIE deserves to have a whole chapter given to her wedding. Probably she would have, if the HEATHERSTONE fortunes had not been so low at that critical time. And then poor ALFRED'S fate was so uncertain that all brilliancy was out of the question, even if money had been plenty. The affair could not be otherwise than sad. There were too many ghosts about, ghosts of past days and dead hopes. So MAGGIE'S wedding must be described in a few words, for there was really little to describe.

She was married on a sunny Sunday afternoon, when the blue April sky was full of promise for the coming summer. She wore one of her pretty home dresses, one that she had often danced in, in days gone by, but that had been put aside for the dark garments better suited to her sorrows. Rich old lace softened the outlines, and gave something of the quaint magnificence that in better days would so well have suited our beautiful MARGARET. Her mother's bridal veil fell over her dark hair, and mingled with the folds of her simple attire. So she was given to HARRY, with NED and HANNIBAL and SUSAN for witnesses, and the sad mother, who sobbed as the ceremony went on, at the broken promises of her own bridal.—[To be continued.

INNOCENCE.—What a power there is in innocence! whose very helplessness is its safeguard; in whose presence even Passion himself stands abashed, and stands a worshipper at the very altar he came to despoil.—*Moore.*

AN EASTER LILY.

BY BERTHA SIBLEY SCRANTON.

PALE, pale as any fair annunciation lily.
With head drooped on the breast;
As flower that 'neath the night dew, trembling, white and stilly,
Leans on the earth for rest.
Thus, smiling, passed she into GOD'S great resurrection,
A lily in her hand,
No more to learn life's woe, its pain and its correction,
No more to understand.

For her there dawneth ever, one white Easter morning,
That knows nor noon nor night;
No pleading litanies, no tapers for adorning,
The Lamb, there, is the light.
No chariot of surpliced priest, no choir's thrilling vesper,
No solemn pealing bell;
"Is it *well* with the child?" they ask us, and we whisper,
In meekness, "it is well!"

EVERY-DAY LIFE.

BY LEAD PENCIL, ESQ.

I HEARD JOHN WEISS preach yesterday. I rather like his Positivist idea of GOD in Humanity. There is a great deal of need that there should be such recognition on the part of those who have to do with Humanity. It seems to me the tendency is too much to concentrate all conception of Divinity in a single personal being, and to overlook the Divine nature of man. For instance, there is too eager a search after men's foibles. We are all of us apt to flippantly say, "He is a good fellow, but——" Or, "She is a handsome, accomplished woman, but——" and so on. How little looking after the kernel, the germ, the regenerative, the vital, the Divine force of each other's characters! Why? Aye, why? Can any one answer? I believe in the Divine! I believe in the Divinity of Man! I believe in the Divinity of Nature! I feel its power whenever I look into a human's eyes! I know that it ebbs and flows with every throb of the human heart! I know it gives vitality to all life! If not, what does? And if this is not Divine, what is? And if it is Divine, why should we not look for it where we can best see and understand it—here, right close to and about us, in these kindred souls that lean upon, live in and work for and with us? Can any one tell me why not?

Thanks, JOHN WEISS, for boldly uttering such humane and Divine doctrines!

Worry, worry, worry! Fret, fret, fret! It is sad to see men and women spending their lives in unrest. I mean that they lose their vitality and restfulness in anxiety and nervous apprehension lest the whole world shall go wrong if they do not watch it diligently. And they take every opportunity to communicate their anxiety to others. They lapse into a chronic soliloquy or wail over their own sins and shortcomings, and over the degeneracy and go-to-the-devil tendency of all mankind, but do not change their own sails one whit, nor do aught but whine over others.

One of these came to me the other day with the whole moral law, full length, on the end of his tongue. I said,

"What have you *done* to-day that makes you feel yourself better than you were this morning?"

"Alas! nothing," he replied.

"Then pray keep your lips closed and your tongue still until you have done something that will cause you to respect yourself; for until you do I cannot respect you."

That man has not spoken to me since!

IT is natural and charitable to cover up with the clods of the valley the sins of those we bury, and seek in their record the good and true deeds they have done, and emulate them. It is well. I often think that some men place the pearls which their friends have to hunt for, in an awful black setting, where they show the better by contrast, but are very minute at the best. But I do not object to this practice of proclaiming the best of any man or woman. It is always evidence to me that the bad in a man is seen and condemned by his most partial friends, when I find them selecting his good qualities to praise. They evidently know wheat from tares, and appreciate it. So I regard it an index of a healthful condition of the body politic—that upon the death of a man, his good qualities are all his best friends desire the world to remember.

"You sit as GOD, holding no form of creed," I overheard a lady say to a gentleman with whom she was conversing earnestly in the cars.

"No; I sit as *man*, believing what is, doing what is to do, ready to learn the truth, but not willing to shout Eureka! and shut my eyes to all that may follow. I cannot comprehend the merit there is in professing a blind faith, or in asserting that 'what I believe to-day I shall always believe'—in other words, assert the infallibility of myself or my teachers, or both; for, alas! I have proven these teachers and myself to be so fallible!"

And so they went on—the one the representative of Faith in Abstractions, the other of Faith in Works; the one struggling to *believe* right, the other to *do* right.

Which was nearest Heaven?

MONASTERIES IN ENGLAND.

AFTER a suppression of three hundred years, monastic life has revived again in England, and its spread is one of the most remarkable signs of the times. Under the spirit of religious toleration the various ancient orders of monks, the Benedictines, Dominicans, Capuchins, Augustines, Cistercians and others have established themselves in various parts of England, and have evinced the ancient aptitude of the Roman Church for securing choice localities. One of the most noted of these modern English monasteries is that of Mount St. Bernard, in Charnwood Forest, Leicestershire. It was begun in 1835, and for some time there were only five monks, who lived on a little farm and tilled the adjacent land. In 1842 the present extensive abbey buildings were commenced. They are in the plain, early English style, but with the church, cloister, chapter-house, refectory, dormitory, guesthouse, lavatory, kitchen offices, etc., with massive walls and buttresses, long and narrow windows, high gables and roofs, with deeply arched door-ways, the pile presents an imposing appearance. A clock-tower with a chime of bells remains to be added. The monastery owns now three hundred acres, nearly all of which is highly cultivated. The labor is all performed by the monks, who have made the domain profitable, selling the farm produce at a good price. The lives of the recluses are toilsome and abstemious. They are not allowed to speak to each other except in the presence of the superior; they eat no meat or animal food except milk and cheese; their daily round is toil, prayer and sleep. They work on the farm, feed the pigs, make the butter and do their own washing. No woman is permitted to enter the sacred ground. They have made a garden of the three hundred acres. Attached to the abbey is a reformatory institution for boys. The order is the Cistercian, a branch of the Benedictines; and three hundred years ago this order had one hundred and ten monasteries in England, the remains of which are now among the most picturesque ruins in that land—Tintern, Netley and Fountain abbeys among them. Is the old round to be run again?—*Hartford Courant.*

SINGULAR CAUSE OF THE DECREASE OF PEARLS.

MR. FRANK BUCKLAND writes in Land and Water: In passing over Mogbridge, near the junction of the rivers Black water and Conner, Sutherlandshire, Scotland, a gentleman who was with me told me that that part of the river we were then crossing was once celebrated for the number and quality of its pearls, but of late years they have diminished both in quantity and quality. The reason assigned for this was remarkable; according to the local theory, "the building of the bridges diminishes the number of pearls in the river." In former times bridges were not very numerous in Scotland, and the cattle passing the rivers by means of the fords, trod upon the mussels, and so injuring their shells, causes them to form pearls. After the bridges were built the cattle no longer went across the fords, but over the bridges. The mussels not being any more injured, ceased to create the pearls. There was formerly an old man at this place who gained his living by collecting these pearls. The poor fellow was blind, but nevertheless he continued his occupation as pearl-catcher. He used to wade into the river and pick up the pearls off the bottom with his toes, his wife standing on the bank, telling him in what direction to go. When he had filled a bag that he carried round his neck, with the pearl mussels, he brought them to the bank for his wife to open. A pearl the size of a pea was worth £1. I was very sorry to hear of the very tragic end of this poor man. He got out of his depth, fell into a deep hole in the river and was drowned.

Ladies' Port-Folio.

THE FAMILY CLOCK.

BY MARY WILEY.

STATELY in you corner stands,
With honest face and busy hands,
The family clock—for years has stood,
In self-same tone and changeless mood,
Ticking on,—through every change,
Heeding naught—however strange.
Ticking on through grief and mirth,
Ticking on through death and birth;
Ticking, ticking, night and day,
Ticking, ticking time away.

Never hasting, never resting,
Naught thy diligence molesting;
Through winter's gloom and summer's shine,
Attesting still the flight of time.
Telling high and telling low,
Telling all who come and go,—
Life is short, and time is fleeting,
This alone thine only greeting.
Ticking, ticking, night and day,
Ticking, ticking time away.

Years agone—in infancy,
A thing of life thou seemed to be
Hushed me into silent wonder,
Left my infant wit to ponder
As loud and clear, from day to day,
I heard thee toll the hours away.
In childhood's years I scann'd thy face,
And learned thereon the hours to trace,
Questioning if from elf or fairy
Came the tone that would not vary.
Ticking, ticking, night and day,
Ticking, ticking time away.

Drifting out of childhood's years,
Changing oft from mirth to tears,
Were we sad or were we gay,
Silently time flew away
And left me here—how many gone!
Ah, left me here, almost alone,
With memory filling heart and brain
So full of weary, aching pain;
While thou'rt still ticking night and day,
Ticking, ticking time away.

Bainbridge, Pa., 1872.

MY AUNT DOLLY AND HER JOURNAL.

FROM a child I had a vague and wondering admiration for my Aunt DOLLY. *Dorothea*, GOD'S own gift, she was named by the holy man who wet her baby brow with baptismal water; how strange it seems to me now that *she* could ever have been a baby. But she was a baby, and after that she was a little girl, and her brothers and sisters would never take kindly to that long Greek word, *Dorothea*, and so clipping it down and making it liquid, after the manner of childhood, she became DOLLY, and grew up with that name and carried it away from that old north parlor where she lost her other name, and wore it through the industries and bustle of young womanhood, and was crowned with it when she began to wear caps and to merge into that long, serene afternoon of life that began at forty, and lasted without cloud or gust or chill till the hair under her cap border was frosty and she had numbered her three score and ten.

Dear old Aunt DOLLY! She saw but little of this world, as we count world-seeing now. But those clear, dark-blue eyes—what unerring insight was theirs. How mildly, yet with what absolute precision did she look at men and women, and read their thoughts, and measure their capacities, and feel their tempers, and watch their paths through the world. Aunt DOLLY was one of those notable housewives that always have time for everything. The questions of BIDDY in the kitchen, of cheap Chinese labor, of patent churns and dish-washers, and bread-workers, how little did they worry her! Heroic Aunt DOLLY! With what force, and clearness, and method did she fly at the morning's work; how exactly did every movement tell on the final result; what a quick, deft grasp was that; saucers never slipped from her cup-towels; hot water never cracked her glasses; her strawberry preserves did not "work" and push the lids off her jars. Such currant wine was hers; such blackberry cordial; such quince preserves; such mottled cheeses; such golden butter! I suppose there are one thousand—yes, ten thousand—just such housekeepers now, only we never hear of them. What history have we of the millions and millions of honey bees that, following nothing but their own GOD-given instincts, built their cells with a wisdom and an accuracy that Sir ISAAC NEWTON could never equal, and filled them with such delicate amber, nectarine fluid as no retort or alembic of chemist can compound. So in ten thousand houses home work is planned, carried through, accomplished; chemical operations are conducted with a right-handed skill and precision that would make the reputation of a state laboratory. But these chemists of the bread bowl and the cheese vats have no newspapers to sing their encomiums, no bulletin to praise their victories. GOLDSMITH has not swathed their memories in the fine-twined linen of his unmatched English; COWPER has not immortalized their skill and hallowed their trivial perfections with his deathless singing. But my Aunt DOLLY was a notable exception to these nameless heroines of the hearthstone. Now that she is dead, and her works appear to be ended, we find that she has made a long and effectual protest against the on-coming of the oblivious wave that threatens to engulf all industries of women, from "Cleopatra's Needle" to "Uncle Tom's Cabin." In short, my Aunt DOLLY kept a journal. I have said that she was a housekeeper who always had time for everything. By nine o'clock of a summer's morning, the milk pans were scalded and laid to sun, on a bench in the back yard, the breakfast things were on their appointed shelves, and the closet windows were darkened; the dead leaves on the rose bush by the east door had been picked off, her geraniums had been watered, she had strolled through the garden and pulled the few sprigs of white clover and purslane that dared show their heads between her carrot rows, and coming back through the south door, she had clipped a red rose bud, and stepping into her bedroom, had hung the black lace cap on its regular nail at the right of the mirror, and from the second drawer had taken out her white lace cap and the triangle of bishop's lawn and fitted them—the cap strings with just such a bow, and the lawn with just such a fold, and set the rosebud in the acute angle where the lawn folded, all in less time than it has taken me to write these two score words with which I try to describe her simple toilet. So, when she stepped out from that little north room, she heard nothing but the regular click clack of the old eight-day clock, and the purr of the family cat on the door mat, and the droning of two blue flies that felt themselves to be miserable intruders the moment my Aunt came in from the garden.

Nine o'clock and the work all out of the way in that notable fashion what did my Aunt DOLLY propose, and how did she spend those three hours before noontide? She would go straight to the south parlor and take her pen from behind the looking-glass, and from the cupboard on the right of the fireplace she took out her Journal, and for two hours, till it was time to light the fire and pare the potatoes, *she wrote*. How glad I am, how glad all her nieces and nephews and cousins and three or four score thousand more, perhaps, who may read extracts from the journal of this noble and gifted old lady, how glad we are that she consecrated those two or three hours to us and to mankind. I will not probe into that kindly heart to feel for the motives that prompted her to such literary industry. She abhorred gossip, but who is not interested in human nature? And as she would never talk of the faults of her neighbors, she took a harmless pleasure in setting down what she observed of society as she saw it, of the young men and young women that sang in the village choir, that paired off for sleigh rides in winter and for pic-nics in summer. She was much stirred in her mind when men of mark came across her path, some Beamerges of the pulpit, a famous editor or a business man whose combinations took in many cities. Besides these shrewed observations on men and women and the secrets of success, my Aunt has set down a great many most valuable hints and rules and cautions in the housekeeper's art; she quoted the words of an Apostle for her thrift, and was resolved to try all things and hold fast that which is good.

This journal of hers is a rich legacy. I am more grateful to her than if she had left me all her silk dresses, and her furs, and her Paisley shawl, and all the furniture of that south parlor. Take, for instance, as a taste, this wineglass of good thinking on the true sphere of woman. It is a finger long on her page, and worth for me at least a bound volume of the Revolution:

"The proper mission of the wife and daughter is to foster all the courtesies and charities of life. Whatever makes existence dear and sweet, belongs peculiarly to woman. Man hungers for power; he thirsts for conquests. Woman hungers for home life; her gentler spirit thirsts for love. He gives form to society; she gives soul. She can be more than a legislator in her proper and natural sphere—the one she has filled from the beginning of time—she can make the law-makers. We delight evermore in our fancies to paint woman bending in tenderness over the cradle, nurturing in her sons and daughters every noble motive, holding up the hands of her husband in brave battle with adverse fortune, dispensing gracious hospitalities, ministering to the poor, the sick and unfortunate, always bearing about her an atmosphere of winning grace and gentle firmness in the right; and breathing words of charity which covereth a multitude of sins."

Reading for the Young.

"HAPPY-GO-LUCKY."

HAPPY-GO-LUCKY has cheeks rosy red,
Ten times a day he will stand on his head.
Happy Go-Lucky is brimful of fun,
Up in the morning as soon as the sun,
Sliding on banisters, all the way down,
Playing at circus and bumping his crown.
When he has shocked all the house with affright,
Off he goes, screaming with roguish delight.

Happy-Go-Lucky once climbed up a tree,
Just to look round and see what he could see.
Crack went the bough! Such a terrible fall!
Didn't hurt Happy-Go-Lucky at all!
May-be the fairies, with some potent charm,
Because he's so cheerful, have kept him from harm.
Mother so wishes that he would be still,
Only for once; but the rogue never will!

Happy-Go-Lucky runs out in the streets,
Asks in to dinner each beggar he meets;
Happy-Go-Lucky—now, just think of that—
Tied granny's spectacles on the poor cat!
When he knows mother is going to scold,
Up he trots gravely, in tears, I am told;
Then he will kiss her and hug her with joy.
Any one got such an out-and-out boy?

[*George Cooper.*

A PLEA FOR THE LITTLE ONES.

I'M not so sure but a Mr. BERGH is needed to go into families, and prevent cruelty to children. Surely the cruelty exists.

The tradition is, that step-mothers are the only ogres in the family. This is a curious mistake. These, often from the bad name which precedes them, are the most zealous to be just to the children who have come under their charge. But it is of parents, more especially, of whom I now complain.

Fathers and mothers are often most cruel to their offspring; and the tortures are as varied as those of the inquisition. The mind of a child is acutely sensitive. We hear much of "careless, happy children." Who hears of the sharp suffering a child may feel? Yet, if we reflect a moment, we will remember by our own experience that they suffer as keenly as they enjoy. Don't we remember slipping into the creek, and then spreading our wet stockings on the bank in the sun to dry, while we sat beside them in utter wretchedness because of the reproof we would get when we reached home? Do we not remember when the privileged nurse slapped us across the ears till they rang and burned, and called us a contemptuous name, and we went down in the cellar, and sat upon a potato bin as stiff and tearless as a stone, and wished we could kill her? Do we not remember the hour we had to amuse the baby seemed a year; and the nursery was a prison; and no convict ever chafed more under his chains? Then, when we were released, to have the freedom of the fields! How wildly we flew, with the sense of liberty and complete happiness. But soon, even as the wing of a bird droops, we tired, and sat down upon a stone, and wondered if there was not *something more*. Liberty did not satisfy our wants!

Do we not remember the task thoughtlessly given beyond the capacity of a child, and the dreadful sense of hopelessness that came over us on attempting to do it? And then we remember going home from school with a friend, without permission, to spend the night. And, while all the household were asleep, we lay in the darkness with eyes wide open, suffering because a wayward will had disobeyed a sensitive conscience. Ah, truly, children are only men and women in epitome! Their sensations are just as varied and keen as ours—far keener, because they have not yet become callous. We look to GOD to "temper the wind to the shorn lamb." Why are not people equally tender of the lambs under their own care?

There is much domestic despotism. The worst despots, of course, are weak, selfish, undisciplined characters. Some, also, are despots through mistaken notions; others through ignorance. Many want their children to bow servilely, and without question, to their every mandate, be it ever so whimsical. Any opposition shows will; so that will must be broken. They strive to break the will, and succeed only in breaking the temper, and almost breaking the heart!

Some aspire to have their children good and quiet, like mummies, and make them prisoners. Others wish their offspring to be "smart." They crowd, and crowd, and crowd them until knowledge has not a zest, it is only so many chips to be piled in the store-house. They cannot assimilate when laboring to stuff, so they wearily crowd.

Many torture the little ones by wounding their pride. They tell their faults to others to *shame* them out of them. An outraged feeling possesses the child, and he thinks he will never again attempt to do right. Says the mother, "Oh, Aunt SUE, you don't know what a *bad* boy he is; some day he will be taken to an asylum as a lunatic, he gets in such a raging passion." The mother sighed, the child looked abased. He said not a word, but by-and-by, when Aunt SUE, whom he loved, was alone, he crept up to her and put his arms about her neck, and wept, and said:

"Oh, Aunt SUE, *she* don't know how I *try* to help it. The other day I prayed to GOD to help me keep my temper, and He did until to-day,—I guess He forgot about me to-day. Don't you think you could go to the druggist's and get me some medicine to *keep off the mad?*"

A child is insubordinate, and the parent would rob it of its toys, its treasures, (and so, of its individuality,) as a punishment. The boy questions her right. "You and your toys are mine until you are twenty-one," said the mother. The child was silenced. He thought, "How long to wait for liberty; until twenty-one!" Suddenly a thought struck him: "But if you have a right to me, why haven't I a right to you?" So some persons take the self-dependence and self-respect from their children.

I have seen people watch with most sedulous attention, the temperaments, habits and wants of the plants in their windows, while they treated their children either as puppets to amuse them, or as objects of spasmodic caresses, or as victims of their despotism.

There are those who treat their animals with the tenderest care, while others treat theirs with systematic cruelty. Happily, most parents are instinctively what they should be. Unhappily, others are sellishly, ignorantly cruel to their offspring. It is only for the latter class I suggest the supervision of a Mr. BERGH.

There is a steadfast, patient love that can look beyond a personal ambition—beyond a love of ruling; beyond the child act to the child motive; beyond even the child motive to the physical, mental and moral constitution which those parents have entailed upon the child. Truly, it takes wisdom to be a true parent; a wisdom from on high.

The latter was wounded..The King of Italy has sent a private minister to M. Thiers on the Roman question.

Report on the Northern Pacific Road.—The ease and regularity with which the trains of the Northern Pacific Railroad can be run over its entire length throughout the hardest winters, and its greater freedom from the natural obstacles that have delayed the other Pacific routes, is ably illustrated in the concise report of Mr. W. M. ROBERTS, Engineer-in-Chief of the Northern Pacific Road. The report gives satisfactory evidence that this great highway to the Pacific will be the most successful of all competing routes, and that there will be as little danger of delay in travel during the severest months of winter as there is on any of the New York or New England roads. The high character of Chief Engineer ROBERTS will stamp his report with confidence wherever it is read.

Lives there a man so ignorant as not to have heard of our $75 Four-Ton Hay Scale. The JONES SCALE WORKS, Binghamton, N. Y.

Never get a poor farm implement. Get the best. Get the Blanchard Churn.

The following is from General PORTER, President GRANT's Private Secretary:

EXECUTIVE MANSION,
WASHINGTON, D. C., Oct. 13th, 1871.

DEAR SIR:—My watch has kept excellent time since I have carried it. Yesterday, in some unaccountable way, the crystal was broken. Will you please replace it, and oil the works?—they have never been oiled or examined since the watch left the factory. I expect to be in New York a day, about Thursday or Friday of next week, and shall call at your place, 13 Maiden Lane, for the watch. Yours very truly,
(Signed) HORACE PORTER.

F. A. GILES, Esq.

The watch referred to above is No. 27,335, Stem Winder, Trade Mark "John W. Lewis—manufactured by the United States Watch Co. (Giles, Wales & Co.), Marion, N. J.," and has been carried by Gen. PORTER for over a year. We are glad to see that our officials in high places appreciate fine American mechanism, and set the example of patronizing home productions, instead of sending our gold abroad for inferior articles.

SPECIAL NOTICES.

RUPTURE CAN BE CURED

without suffering. ELASTIC TRUSSES are superseding all others. Before buying Metal Trusses or Supporters, send for a descriptive circular to the ELASTIC TRUSS CO., No. 683 Broadway, New York.

THE MARKETS.

MONEY AND TRADE AFFAIRS.

NEW YORK, Saturday, March 9, 1872.

SINCE our last report the Secretary of the Treasury has published his March Schedule of the Public Debt of the United States. The decrease in the Principal of the Debt since February 1 is $12,391,000. The present Schedule closes the third year of the Administration of President Grant. The total decrease in the Principal of the Debt is $220,649,000, and the reduction of the Gold Interest charge on the Funded Stocks is $16,900,000 per annum. There is also a saving of $1,250,000 a year in the Currency Interest, on what are known as the Three Per Cent. Legal Tender Certificates. The following is the present classification of the Funded Stocks:

FUNDED (GOLD) STOCKS, UNITED STATES, MARCH 1.

Date.	Coupon.	Registered.	Total.
5-20s, 1862	$305,838,550	$41,678,800	$347,517,150
5-20s, 1864	40,616,150	43,158,850	83,805,000
5-20s, 1865	120,120,350	42,077,350	162,860,700
5-20s, 1865, (new)	165,732,100	63,841,100	229,636,200
5-20s, 1867	222,295,450	91,079,800	330,975,250
5-20s, 1868	26,352,000	12,911,000	39,263,000
Total 5-20s	$883,116,400	$235,952,900	$1,181,069,300
Sixes, 1881	91,450,000	192,251,200	283,681,200
Fives, 10-40s	66,475,400	138,091,900	194,567,300
Fives, 1874	13,055,000	6,045,000	20,001,000
New Fives, 1881	50,351,450	117,480,950	167,832,400
Total	$1,100,328,250	$749,821,950	$1,850,150,200
Total March 4, 1869			2,007,846,150
Reduction of Funded Debt			$257,695,950
Yearly Gold Interest charge, 1869			124,255,350
Present yearly charge			107,294,889
Reduction Interest Charge			$16,960,670
Reduction in Funded debt as above			257,695,942
Reduction of Treasury Circulation			41,953,812
Total payments on Debt			$220,649,762

Money keeps in demand at full 7 per cent. at Bank, for Discounts, and in Wall Street on Stocks. Merchant paper not accommodated at Bank, sells on the Street at 8@10 per cent. discount per annum. Trade is active and generally prosperous. The Importers are doing more than in any previous spring season, and the Domestic Manufacturers are meeting a good market, especially for Cotton and Woolen Goods. The Cotton receipts continue to fall off from the figures of the previous crop, and singular to say, prices weaken as the receipts go down. This may be accounted for, perhaps, from the excessive speculation for future delivery earlier in the season.

The temper of British opinion on the Washington Treaty is less angry and decidedly more rational, and the London Exchange has recovered its equanimity, as well on the American Funds, as on Consols, &c.

There is nothing new of Tariff or Financial legislation at Washington. Whatever changes are made in the Tariff, will be made to go into effect after 3 or 6 months notice.

The following are the comparative movements of the City Banks for the past fortnight.

	Feb. 24.	March 2.
Capital	$87,155,500	$87,155,500
Loans	282,485,700	282,280,100
Gold and Greenbacks	62,503,700	62,101,000
Deposits	213,328,200	210,472,800
Circulation	28,143,700	28,165,400

PRICE OF STOCKS AND BONDS.

American Gold	110¼	N. Y. Central Scrip	91½
U. S. 5-20's of 1867	112⅜	Reading	114¾
U. S. 6s of 1881	115⅝	Rock Island	114
U. S. 10-40s, 5 ₱ cts	*108	N. West	78¾
U. S. New Loan	109	Do. Preferred	92¾
N. Y. Bounty Loan	107	St. Paul	59

Virginias, new	55½	Lake Shore	93¼
Missouri Bonds	91¾	Ohio and Mississippi	45¾
U. S. Currency 6s	114½	Toledo & Wabash	76⅜
Central Pacifics	102¾	Erie	90¾
Union do	92	Union Pacific Stock	36¾
Western Telegraph	70¾	Adams Express	94
Pacific Mail	62	American Express	70
N. Y. Central Stock	90⅛	United States Exp's	63¼

* Ex-Dividend.

The changes from our last table of quotations are in favor of the Government Stocks ½ per cent., and in favor of the Railroads and speculative miscellaneous Shares like Pacific Mail and Western Telegraph from 2 to 3 per cent. The advance in Erie Stock, supposed to grow out of the prospect of Legislation against the JAY GOULD Ring, at Albany, is nearly 4 per cent. The price of Gold has varied very slightly and is ¼ per cent. higher than last week. The Express Stocks are all very strong on the active Spring business of the Companies. They are 1¼@2 per cent. higher than on our previous table. The general market has been, and is yet, unusually active, and the amount of business done on the Exchange larger than at any time since early in January.

PRODUCE AND PROVISIONS.

NEW YORK, Friday, March, 8, 1872.

Receipts.—The receipts of the principal kinds of produce since our last embrace 12,646 bales of cotton, 231 pkgs. dried fruits, 4,625 bbls. eggs, 32,908 bbls. flour, 67,900 bush. wheat, 264,700 bu. corn, 35,900 bu. oats, 13,735 do. malt, 36,369 do. barley, 8,520 sacks grass seed, 911 bbls of beans, 1,116 barrels of corn meal, 2,851 bags do., 283 bales hops, 5,262 pkgs. pork, 197 pkgs. beef, 12,210 pkgs. cut meats, 13,631 pkgs. lard, 917 kegs do., 9,481 pkgs. butter, 4,176 pkgs. cheese, — dressed hogs, 1,859 bags peanuts, 616 hhds. tobacco, 2,879 boxes and cases do., 4,919 bbls. whisky, 1,074 bales wool.

Butter.—There is a most agreeable surprise in the turn that butter has taken, after some of the early croakings that can be remembered. There is no improvement as yet to note in prices, nor do dealers desire to press for more money than is quoted, fearing that an advance would interfere with the steady stock-reducing trade that has set in. If the activity continues, we shall be in a much better shape for new butter than at one time during the past winter we had reason to expect. Of course, there are many lots of extremely low grades that must go to grease, being completely unfit for our city or near-by trade; but the sacrifice of those hopeless parcels will be willingly submitted to, if we can only keep a movement that will work off the body of daily receipts and the useful surplus in store. Exports for the week, 151 firkins. State dairies, fine, 30@31c.; State dairies, fair to good, 26@28c.; State, half-tubs, good to fine, 32@35c.; State, do., common to fair, 24@28c.; State, firkins, fine yellow, 28@30c.; State Welsh, good dairies, 28@31c.; State do., common to fair, 22@25c.; State do., fresh made, 32@33c.; State, fancy select tubs, 34@38c.; Ohio, good, 18@20c.; Ohio, Central and Southern, 14@17c.; Western, choice yellow, 20@21c.; Western, store-packed, 9@11c.; rolls, good West, 18@20c.; rolls, common to fair, 13@16c.; grease butter, 9@9½c.

Beans and Peas.—The arrivals of beans are small and the market is in a more encouraging position. Mediums have advanced, and marrowfats are working a little more in the seller's favor in sympathy, Pea beans are a trifle higher, with an insufficient supply of choice. The demand for kidney is improving. Canada peas are coming in more freely and lower prices are offered. Southern blackeyed are higher, with moderate supplies. Prime mediums, $2.30@2.65; good do., $2.30@2.45; fair do., $2.10; inferior do., $1.25@1.50; pea, $2.80@2.90; kidney, $3.10@3.25; red kidney, $2@2.25; prime marrowfats, $2.90@3; common lots do., $2.25. Canada peas in barrels, $1.25. Green peas, $1.30@2. Southern blackeyed, per two bushel bag, $3.

Beeswax.—Small sales Southern at 35½@36.

Broom Corn.—There are fair arrivals, and the market is weak. Sales at 7@9c. for new hurl; 5@6c. for new green; 3@5c. for new red; 3@6c. for old do.

Cheese.—The market is very much unsettled and decidedly higher. There is very little coming in, and speculators have been at work buying up pretty generally. Shippers are not able to pay the prices now asked, and the home trade buy only as they have occasion to use. We understand at the close 18¾c. was refused for a prime lot of factory. Some shippers who bought and held, in anticipation of the advance, are now offering their supplies freely, being quite well satisfied with the profits already secured, but regular holders are indifferent, and working with the impression that the maximum has not yet been reached. The shipments for the week were 178,000 lbs. Quotations are for State factory, fine, 18@18¾c.; fair to good do., 16¾@17¾c.; ordinary, 14@15c.; State farm dairy, good, 15@17c.; do. common, 10@13c.; Vermont factory, 16¾@17c.; Ohio factory 15½@16¾c.; English dairy, 14@16c.

Cotton.—The market has been subject to frequent fluctuations. A slow inquiry and depressed markets at other points, created a decline of ⅜c. immediately subsequent to our last; but later, an improved market in Europe and an increased speculative inquiry, to fill short contracts, brought prices up pretty nearly to their old point. At the close the market is off again a fraction, and there is an uncertain feeling. Orders from the South have been moderate. We quote:

	Uplands.	Alabama.	N. Orleans.	Texas.
Ordinary	19⅞	19⅞	20⅛	20⅛
Good Ordinary	21⅛	21⅜	21⅝	21⅜
Low Middling	22	22⅛	22⅜	22⅝
Middling	22⅝	22⅞	23	23¼
Good Middling	23⅝	23⅞	23⅞	24

For forward delivery the market is weak. The sales, on the basis of low middling, are as follows:—April, 22⅜c.; May, 22⅝c.; June, 23¼c.; October, 20c.

Eggs.—Supplies are well sold up, but to bring this about receivers have been making concessions freely. There is a feeling of uncertainty from day to day as larger arrivals may at any time come upon the market and force a severe break. The late cold snap caused some stock to be frozen, and we have the last day or two scarcely enough fresh in to meet the ordinary calls from the trade. The important concessions made brings a better inquiry. We append prices obtained to-day, but they are likely to change any moment. Western at 30@32c.; State, 33@34c.; Pennsylvania, New Jersey and Long Island, 31c.

Flour.—Absence of demand has weakened the market, notwithstanding the arrivals have been remarkably light. The foreign market is depressed, and there is a feeling of uncertainty which creates more or less disposition on the part of holders here to close out their supplies.

We quote at $5.50@$6.35 for superfine State; $6.55@6.75 for common extra do.; $6.80@6.90 for good to choice do.; $6.95@7.30 for fancy do.; $5.20@6.35 for superfine Michigan, Indiana, Ohio, Iowa, &c.; $6.45@6.75 for extra do.; $6.90@7.40 for choice extra do., including shipping brands of round hoop Ohio at $6.50@6.90, and trade brands of do. at $6.95@7.35; good to choice white wheat extras at $7.45@7.80; Minnesota, fair to very choice extra, at $7.00@8.50; St. Louis at $6.75@7.40 for common to fair extra, and $7.45@9.50 for good to choice. Southern at $6.80@7.65 for extras and $7.70@9.50 for good to choice. Rye at $4.10@5.05 for common to fine. Buckwheat at $3@3.60.

Fresh Fruits.—The market is dull, and prices but slightly changed.

Apples, good, barrels, $3.75@4; do. selections, $4.25; do. poor, $2.75@3; cranberries, common, bbl., $6@7.50; do. crates, fine, $4; do. do. common, $3@5.12; oranges, La., bbl., $4@5; peanuts, Wilmington, bush., $2@2.20; Virginia, new, $2@2.20; do. common, $1.25@1.50; hickory nuts, $1.75@2; Pecan nuts, ₱ 3@3½c.

Grain.—Business in wheat very light, and prices nominally lower. No. 2 spring in store, $1.50@1.53, No. 1 do., $1.54@1.55, winter red Western $1.62@1.69, amber do., $1.70@1.73, white Western, $1.70@1.80. Rye is inactive and weak; sales of Western at 83c. Oats are steadily held at 52½@55c. for Western and 54@56c. for white Ohio. Barley is dull and drooping; sales of four-rowed State at $1.08 and two-rowed State at 75c.; sales of two-rowed State malt at $1.

Hay and Straw.—No new features are noted in the market. Sales are chiefly to the home trade. Shipping hay is quoted at $1.25; retail qualities, $1.35@1.60, the latter price for strictly choice lots. Long rye straw $16@1.10; short rye, 85@90c.; oat, 75@85c.; wheat, 50@70c.

Hops.—Fine grades are in good demand from brewers at old rates. Other grades quiet. Stock small and prices throughout are firm.

New Yorks, growth 1871, 25@65c.; Eastern do. 1871, 25@60c.; Western do. 1871, 25@60c.; yearlings do. 1870, 10@30c.; olds do. 1869, 10@15c.; old olds do. 1868, 8@12c.; Californians do. 1870, 15@30c.; Californians do. 1869, 9@15c.; Bavarians, 75c.; English, 60c.; Belgians (nominal), 55c.

Provisions.—Prices of pork have declined about 50c. per bbl. New sold at $13.30, cash, and for forward delivery, at $13.25 for March; $13.50 for May; extra prime, $11.75; prime mess, $13.75 for new Western. Dressed hogs firmly held at 6c. for Western, and 6½@6¾c. for city. Middles have been sold less freely, and prices are lower; long clear, 7 3-16c., short do., 7¾c., bellies, 7¾@7¾. Cut meats in moderate demand at 8½c. for hams in pickle; 8¾@9c. for do. in salt; 5¼@6c. for shoulders; 9½c. for long cut hams. Smoked meats at 10@13c. for hams; 6½@7c. for shoulders, and 8@8½c. for clear rib. Lard is offered at lower prices; prime Western steam, 9 5-16c.; good do., 9¼c. Sales of prime for April, at 9 7-16c.; for May, 9¾c.; for June, 9 11-16c.; city at 9¼c. for steam. Beef is rather in the buyer's favor. Plain Western mess, $9@10.50; extra mess, $10.50@12.50; tierce beef, $15@17 for prime mess, and $19@21 for India do. Beef hams are steadily held; Western, $23@26. Stearine quiet at 9¾@10c. for prime. Tallow dull and weak; prime offered at 9¼c.

Poultry and Game.—The demand is moderate. Turkeys, Western, good, 16@18c.; do. poor and frozen, 12@15c.; do. State, 17@18c.; do. Jersey, 20@21c.; Ducks, Western, 16@18c.; do. poor and frozen, 12@13c.; do. State and Jersey, 19@22c.; Geese, Western, 10@12c.; do. poor and frozen, 10@12c.; do. State and Jersey, 14@16c.; Fowls and Chickens—Western good, 15@17c.; do. poor and frozen, 12@14c.; do. State, 16@18c.; do. Bucks Co. and N. J., 18@20c.; capons, 25@28c. Fowls and chickens—Live, State and N. J., 17@19c. do. Western, 15@16c.; roosters, 10c.; ducks, per pair, 75c.@$1.50. Geese.—Western, $1.20@1.75; do. Canada, $1.75@2; do. Jersey $3@3.50; turkeys, 17@20c.

GAME.—Rabbits per pair, 35@45c.; hare do., 40@50c.; canvas backs $2, red head $1.25, mallard $1, widgeon and teal 35@40c.; black duck, 75c.; English snipe per doz., $4; squah per doz., $1; wild geese each $1.

Seeds.—The shipping demand for clover is falling off, but the supplies are small, and prices are steadily held. Sales at 9¼@9¾c. for Ohio, and 10@10¾c for Indiana and Michigan. Demand for Timothy is unimportant. Sales at $3.25@3.60.

Tobacco.—Market without animation. Most parties are disposed to await the effect of increasing arrivals of the new crop. A few lots have been taken by shippers to close out urgent orders. The home trade are buying only enough to carry them along. Trade in seedleaf is improving, with a fair assortment on sale. Foreign grades are selling in small lots only.

Vegetables.—Shipments of potatoes 3,300 bbls. of onions, 900 do. Potatoes are unchanged, the stock

continues to receive daily additions. Onions are feeling the shipping trade and are better.

Potatoes, Early Rose, bbl., $2.12@2.37; P. Blows, $1.75@2; Prince Albert, $1.75@2; Monitor and Goodrich, $1.25@1.50; Jackson, $1.25@1.50; Dyright, $1.25@1.75; Nova Scotia, $1.75. Sweet Del., $3.75@4.00. Onions, red & yellow, $1.75, white, $2.50@3; Conn., 100 strings, $2.50@3. Garlic, per 100 bunches, $20@22. Turnips, Russia, bbl., $1.25; flat, $1@1.25. Cabbages, per 100, $5@7. Hubbard squash, per bbl., $4; marrow, $4. Beets per 100, $1.25. Carrots per 100, $1.50.

Wool.—Business in fleeces is more restricted. The stock is so light that holders feel confident of being able to place their supplies at the high figures demanded. Buyers assert they cannot turn out manufactured goods at profitable prices with current quotations of wool, and are not buying much. The few sales making are at full asking figures. Pulled scarce and high. Foreign working more in the buyer's favor. Latest sales of Ohio and Michigan fleeces at 80@85c., as to quality; 65c. for medium unwashed; 54c. for extra pulled; 31c.@$1.15 for scoured; 35@41c. for full clip California; 33@35c. for burry do.; 38c. for California lamb's do.; 41@c. for medium Texas; 56c. for Colorado; 48@49½c. for Cape; 48c. for foreign.

Whisky.—Western is quiet at 90c.

ROCHESTER, N. Y., March 7.—Wheat very firm at an advance of 5@8c.; red winter, $1.55@1.60; white, $1.65@1.75, some sales at $1.80. Corn 70@72c. Barley, 65@70c. for two-rowed; 75@80c, for four-rowed. Beans, dull at $1.75@2.25. Dressed hogs, quiet at $6.25@6.50. Mutton, 7@9c. ₱ lb. Poultry scarce, 17@18c. for chickens. Butter firmer, 25@26c. for good. Eggs more plenty, 25@28c. ₱ dozen. Potatoes are scarce and higher, selling at 50@55 ₱ bushel. There are heavy losses in potatoes stored in the field this winter by cold weather. Grass seeds quiet. Timothy, $3.50@4; clover, $5.75@6.25. Fat sheep are worth 7@8c ₱ lb., varying with quality and weight of fleece. A severe storm has prevailed since Monday, and markets are generally poorly supplied.

LIVE STOCK MARKETS.

NEW YORK, March 8, 1872.

THE markets have generally been somewhat uniform during the past week, though the cold snap sharpened the appetite for meat, and trade was lively, at rather improved rates on most kinds of stock. Eggs have not been very plenty, while fish nearly always rules higher during Lent, thus turning the demand more upon meat, save so far as it is forbidden by those sects which always abstain during this period. It would seem, from the good demand, and the numbers of cattle, sheep and hogs sold during the Lenten season, that people are not as abstemious as they formerly were.

TOTALS LIVE STOCK FOR THE WEEK.

	Beeves.	Milch Cows.	Calves.	Sheep.	Hogs.
This week	6,250	126	889	16,373	25,024
Last week	6,508	205	795	16,661	27,851
Correspond'g w'k '71	4,571	82	567	17,094	12,742
Average, '71	7,187	88	2,301	25,132	25,177

Beeves.—In point of numbers we have about the figures of the previous week, but nearly 2,000 more than during the corresponding week of 1871. There was the full supply of 3,200 head on sale last Monday, distributed in former proportions among the different selling places, and all were disposed of. Prices scarcely varied from the previous week, and there were no special points of interest. Since then there have been regular arrivals, and a uniform trade, a few of latest sales being 81 Ill. steers, 7¼ cwt., sold at 12c.; 33 Texans and Canadas, 6@7¼ cwt., at 10@11½c.; 107 good Ill. cattle, 7¼ cwt., at 11½@13c.; 84 Mo., 7¼ cwt., at 11½c.; 48 Ill., 7¼@7¾ cwt., at 11½@12c.; 34 Ky. 7½ cwt., at 11½c., 57 ₱s per cwt.

A recent visit to the far West, where thousands of Texan cattle were kept through the winter, showed them in variable condition. Where hay was fed out, and especially where the partial shelter of forests or broken ground was afforded, the beeves look fairly, but those owners who undertook to carry their herds through the winter without food or shelter, the cattle are in a sorry condition, many of their carcasses strewing the plains. Important lessons have been learned by the past season's experience which will doubtless be of great advantage to herdsmen in future.

The following are the prices at the close of the market:

	This week. Cents.	Last week. Cents.
Choice bullocks, ₱ lb	12¾ @ 13	12¾ @ 13
Good to prime	11½ @ 12	11½ @ 12
Medium	10¾ @ 11¼	10¾ @ 11¼
Ordinary	10 @ 10¾	10 @ 10¾
Poorest grade	8¾ @ 9¾	8 @ 9
Average of all sales	11¼ @ 11¾	11¼ @ —

Milch Cows.—The supply is lighter, but is more than ample for all wants, and the low rates of last week are not improved upon. Common cows are very low, selling at $25@40 each; fair, $50; prime, $65@75.

Veal Calves.—There is a little increase in arrivals, and no change in prices, the cold weather favoring both the sending in and handling of hog-dressed veals. Live calves are worth 8@10c., as to quality, with dressed selling at 10@11c.

Sheep.—No special changes to note, arrivals being about on a par with those of the previous week. We give extreme prices, as 7@9¾c. There is, however, a stronger tone to the market. Latest sales are, 1 car 85 lb Ind. sheep, at 8¼c.; 1 car O. fine wool, 95 lbs, prime, 9¾c.; 1 car Ill., 83 lbs, 8c.; and 2 cars 90 lb do., 9¾c.

Hogs.—There is a little falling off in numbers, and no trade to note in live, all the hogs going direct to slaughtering firms. Live are quotable at 5¾@5¾c.; city dressed, 6¾@6¾c. for most weights, pigs reaching 6¾c.; Western dressed close firm at about 6c., some sales being at 5¾c.

WEBSTER'S PATENT
BUTTON-HOLE WORKER.

Patented June 27, 1871.

One of the most important inventions of the age! The most perfect Button-Hole Worker ever invented! So simple that a child can work a more perfect button-hole with it than the most experienced hand can work without it. Every stitch is taken with the most perfect mechanical accuracy. Is used entirely independent of the sewing machine, and will last a life-time. Does away with pricking the fingers, straining the eyes, and with imperfect and irregular worked button-holes. They give universal satisfaction. Ladies who use them say that they are worth their weight in gold. Over 11,000 sold during the first week of their introduction. The most liberal inducements offered to the trade. Dry Goods and Fancy Goods Merchants find it an excellent selling article. Local and traveling agents wanted everywhere.

Samples and terms, with full directions for use, sent prepaid on receipt of 50 cents. Orders by mail receive prompt attention. Address
GEO. DAVIS, Successor to
A. W. Webster & Co., 571 Broadway, N. Y.

The Nursery Favorite Safety Pin.
PATENTED 29th AUGUST, 1871.
BEAUTY, ECONOMY, UTILITY, SAFETY.
THE BEST AND MOST PERFECT PIN EVER MADE.
It takes 22 Inches of Wire to Construct One Pin.
IT OVERCOMES OBJECTIONS constantly made by those using other pins. Unlike them the wire is formed into a long and short spiral coil. The pin is pointed at the end and is of a triangular shape, which will allow it easily to penetrate one or more thicknesses of cloth. When confined, the sharp point is perfectly inclosed and secure, and cannot become loosened except by hand manipulation
THEY GIVE PERFECT SATISFACTION.
Liberal inducements offered to the Trade. Local and Traveling Agents wanted everywhere. One-half dozen pins packed in a neat little box and sent postpaid to any address on receipt of FIFTY CENTS.

GARIBALDI has been elected a member of the Internationals, and accepts with thanks.

SUPERINTENDENT GEO. W. MILLER has come into possession of a fortune of $270,000.

Paints, Oils, Blacking, &c.

ARE YOU GOING TO PAINT?

MORE THAN

100,000 HOUSES

HAVE BEEN PAINTED WITH THE

AVERILL CHEMICAL PAINT

IT IS THE BEST

In the world for exterior work upon Cottages, Villas or Buildings of any kind, whether built of brick, wood or iron. It is a liquid, *ready for use*, and requires no oil thinning or drier. Purest white, and any desired shade can be had in packages from one gallon upwards.

Letter Received from Levi Shaw, Trustee of the United Society of Shakers.

MT. LEBANON, N. Y., Sept. 27, 1871.

RESPECTED FRIENDS:—In reply to your inquiry as to what we think of the Averill Chemical Paint, we have used in our Society at Mount Lebanon some 1,000 gallons. We are very much pleased with it, and until we are convinced that there is something better, shall give it the preference of all other paints. We have used heretofore the (——), (——), and most all other brands of white lead, neither of which have given us perfect satisfaction. Most of it would chalk off after being on some two or three years. This, after three years' experience, we do not find to be the case with the Averill Pure White Chemical Paint. Indeed, it appears just as well as when first put on. I will write you again on the subject when I am not in quite so much of a hurry.

Sample card of beautiful colors, and recommendations from owners of the finest residences in the country, furnished free by the

AVERILL CHEMICAL PAINT CO., 32 Burling Slip, New York, or 118 Superior St., Cleveland, Ohio.

P. S.—The superiority of these Paints has already brought numerous *worthless* imitations in the market. We caution the public against using them.

IT WILL PAY TO USE
FRANK MILLER'S

ST. JAMES HOTEL,
NEW YORK.
ELIAS HOTCHKISS, Proprietor,
CORNER OF BROADWAY AND 26TH ST.

This is one of the Pioneer Hotels in its fine location—corner of Broadway and Twenty-Sixth St. It is kept on the fast-becoming popular European Plan, and is large, commodious and well-arranged in all departments.

Fertilizers, Etc.

TO FARMERS.—DOUBLE REFINED POUDRETTE of the "LODI MANUFACTURING CO." for sale in lots to suit customers. This article is sold for *half the price* of other fertilizers, and is cheaper for tobacco, cotton, corn and vegetables than any other in market. It is made entirely from the night soil, offal, &c., of New York city. Price, delivered on board in New York city, Twenty-five Dollars per ton. I ask attention to the following Testimonials:

ONEIDA CO., N. Y., Oct. 12th, 1871.—*Dear Sir:* For two years past I have used the Double Refined Poudrette for corn, potatoes and garden Vegetables, and I have realized on the first crop 100 per cent. for all the money invested. Yours truly, T. B. ALLANSON.

WINDHAM CO., VT., Dec. 4th, 1871.—*Dear Sir:* I think the Lodi Company's Double Refined Poudrette the best manure I can find for tobacco, corn and potatoes. I shall order a number of tons another season. Yours respectfully. E. S. HORTON.

JESSE VAUGHN of Lancaster, N. Y., under date of September 20th, says:—I applied the Double Refined Poudrette, last Spring, on corn and potatoes, and I believe I have the best corn in town, and my potatoes are an excellent crop. I have used your Double Refined Poudrette several times before, and always with good results, but this year the effect has been more perceptible than ever before.

A pamphlet giving full directions, &c., sent on application to JAMES T. FOSTER, 63 Cortlandt St., N. Y.

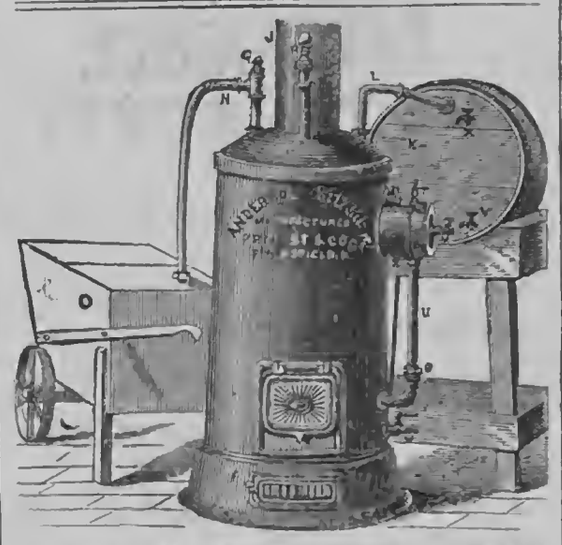
Implements, Machinery, Etc.



ANDERSON'S AGRICULTURAL STEAMER, for *Steaming* FEED FOR STOCK Heating Cheese Vats; Tannery Vats, Conservatories, &c. This Steamer is made of Wrought Iron, thoroughly riveted and finished in good style. It has a reliable Automatic or Self-regulating Water Feeder, Safety Valve, Vacuum Valve, Water Gauge Cocks, Whistle, &c., all complete. The boiler is peculiar in construction, being ONE COMPLETE DOUBLE BOILER WITHIN ANOTHER, the two communicating one with the other. It has an extraordinary amount of fire space for the size of the boiler; No. 3, a medium size, having 3,854 square inches of fire surface; consequently, it requires but little fuel to run it. Either wood or coal may be used for fuel.

It will cook more feed, or heat more water, in a given time, than any other Steamer of the same size or cost. It is more durable than any other, for the reason that the fire-box is made of wrought iron, and is *entirely surrounded with water.* We are also manufacturing:

Anderson's Low Pressure Steam Heater, for Heating *Private Dwellings, Stores, Churches, Conservatories, &c.* We manufacture for all the territory east of Illinois.

For further particulars address
P. P. MAST & CO., Springfield, Ohio.

CARHART'S
PATENT TWO-HORSE
Pulverizing Cultivator

Was Awarded the First Premium at State and County Fairs in 1870 and '71.

It is superior to the best Wheel Cultivator.
The price is only Twenty Dollars.
The draft is reduced nearly one-half.
The depth you wish it to run is regulated without the use of wheels.
It can be drawn close to a tree or plant without injuring it.
It is not disturbed by short undulations of earth, like the Wheel Cultivator, but pulverizes, levels and fits the ground for the Mowing Machine better than any Cultivator in use, and can be used for more purposes than any other implement on the farm.

FARMERS, DAIRYMEN AND BUTTER BUYERS!
PACK YOUR BUTTER
IN
WESTCOTT'S
RETURN BUTTER PAIL

Approved and recommended by the leading authorities of our country on dairying, and acknowledged by all butter dealers to be the very best package in use.

Butter packed in this Pail brings **5 to 10 cents more** a pound in the New York City market than the same quality in any other package.

READ THIS:

NEW YORK, Nov. 15, 1871.

We, the undersigned, Produce Commission Merchants of the City of New York, consider Westcott's Return Butter Pail, manufactured by Silsby Bros., Belmont, N. Y., *the best package in the market.* It is our experience that Butter packed in this Pail *sells more readily and commands a higher price* in this market than in any other package, and we heartily recommends its general use by the dealers, dairymen and butter buyers who ship to this city.

Respectfully,

(Signed by 45 leading Commission Merchants.)

The Westcott Return Butter Pail meets my approval as a good butter package. It is one which I always feel safe in recommending.

X. A. WILLARD,
Dairy Editor Moore's Rural New-Yorker.

Dairymen, send for a Circular! Dealers, send for a Price List! We are the sole manufacturers of **Westcott's Return Butter Pail,** and also manufacture very extensively Butter Firkins, Half-Firkin Tubs, 25-pound Butter Pails, Well Buckets, &c., &c.

Seeds, Plants, Etc.

1872.
DREER'S GARDEN SEEDS.

Always Fresh and Reliable.

A FULL STOCK OF EVERY VARIETY, WITH ALL THE MOST DESIRABLE

NOVELTIES,

IN VEGETABLE AND FLOWER SEEDS, PLANTS, BULBS, &c.

The following are a few of the most desirable:

The Hanson Lettuce.—Heads remarkably large, deliciously sweet, tender and crisp, even to the outer leaves. Price, per packet, 25 cts.

Bastian's Extra Early Beet.—The perfection of a Beet, being very early, of quick growth, fine, turnip-rooted form and good color; a profitable variety for the market gardener, and one of the best for family use. Per lb., $1.50; per oz., 20 cts.

Bastian's Half-Long Blood Beet.—In color, shape and size it is all that can be desired in a Beet; a valuable variety to follow after the preceding one. Per lb., $1.50; per oz., 20 cts.

Dark Red Egyptian Beet.—A small, early, flat, dark, blood variety; highly recommended. Per lb., $3; per oz., 30 cts.

Philadelphia Fine Dutch Cabbage.—A very superior fall and early winter variety; solid heads. Per lb., $3; per oz., 30 cts.

Philadelphia Late Drumhead Cabbage.—The very best winter variety; large, solid heads. Per lb., $3; per oz., 30 cts.

Boston Market Celery.—Dwarf, solid variety. Per oz., 50 cts.

Lesher's Mammoth Asparagus.—The largest variety. Per lb., $1; per oz., 20 cts.

Early White Curled Endive.—Self-blanching, very fine, large, and extra curled and tender. Per oz., 50 cts.

Melon, Casaba.—The largest and finest Musk-melon, weighing from 10 to 15 lbs. Solid, sweet, delicious flavor. Per oz., 50 cts.; per pkt., 20 cts.

Trophy Tomato.—Our own saving from extra large, selected fruit. Per oz., $3; per pkt., 20 cts.

Tomato.—Cook's Favorite, Tilden, Fejee. Per oz., 40 cts.

Tomato.—Philadelphia Market, Gen. Grant. Per oz., 50 cts.

Onion.—Yellow Danvers, Philadelphia growth. Per lb., $3; per oz., 30 cts.

Onion.—White or Silver Skin, Philadelphia growth. Per lb., $3.50; per oz., 30 cts.

Philadelphia Onion Seed produces the finest sets for keeping.

The above can all be had in 10c. packets, except where priced, and are only a few of the many varieties we have for sale. They will be mailed, free, at the prices quoted.

Pea, Dreer's Extra Early.—Has acquired a reputation beyond all others as an even cropper, so essential for an early, profitable crop. Per bush., $10; per quart, 40 cts.

Pea, McLean's Little Gem.—Delicious flavor, dwarf and quite early. Per quart, 60 cts.

Pea, Laxton's Alpha.—The earliest and best dwarf wrinkled marrow pea. Per pint, $1.

Beans, Dwarf German Wax.—Early, remarkably tender and stringless. Per quart, 30 cts.

Beans, Giant Wax.—Large, tender pods; a fine pole variety. Per quart, $1; per pkt., 20 cts.

Corn.—Darling's and Crosby Early Sugar. Per qt., 40 cts. Stowell's Evergreen, the best of all. 25 cts. per quart.

All varieties of Peas, Beans and Corn, when sent by mail, are 16 cts. per quart additional, to prepay postage.

FLOWER SEEDS.

Our stock of Flower Seeds is unusually large and fine. We make a specialty of this department, and grow many of the leading kinds on our own Seed Gardens and Farm. The finest varieties of Asters, Balsams, Carnations, Calceolaria, Cineraria, Cyclamen, Dahlia, Diadem Pink, China Pink, Heart's Ease or Pansy, Larkspurs, Lobelia, Mimulus, Nasturtium, Petunia, Double Portulaca, Phlox Drummondii, Ten Week Stocks, Verbena, Wallflower, Double Zinnia, &c.

Roses, Plants, Shrubs, Bulbs, &c.

Our facilities for the growing, as well as importation, of New Plants, &c., are equal to any other establishment in the country. Upwards of 30,000 square feet of glass are employed in their propagation, and nearly 50 acres are devoted to the growing of the more hardy kinds of Shrubs, Roses, Dahlias, Bulbs and Flower Seeds. All who are in want of Seeds, Plants and Bulbs will consult their own interests by sending for **Dreer's Garden Calendar for 1872**, with full descriptive lists of our stock, prices, &c., will be mailed to all, upon receipt of a postage stamp. Is now offering for sale to actual settlers more than

500,000 ACRES

of the finest and most desirable Farming Lands in the West.

The Lands are chiefly situated along the line of its railroad between the cities of Des Moines and Council Bluffs, and are the most fertile and accessible lands offered for sale at low prices in the State. Prices will range from $5 per acre, the average being about $7 or $8.

Sales are made either for cash, or on short or long time, so as to suit all purchasers. Full warranty deeds given.

EXPLORING TICKETS,

entitling the purchaser of land to a credit of amount paid for fare upon his land, are for sale at the principal ticket offices of the Company.

For pamphlet (with map), or any information regarding the lands, address

I. L. DREW, Land Commissioner,
Davenport, Iowa.

Miscellaneous Advertisements.

"I fully approve of your Colony plans, and wish you a hearty God-speed."

Vice-President SCHUYLER COLFAX.

"Your plans for a Colony in the fertile Red River Valley are excellent in every feature, and the enterprise has my warm approval."

JAY COOKE.

"Your plans will gather a body of men co-operative in all those elements that Christian civilization demands—temperance, moral character, frugality, skill, etc.

Maj.-Gen. O. O. HOWARD.

THE

Red River Colony!

OF MINNESOTA

offers unequaled attractions and advantages to all who desire to move West. Among them are:

1. Its Temperance Features.

No one can become a member who will not pledge his influence against the sale of intoxicating liquors as a beverage within the limits of the colony.

2. Its Character and Privileges.

Good standing at home, intelligence and frugality are essential to membership. School and Church privileges will be afforded to an unusual extent.

3. Its Location,

which is in the far-famed Red River Valley—often called the *Garden Section*—of Minnesota.

4. Its Climate.

This is unsurpassed in its inspiriting, health-giving qualities. No original cases of ague or consumption ever having been known.

5. Its Two Great Railroads.

The Northern Pacific is now running daily trains through this section to Duluth, bringing it as near Eastern markets as Western Illinois. The St. Paul and Pacific, which will cross the section north and south, is under contract to be completed to the British Possessions this season.

NORTHERN PACIFIC GOLD BONDS.

Sales December, January and February over $3,500,000.

BANKING HOUSE OF JAY COOKE & CO.

The policy of the Government looks to a steady redemption of its Bonds at Par.

In view of this fact we would suggest that holders avail themselves of the present favorable opportunity of exchanging their securities for a

BOND OF EQUAL SAFETY.

Many holders are exchanging them for NORTHERN PACIFIC GOLD SEVEN-THIRTIES, at a large profit.

These Bonds furnish to the public an Investment Security which combines the ready Negotiability, the Convenience, and the high Credit of a first-class Railroad Bond, with the Solidity and Safety of a Real Estate Mortgage on Land worth at least twice the amount loaned.

They are offered at Par in currency. HOLDERS ARE EXEMPT FROM UNITED STATES TAX, and both principal and interest are payable in GOLD COIN.

All marketable stocks and bonds received (by express or otherwise) at current prices in exchange for Northern Pacific Seven-Thirties without expense to the investor. Pamphlets and full information furnished on application.

No. 865 Broadway, New York.

FOR SALE.—THE TROUT FARM of the subscriber, at Bristol, Ct. Six acres of land and water, two thousand adult fish, twelve thousand impregnated spawn, hatching house, dwelling house and all necessary apparatus. Terms moderate. Address P. C. CREVELING, Bristol, Ct.

JOHN S. COLLINS, Moorestown, N. J., gives Herstine Raspberry Plants away. Has grown and sold, in the last two years, over 13,000 bushels of Herstine and other berries. Write to him and get some plants.

BOYNTON'S LIGHTNING SAWS

"THE GREATER INCLUDES THE LESS."

Note extra steel and durability as contrasted with old V outline on M tooth. After wearing teeth out they may be recut or sold to some admirer of the old V friction process, used by all other Saws.

NOT ONE FAILED IN 20,000.

Two men cut a 12-inch log, by hand, with this saw, in EIGHT SECONDS, on Sept. 1, 1869, at Philadelphia, in the presence of Maj.-Gen. Meade and numerous other distinguished men.

These are the only Saws in operation that are equivalent to the front Cutting and Clearing of a Hand-Saw BOTH ways—viz., going and coming. The slant edges between the points do not cut, the vertical face of each M cutting, and the slant following, and *vice versa*, as drawn back and forth. All Teeth are Cutters. All Teeth are Clearers. As it costs five hundred or more dollars for the labor that wears out any saw, a saving of one-fifth by speed and ease of an improved saw saves the cost of a dozen. The length, strength, stiffness and durability of these teeth are obvious. Note also speed, ease, simplicity and clearance.

SPEED.—If two points are dressed to cut in line, vertical or advancing cuts are more effective than retreating edges of *old V-cutters used by all other saws.*

EASE.—It is easier to plow a groove in timber than to crush one out.

SIMPLICITY.—All points are the same length, and cut their way. We do not now recommend thick, raking and hook teeth, as they require so much shortening and readjustment.

CLEARANCE.—Cutting by projecting faces, these M teeth clear like a plow, simultaneously.

These Saws are universally conceded to surpass in speed, in ease and in simplicity. If any one questions it, let him accept my $500 challenge (toward expenses of a public contest), and have the matter settled. New enlarged dust-spaced Saws for sale by the Hardware Trade of America. Agents wanted where the Hardware Trade do not sell the genuine Saw. Infringers prosecuted. A 6-ft. Cross-Cut and a Wood Saw shipped on receipt of $6.

N. B.—None genuine without the name on saw of

E. M. BOYNTON,
Sole Proprietor and Manufacturer,
80 Beekman St., New York.

P. S.—Do not confound my Lightning M Cutting Teeth with any infringements or feeble imitations of name or outline having thick, raking teeth; which, unless very carefully shortened, are electric only in their shocks to the operator.

Two men cut twenty-six cords of hard wood in eight hours with the Lightning Cross-Cut Saw, by hand, and will do it again for $500.

Rural Architecture.

PRAIRIE HOMES.

HOW TO BEGIN, ADD TO AND FINISH THEM.

In looking over the several different designs for dwelling houses in the RURAL NEW-YORKER, I do not find anything just suited to meet the wants of a large number of its readers. I mean "the poor man of the West;" and the greatest part of our western immigrants are poor men, indisputably. Leaving the crowded cities, and over-populated districts of the East, to find a home on the beautiful and boundless prairies of the West, the immigrant's first and indispensable want is a house—something to protect his wife and little ones from the sun and rain; not a costly villa, or even a commodious farm house, (which he may have in prospect for the future as the reward of industry and perseverance), but simply a house to live in.

Here the pioneer in the backwoods has a decided advantage. For, with the help of his ever willing neighbors, or, mayhap, only his own sturdy sons, he has but to fell the monarchs of the forest and roll them up, and, with a roof of elm or hemlock bark, until such time as he can manufacture his own shingles, he has a house at once warm

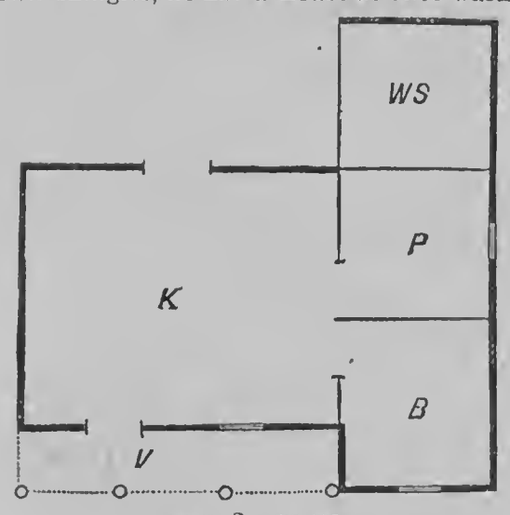

FIG. 2.—PLAN.

and comfortable; besides, it is just as good as his neighbors.

But here, in the sparsely timbered regions of the West, the luxury of a log house is not to be thought of. The first settler is quite too often, for the good health of himself and family, forced to take refuge in a "dug-out," which, for the enlightenment of your Eastern readers, I will describe; for it is a true saying that "one-half the world don't know how the other half live. A "dug-out" is made by simply digging a square excavation in the south slope of a bank or hill, six or seven feet deep in the rear, and building up the front, leveling up the sides with sods plowed from the prairie. Then it is roofed first with polls, then small brush and hay, and lastly ten or twelve inches of dirt, packed down hard. This makes a habitation—I can't call it a house—usually warm, but more or less damp and unhealthy. Yet, as uncomfortable and dirty—for it is dirt in the front, and dirt in the rear, dirt above and beneath—as this might seem to dwellers in fine houses and costly mansions, let me say I have seen whole neighborhoods—and some of these settlers could count their wealth by thousands—living in just such holes in the ground, seemingly happy and contented.

In the accompanying engravings we have, perhaps, given a plan that may seem advisable for some of your prairie readers to follow. There is hardly any one coming here who could not procure lumber sufficient to build a small "shanty," but is deterred from doing so, for, says he, "I will be able in a few years"—remember, the corn-growing and pork-producing farmer of the West accumulates fast when once started—"to build me a good, respectable house, and I hate to waste material upon something that will be nearly useless then." It

FIG. 1.—ELEVATION.

is to help this class of builders that our designs are intended.

Figure 1 represents a simple cottage of only one room, which can be erected at a very trifling expense, even here, where lumber is high and scarce. It is 12 by 14 feet, and 7 feet between joists; it will take material as follows:—800 feet of inch boards, at $30 per thousand, $24; 4 sills, 6 by 6, and 4 beams, 6 by 6, 10 rafters and 12 joists, $6; 2 panel doors, at $2.50 each, and 3 windows, at $1.50 each, $9.50; nails and paper for roofing, $10. Total, $49.50.

Here is a cost of about fifty dollars; and any man of ordinary ingenuity can do all the work himself, with the aid of a carpenter to case the windows and case and hang the doors. Let him first frame the sills and lay them upon the foundation in proper position; next frame the beams, and lay them upon the sills; then securely nail two boards perpendicularly at each corner of the sills. Use sixteen feet boards, cut in the middle; this will make the building seven feet in the clear; now cut four stanchions seven feet long, and with the aid of one person you can raise the beams one end at a time, slip under the stanchions, and nail the top of the boards, that had been previously fastened to the sills, securely to the beams, and you are ready to proceed with the planking, which any one can do who can saw off a board and drive a nail.

For roofing, use saturated tar paper, which is manufactured expressly for it, and for sale in all Western towns. The cost is about one-fourth that of shingles; it is not as good, but will last several years, when you can lay your shingles right over it.

If you build in the spring or early summer, you can omit the clapboards until the fall; but don't omit the veranda. An architectural gentleman in the RURAL once went into ecstacies over blinds. We have nothing

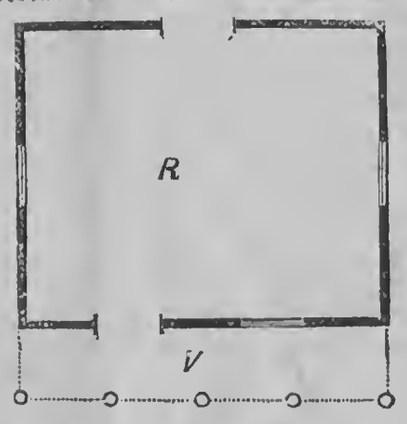

FIG. 1.—PLAN.

rebutting to show; it is a blind subject; but we think the crowning glory of any house, large or small, is a veranda, or, as the girl called it, "our folkses' stoop." So much for Figure 1.

Now we will suppose our humble farmer, at the end of one or two years, has acquired means to enlarge his humble domicile. This he can do, as shown in plan Fig. 2, which consists of his first erection with a lean-to of one bedroom, a pantry, and a wood-shed. This can be erected upon the same principle as the first. The reason we recommend planking and clapboards in preference to studs and clapboarding is, that any one can build with planks; but it will require a professional carpenter to build a studded house. Figure 2 will make a very convenient house for a small family. The inside can be finished with paper or plaster, to suit the taste of the occupant.

Again, we will suppose that "the lapse of years has brought round the time" when our friend wishes to again enlarge his house. If he has followed our former plans, he will do so, as shown in Fig. 3. This consists of an upright part, added to his former erections. He now, of course, has means sufficient at his command, and will call in the aid of a practical architect. He can build this last part two stories high if he wishes; but we would advise a low house in a prairie country. We think this will make a very convenient house, and not devoid of beauty.

Plan, Fig. 1, is a room 12 by 14; V, veranda.

Plan, Fig. 2, K, living room, 12 by 14; B, bed-room, 8 by 9; P, pantry, 8 by 8; W S, wood-shed; V, veranda.

Plan, Fig. 3, L, living-room, 12 by 13; K, kitchen, 12 by 14; D, dining-room, 9½ by 12; B, B, B, bed-rooms, 9 by 8 and 8 by 8; S P, summer pantry, 8 by 8; P, pantry, 8 by 8; W, wood-shed; V, V, veranda. The summer pantry can be used in winter for a place to keep meat, and as a store-room. Being away from the kitchen fire, it will keep fresh meat a long time, in suitable weather.

The cost of the last design, (the third addition,) will not exceed $1,500, and could probably be built for less, if one would do as much of the work as possible himself.

Nebraska, 1872. FRANK D. HOWELL.

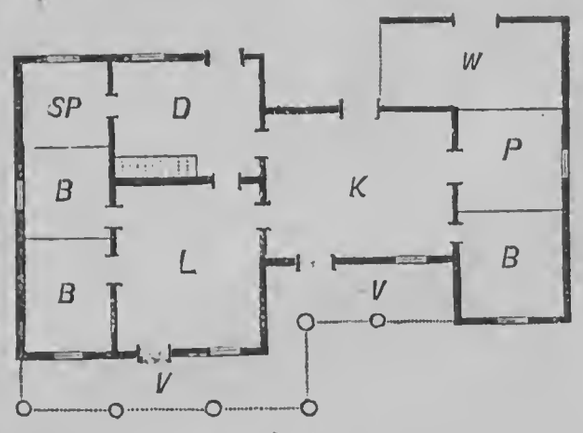

FIG. 3.—PLAN.

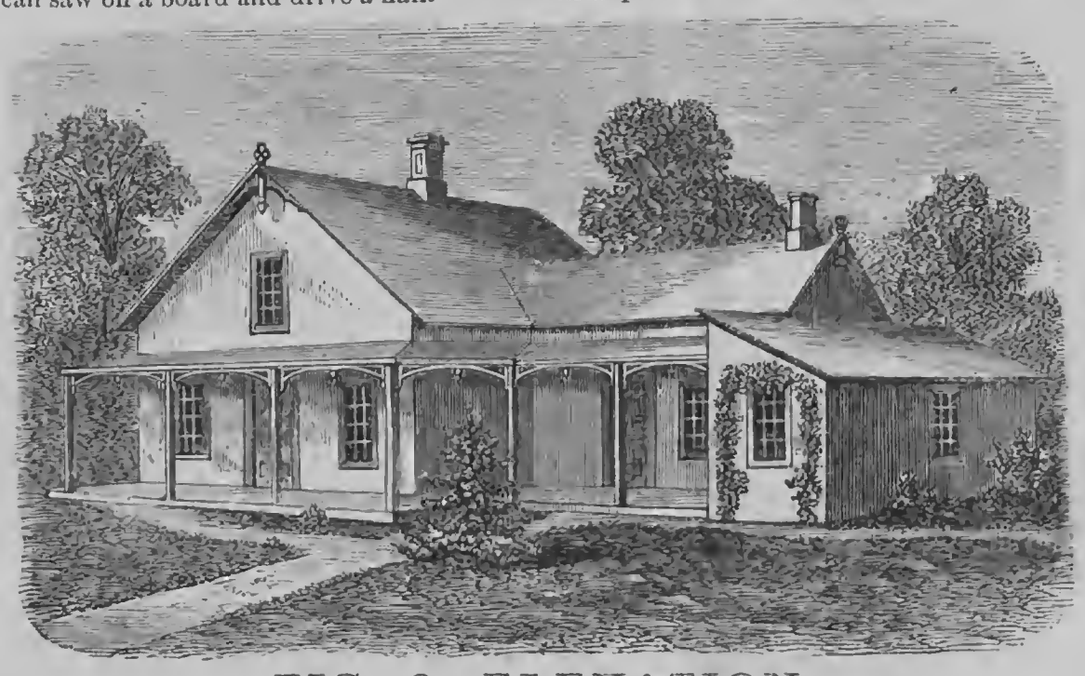

FIG. 3.—ELEVATION.

NOTES FOR BUILDERS.

A House to Cost but $1,000.—I am thinking of building a small dwelling house, to cost about $1,000; and knowing your obliging disposition, I make bold to ask you to give me a plan in the RURAL NEW-YORKER of such a house, with a picture of the exterior. I should like the house to be two stories high and to cost not over $1,000, at the most; I would rather it would be a little less than more.—SUBSCRIBER TO THE RURAL.

OUR correspondent does not tell us the size of his family and how much room he requires in the house. Even with this knowledge we do not think we could do what he asks us. Beside we do not know his locality, nor the cost of material where he is located. He had better employ some architect or builder, at or near home, to do his business.

Chimney Without Draft.—I would like to ask a question for information with regard to a chimney without a draft. Can anything be done to remedy it? The chimney is a very small one; the house is situated on a side hill, sloping to the south; the stove below stairs draws decently well, but the one above smokes so badly that the family cannot do anything with it, while there is wood in it, and coal does not burn so as to bake at all, or cook very much. Does the having a stove below make any difference with the draft above? Will the stove draw better with a pipe running directly back to the chimney, or with a pipe running up four or five feet above the stove?—A SUBSCRIBER, *So. Manchester, Ct.*

A chimney-flue should be small at the base, and increase in size at the top, so as to secure draft. The stove-pipe used should be smaller than the chimney-flue; your pipe may run too far into the chimney; or it or the flue may be filled up; or the chimney may not be high enough. An experienced builder of chimneys, in your neighborhood (if there is such an one), can advise better, after examination, than we can at this distance. Better consult one.

Field Crops.

CORN CULTURE.

SINCE corn is the most important of crops raised in the West, I will give my views relative to it, which I have acquired by observation, reading and practice, more particularly within the last ten years. Prior to that time I had farmed in Michigan, where corn was not so much a main crop as it is here in the Mississippi Valley. The belt of country where corn is raised in greatest perfection is not very extensive; I would not locate it North of forty-two degrees, nor South of thirty-seven degrees, nor East of Indiana, nor West of Iowa. The territory included by these lines may justly be said to be the great natural corn-field of America. Within these lines the farmer may calculate upon his corn crop with general certainty, provided he manages well and cultivates thoroughly. The universal object aimed at by all undoubtedly is to produce the greatest amount with the least expenditure. About all farmers have their notions relative to corn culture—each his hobby which he adheres to with tenacity, notwithstanding some produce uniformly good crops, while others as uniformly produce poor crops—that, too, where the natural condition of soil was apparently equal.

This fact is quite clearly indicated by a comparison of the general average, which will fall short of forty bushels per acre, even in this favored region, while I have known of some instances where seventy bushels per acre were raised for a series of years in succession. The cause of this gain of thirty bushels per acre by some and the loss of it by others, is a matter of too much importance to be overlooked. Like causes will produce like effects, even in the treatment of a corn crop. And here I will give a few general rules, which I have known to give the best results for different seasons and under different circumstances, although it is not expected that these rules can be followed every season by all; yet he who can follow them closest will be best pleased with results:

Select a deep, rich, warm soil; plow deep in autumn or early spring; drag thoroughly in spring, as early as season and condition of soil will permit; then plow well with corn plows; drag again; then lay off into perfect rows, four feet each way; plant with a two-horse planter, three grains to the hill; roll immediately with a heavy roller. As soon thereafter as the corn begins to show above ground, drag well; within a week or so drag again; then put in your teams and corn plows, and keep them going until the corn gets so large that it drives you out of the field. C.

CORN FODDER.

THERE was more corn sown for fodder during the past year, in this section, than ever before. The latter part of the season being cold and wet, was unfavorable for the crop, and many failures occurred. Having met with varied success and failure during the past five years, I find certain requirements necessary to obtain a good crop of corn fodder. The first requisite is manure, and if it is not already in the soil, it must be placed there. Corn is a gross feeder, and raw manure applied to the roots will not hurt it. Never sow broadcast, unless upon a rich soil, without first giving a heavy surface coating of manure. Upon a poor soil, we have always obtained a heavy crop, by the following process:

We furrow out the ground, as for planting potatoes, making the furrows three feet apart. We fill these furrows about half full of stable manure, then scatter the corn, by hand, upon the manure (at the rate of two and a-half bushels per acre), following with a one-horse, three-toothed cultivator, which mixes the manure with the soil, and covers the seed. The ground is left loose; the manure is right where the roots can find it, giving the young plants a good, strong start. Cultivate between the drills as soon as the corn is up, and the crop will soon shade the ground and take care of itself. As to variety, we prefer the large-growing sweet corn, such as Stowell's Evergreen.

Cutting and Curing.—Finding that cutting sowed corn with a common corn cutter was slow work, we tried a brand-new grain cradle, and soon smashed it up. The corn was so heavy that, if the cradle had been stout enough, it would have been hard work. Taking an old cradle, we cut off the scythe and fingers to about one-half their former length, and found it to be just the thing. With this, the crop is easily laid in swaths. We bind it up in bundles as soon as wilted, and let it cure in the shock. It comes out as bright, green-colored, and sweet-scented as when first cut. The bundles must be well set up in shocks that will shed the rain, and left in the field until perfectly cured. It takes a long time for the large, juicy stalks to dry; but sown early and cut in bloom, it will have ample time to cure. Cut in September, it may be put in the barn at your leisure, after the other farm crops have been secured, any time in November.

It is only fun to run the stalks through a Gale's Copper-strip Cutting Machine, and all kinds of stock relish it and thrive upon it. Horses and colts are very fond of it. The limit to the amount one can raise is the amount of manure that can be devoted to it.—A. G. TILLINGHAST.

FIELD NOTES AND QUERIES.

Making Corn without Hoeing.—After twenty years experience in the culture of corn, I am prepared to say that the hoe can be set aside as soon as replanting and thinning is over. In order to do this, the land must be well broken and pulverized before the corn is planted. The distance between rows should be from five to six and a-half feet, and from two to three and a-half feet in the drill, according to productiveness of land. The corn should be dropped, after going twice in the same furrow, with an eight-inch shovel. When the corn is covered, it should be four inches below the surface. The first plowing, put just enough dirt to the corn to fill the furrow half full; second plowing, the furrow can be filled. This leaves the corn level, and the ground is not too high for you to dirt the corn with plow the third or last time. Be careful not to break or disturb the corn roots the last two plowings. Corn planted and cultivated in this way will stand a drouth much better, and the blades will not turn yellow, as they always will do when the roots are broken.—W. H. C.

Yellow Pryor and Missouri Broad Leaf Tobacco.—The editor of the Rural World answers a correspondent, who asks in reference to these varieties of tobacco, as follows:—The Yellow Pryor is the lightest and brightest, and generally brings the highest price of the two. Those lots that have brought the high prices named were generally grown on thin, fine conditioned land, receiving special care in growing, curing, handling, &c. The Yellow Pryor is very generally cultivated, and in Franklin Co., Mo.—one of the most successful tobacco districts—is the favorite. What is lost in weight, is made up in quality. The Cuba or Havana is cultivated by some; is very fine but light; produces a small crop, brings the very highest prices, but the seed deteriorates very soon. The price per pound would be in favor of the Cuba, but the return per acre in favor of the Pryor.

Wild Clover.—Please find inclosed a specimen of clover found growing wild here. Please give the name; also, tell me if it has any value, or has ever been cultivated.—A SUBSCRIBER, *Palestine, Crawford Co., Ill.*

WE think it is *Trifolium stolonifcrum*, or buffalo clover, which is a native of Illinois. But you should send leaves as well as the dry heads to aid us in determining the species. We do not think that this, or either of the two other wild species of the West and South, have ever been cultivated.

Sorghum for Soiling.—I wish to inquire the value of sorghum as fodder for soiling. What time to sow, quantity per acre, and how to sow seed, if in drill. I have rye for early feed, then clover, and then I would like to sow sorghum, if better than corn. I am keeping from thirty to forty milch cows, and run the milk to the city. I find I can keep my supply more even by soiling, and can double the stock that I can keep on pasture.—J. F. C.

"How Much will Wheat Lose in Grinding?"—So asks P. A. SPIKE, and adds:—"I am inclined to think some of us farmers who take grists to mill, get badly sold thereby." We have heard good millers say that wheat loses from two to three pounds per bushel by grinding; but the wheat of some farmers, as they take it to mill, will lose five pounds or more by properly screening it before it is fit to grind.

A Deadly Grass.—One remarkable fact connected with Queensland botany is, that a grass, which grows locally abundant in the more Northern portions of the colony, *Aristida hygrometrica*, is fatal to sheep, by reason of its long sharp tripartite awns getting entangled in the wool and ultimately piercing the skin and penetrating to the viscera of the thorax and abdomen.

The Swine-Herd.

WHAT CONSTITUTES A THOROUGH-BRED HOG?

IN reply to F. D. CURTIS, relative to what constitutes a thorough-bred hog, may I not ask him if the fact that the first and second cross between a Chester White and a Poland China produced in the first place *nine white* pigs, and in the second *five* white pigs and *three* spotted ones, *all* having the form and characteristics of the Chester White, don't prove pretty conclusively that the Chester White is a thorough-bred, "capable of transmitting its form, characteristics and all of its peculiarities to its offspring without change?" If such a fact don't establish the point claimed, *i. e.*, that the Chester White is a thorough-bred, will my good friend CURTIS tell me what constitutes a thorough-bred hog?

His reference to PASCHAL MORRIS as authority relative to the Chester White hog with upright ears, proves but little, when we take into consideration the fact that THOMAS WOOD, G. B. HICKMAN, JAMES YOUNG and N. P. BOYER of Chester Co., Pa., H. P. COURT of Michigan, and L. W STUART of Iowa, the latter taking the second premium at the Chicago Swine Exhibition, and all other well-known breeders of pure Chester White hogs, *all* breed Chester Whites with ears pointed down, and none with ears erect.

The taking of MORRIS as authority on Chester Whites, is about on a par with taking HARRIS as authority relative to the Poland China hog. Take "Harris on the Pig," and read his description of the "Magic Hog," and then read what he says in his "Walks and Talks on the Farm," about what he saw at the Chicago Swine Exhibition, and one will conclude that his "On the Pig" is not of much "authority," so far as the Poland China pig is concerned. So far as the Chester White is concerned, it is enough for me to know, that not a single breeder, of any note, breeds at this time Chester White hogs with upright ears, MORRIS to the contrary notwithstanding.

LYSANDER W. BABBITT.

Council Bluffs, Iowa.

THUMPS IN HOGS.

I NOTICED in the RURAL NEW-YORKER of Feb. 17th, an Ohioan's plans to cure thumps in hogs. He is partly correct in saying it is lung disease, but it is caused by wind getting in the cavity of the stomach outside of the entrails, which wind compresses the lungs so that they cannot expand enough for the animal to breathe easily—hence the "thumps." For when they inhale the air to inflate the lungs, that compresses the air in the cavity of the stomach, and as it cannot be compressed enough to allow a full inflation of the lungs, the re-action of the wind in the cavity compresses the lungs before they are half inflated, and forces out the air inhaled, with a thump. If not remedied, the wind accumulates in the cavity till it is so full the lungs cannot expand by inhalation, and death is inevitable.

So, having given the cause and action of the thumps, I will now give you a remedy that has never failed with me or my neighbors (which is more easily applied than the Ohioan's), which is simply to catch the hog affected with the thumps, and take the little blade of a pocket knife and pierce a hole through the sides of the hog to the hollow between the last two ribs. Be sure you stick the knife clear through, and not far enough to touch the intestines. As soon as the opening is made you will discover the wind coming out freely, the lungs are relieved of the pressure behind them, and the hog is cured. I have tried this often, and have never failed at any stage of the disease. JAMES H. WENTWORTH.

Shady Grove, Fla.

PIG-PEN PAPERS.

Quinsy in Swine.—A veterinarian writes the Iowa Homestead that the quinsy is caused by exposure to sudden changes of atmosphere, and that if the animal has been under the debilitating influence of bad food, impure water or filthy inclosures, mortification frequently sets in, and death results in a few hours. He recommends the following treatment:

"When the disease begins with general feverishness and hurried breathing, give from one to four drops of aconitum, in a tablespoonful of water, every two hours. When, in addition to the above symptoms, the throat is swelled, give belladonna in the same quantity, and alternately with the aconitum, every two hours. If the tongue becomes red and swollen, give in place of the aconite what will stand on the half of a pea of mercurius iod. Should the throat turn purple and mortification threatens to set in, or great weakness supervene, give from one to four drops of arsenicum, in place of mercurius. The mercurius iods should be of the first centesimal trituration, and the other medicines should be of the first decimal dilution. They may be obtained of any homeopathic physician."

Jersey Red Hog.—Can any of your New Jersey correspondents give the public any information, through your columns, concerning the origin, history and character of the family of hogs known as Jersey Reds? If so, they will oblige many breeders of swine by doing so at an early date.—FRANK D. CURTIS, *Charlton, N. Y.*

Industrial Topics.

NOTES FROM THE WEST.

Sheep and Wool.—The few wool growers who kept up their flocks "on principle," through the last four discouraging years, are now jolly over the situation. Such persistent flock-masters as THOS. GORBY of Portage, CALVIN CASWELL of Erie, and WM. F. GREER of Lake—all of Ohio, have their dish right side up for this shower of porridge.

I have a letter from a large wool grower in Illinois, who kept up his fine flock in Ohio, until patience ceased to be a virtue, and then took them West, which says:—"I have just returned from a ride on horseback through Vermillion Co., Ind., Vermillion, Edgar, Douglass and Piatt counties, Ill., in search of stock sheep, and have to report that there are, at most, literally no sheep of any kind to be found in all those counties, which, four years ago, were among the largest wool producing counties in the State. All along my route of travel, I could hear of where there had been flocks of from five hundred to several thousand, but three or four years ago, but all are invariably known to have been fed for mutton and shipped to market. I learn from one of the principal buyers of Bloomington, that there was not more than one-fifth the amount of wool purchased in that market, from McLean county, the past year, that there was three years ago."

For the past four years, up to last season, the dairymen of the west have had the better of the wool growers. Last year was hard on the dairymen, and now many of them are desirous of going out of the dairy business and into wool-growing. To do this will require a sacrifice at both ends of the change, since they cannot well dispose of their cows, and sheep are few and dear, and the change would be like that hazardous one of swapping horses in the middle of a stream.

The Pork Business, for the past season, has been as bad, or worse, than the dairy business, with a net average of less than $5.50 per hundred weight, whereas, in preceding years, the average has been $9 to $10 per hundred. The quality of the pork packed this season has been very good. In Cincinnati, from Nov. 1 to March 1, there were packed an aggregate of 146,000,000 lbs. The average net weight of hogs was 231 lbs.; average of leaf-lard per hog, over 29½ lbs. Cincinnati is the *Ham*-burg of Ohio.

Saw-Logs.—The winter has been quite favorable for getting out timber, and the result is the largest crop of saw-logs I ever saw in this region have been congregated at all the mills in the country. The mills which run by steam may go through these immense quantities of logs, but the water mills will be stalled, unless there is more than the usual flow of water to work them off. In the burnt districts of the pine woods of Michigan, &c., the lumber business has been very active, in order to save as much as possible of the dead timber before it becomes worm-eaten. The consequence of all these things will be a plenty of all sorts of sawed lumber in these regions.

Coal in Indiana.—I recently made a tour through the State of Indiana, and was much interested in the late discoveries of excellent quantities of bituminous coals in Parke, Clay, and other counties of that State. The black coal of Parke county is of a superior quality for the manufacture of iron and steel, which is a great desideratum in the industrial economy of Indiana. There are also abundance of coals for fuel and for the manufacture of gas. These discoveries are giving new life to the solid manufactures of the Hoosier State. S. D. H.

Farm Economy.

SOILING STOCK.

I AM, Mr. Editor, one of those who believe that our farms are not cultivated enough. There is my neighbor A. yonder, who has 50 of his 125 acres in pasture. If I ask him what he will take for his farm he will be likely to tell me $75 or $100 per acre. If I wanted to buy that portion of his farm in pasture he would ask me about $50 per acre for it; and yet there is at least half of it that does not pay him annually seven per cent interest on $25 per acre. It is good land enough, but it grows little or nothing in the shape of forage for his cows and sheep. Why, sir, I can select ten acres of it, which, if fenced off from a piece of bottom land he has in the same field, would not keep ten sheep alive through the summer. And yet that land will pay 20 per cent. interest on $100 per acre, in its location, if properly managed.

Yes sir, soiling cattle will do it. Let that land be plowed, manured, sowed in clover, and the clover cut and fed direct to the stock, and it will keep five times the amount of stock that it does now, and keep the animals better—yield the farmer more profit from each animal. "Labor is the bother," said my friend JONES the other day. So it is; but it is not a bother that is insurmountable, if a man has the good sense to know how to treat and pay his laborers. Where lands are high and valuable soiling has got to be adopted—every inch of land must be cultivated. My friend could profitably sell half of his land at $50 per acre, till the other half as it should be, keep more stock on it, and derive more profit therefrom than he does now from the whole. And the half of the farm would, in five years, be worth more money, absolutely, than the whole is now.

Do you say this is dogmatic assertion, unwarranted by facts? I say no. I have seen it tried. The agricultural papers have furnished facts proving it; there are men in New England and New York getting rich at farming, who never made a dollar at the business until they began to cultivate every inch of ground they own, and to carry a heavy stock of cattle, sheep and swine upon it by soiling, to make manure with which to enrich their land. Their farms have grown better and their bank deposits larger ever since. I wish I could induce some of them to give facts and figures (to which I have not access now) through your columns, to prove what I have here asserted. I hope they will do so. FARMER GARRULOUS.

MANAGEMENT OF MANURE.

WILL you please give through the RURAL NEW-YORKER your views as to the treatment and application of sheep, cattle and horse manure. To make my question plain let me give my own practice:—The greater part of the droppings from sheep and cattle accumulate under the shelters occupied by each; the sheds are frequently littered with straw. The horse manure is dropped into one side of the cow shed, and becomes partially mingled with the cow manure. My method has been to leave these accumulations in the sheds until after harvest, then apply as top dressing to winter wheat, or spread on sod designed for corn. Would it be a better plan to haul out in spring, and pile as for composting, if one cannot add muck or other material? Will it pay to haul simply good black dirt—not extra rich—one hundred rods to increase the heap? Where manure only partially rotted is applied in autumn—not to be plowed in or otherwise mixed with the soil till spring—should it be spread immediately, or left in small heaps?—W. M. T.

IT is better to handle such manure, even to simply pitch it into a wagon and haul it out and pile it; for each handling benefits it. If allowed to remain under the sheds it will pay to fork it over thoroughly once a month during the season. If there are no other absorbents available it will pay to mix soil with such manure—a clayey loam is best, but any soil, except pure sand, is better than none. We should spread even partially rotted manure as we haul it on the land. We know of no gain in piling it up in the field, except in the shape of a compost heap, with plenty of absorbents to take up the gases as it decomposes.

ECONOMICAL NOTES.

Application of Manure.—I always read with especial interest the result of experiments, in the RURAL NEW-YORKER. Some years ago a much esteemed neighbor of mine, who was in the habit of buying considerable manure for his farm, made the remark that his buildings, which were all neatly painted white, were painted with manure. But the question is, when, and how shall we apply it, in order to receive the most benefit from it? I used to think that when I applied it to meadow, in the fall or winter, it was sure to yield a rich return. But two years ago this winter, I gave a newly seeded meadow a top-dressing of twenty loads per acre, and do not think that I have received two dollars per acre benefit from it. There was scarcely any rain the spring following, and both summers have been very dry. My experience seems to indicate that the surest way to obtain the largest returns from manure (fine or rotten), is to apply it to land after it is plowed, then drag, sow to grain and grass seed. I never fail to have good grain, and a good seeding, when applied that way. If there is any way to get a larger return from it, in ordinary farming, I would like to hear of it, through the columns of the RURAL.—F. D. P., *Rome, New York.*

Ground Bones and Ashes for Peas, on sandy land, will be found a most excellent application. If Mr. THOMASON, who asks, will add a good dressing of muck, and plow it in, he will raise a good crop of peas, other conditions being equal. By the way, we would be glad to know how successful pea growers manage this crop, and what they regard the best variety for a field crop.

The Sportsman.

NOTES FOR SPORTSMEN.

Fishing Through Ice.—The following is the Western Indian's mode of fishing through ice:—Whittle a stick about six inches long, into a shape as near that of a fish as possible; color it with ink to look like a fish; strip the feathers from the side of a quill, and attach them to the sides and back, for fins. By running the point of a knife along where the fins are wanted, the feathers may be put in the opening. Make a rabbet groove in the bottom, and run in some lead; hitch a thread to this and your decoy is complete. Cut a hole through the ice and put two bent poles over the hole, with their ends in a notch in the ice; throw over the hole a blanket to make it dark; get your head under the blanket, with your spear, ready to throw in the decoy. Jerk the string of the decoy a little, and it will swim around not unlike a real fish. (The thread should be tied to the decoy a little one side of the back.) Now if you do not have the fever too bad, and are quick and sure enough, you may get a fish. I have had rare sport in this way, and some good fish to eat.—J. S., *Corry, Pa.*

To Catch Pickerel Through the Ice.—In looking over the RURAL NEW-YORKER I saw that P. C. S., Otsego Co., N. Y., wished to know how to catch Pickerel through the ice. This is my way:—Pickerel may be easily caught, in places where the water is not too deep, by cutting holes in the ice and using the common hook and line. From four to eight feet is about the right depth of water. By using what are called "tip-ups," one person can attend to several lines, each of course being placed in a different hole. Take a strip of board two inches wide and two feet long, and bore a hole near one end; through the hole, put a stick long enough to reach across the hole in the ice; thereon fasten your line to the short end of the strip, and drop the hooks in the water. When a fish bites, the long end of the stick will tip up and can easily be seen. For bait use small fish or almost any kind of meat.—S. T. N., *Cambridge, N. Y.*

Inquiries for Sportsmen.—J. R. asks how to make and set a partridge trap. J. H. L. asks the best mode of tanning musk-rat and dog skins, etc. J. J. HARDWAY, Columbus, Ga., wants to get a fine setter pup. We know of no one to whom to direct him, who has one. "Uncle NED" wants to know how to raise black bass, and where the fish or spawn can be procured. DOWNING asks the best kind of a dog to purchase for hunting deer and prairie chickens. He will want two—a hound and a setter. GEO. SKINNER asks the best way to tame and keep wild pigeons. "Young Sportsman" wants to know what kind of dog is best for hunting wolves in Kansas.

The English Fox Hound, (see illustration), RICHARDSON says, "appears to have been produced from the stag hound by a cross of gray hound and probably also of a terrier. He is less in size than a stag hound, has smaller and less hound-like ears, is bold, dashing, sportive, supersedes, because of his general usefulness, all other hounds; is bred to size, &c., according to the sport for which he may be acquired. Several connoisseurs of dogs commend our spirited engraving of these hounds."

The Herdsman.

SOMETHING NEW CONCERNING ABORTIVE COWS.

THE great prevalence of "abortion among cows," in the dairy districts of New York, during the last ten years, and the difficulty of arriving at any correct conclusion concerning the cause of the trouble, must give interest to any new facts or theories in respect to this scourge of the dairy. At the recent meeting of the American Dairymens' Association at Utica, we had a conversation with Dr. BRIGGS of North Pitcher, N. Y., who claims to have discovered some curious features connected with the disease, not hitherto noticed. In all instances when he has made dissections of aborting cows, animalcules have been found in the lungs, in the vagina, and in other parts of the animal, while the expelled foetus has also been affected with the same class of organisms. In dissecting the immature calves he affirms that worms are invariably found about the umbilical cord, and he attributes the disease to these causes.

It will be remembered that a few years ago the State of New York appropriated a considerable sum of money to be expended in investigating the cause of abortive cows, and Commissioners were appointed for the purpose. We believe no dissections of affected animals were made by those selected to investigate this matter, or, at least no microscopical examinations were resorted to. The commission, extending over two or three years, collected a large number of facts, from which certain deductions were made, but nothing positive was elicited as to the cause of the trouble. We thought at the time, and still think, that the great fault of these investigations consisted in not making a thorough examination of the aborting cows, and in not having an experienced microscopist detailed especially for this purpose. It had been long suspected by members of the Little Falls Farmers' Club, that abortion was due to causes similar to those named by Dr. BRIGGS, and it was hoped that by the aid of the microscope the matter would be fully settled.

The statements of Dr. BRIGGS seem to be confirmed by those of M. BONLEY, well known for his researches concerning the diseases of cattle, such as carbuncle, &c. We [illegible] it stated that this gentleman has lately made a communication to the Academy of Sciences at Paris, based upon some investigations of M. ZUNDEL upon epidemic, or what he calls enzootic miscarriage in cattle, as follows:

He states that it has long been known that when a cow undergoes a miscarriage in a stable occupied by other cows in a condition of gestation, this accident does not remain isolated, but on the contrary, and, in fact, very commonly, the remaining animals miscarry successively, as though a contagious principle had been discharged from the first case, and communicated to all the others. It has already been shown by experiment, that if the liquids discharged by a cow that has just miscarried, be introduced into the vagina of another cow nearly at full term, the miscarriage will take place in the second case.

According to FRANCK, this is produced by the *micrococci* or *bacterias*, which exist in an extraordinary quantity upon the fœtal envelopes, and conduce to their decomposition. These being introduced into the vagina, multiply with great rapidity, penetrate to the uterus, and there initiate that decomposition of which abortion is the consequence. If it shall be established that abortion among cows is caused by living organisms of the character referred to, we have reason to believe that a remedy will yet be discovered for this disease, which is proving to be one of the greatest scourges that has ever afflicted the herds of Central New York.

There is no abatement of the trouble this year in Herkimer and the adjoining counties. We know of herds in which thirty or more cows had aborted during the early winter and up to February 15th. In some dairies the loss from this disease for a series of years has been more than the entire profits from the herd during the time. The question of "cause and remedy" for the trouble is one of very great interest to the dairy public, and we give the above facts in the hope that further examinations may be made, either confirming or refuting the statements to which we alluded.

X. A. WILLARD.

NOTES FOR HERDSMEN.

Mange on Cattle.—In a recent RURAL NEW-YORKER, an Oregon subscriber says his cattle are afflicted with a "scaly and rough skin around the eyes," looking like "salt-rheum," and asks what it is, and what to do. It is mange—a disease of the skin, caused by parasites, which burrow under the surface, and, if not checked, will extend over the body, and injure, if not kill, the animal.

I have cured, readily, several cases, by rubbing off the scurf on the sore places, and washing the parts with carbolic acid, dissolved. A solution of blue vitriol would probably answer; one or two applications will effect a cure. After applying the carbolic acid, or vitriol, rub on sulphur, mixed with lard, every other day. The parasites must be killed; this the caustics will do, and the ointment heals the sore. Do not apply mercurial ointments or tobacco, although the latter is not so dangerous as the former.—F. D. CURTIS.

Hoof-Ail.—JOHN ADAMS of Redfield, N. Y., vouches for a cure of "Hoof-Ail" in cattle, by the use of "Anderson's Dermador." He is not interested in this remedy, or any person making or selling same; but for its quick disposal of the disease, he says it is wonderful, and is reliable. He has cured several of the very worst cases by only a few applications of the remedy. We think Mr. ANDERSON himself does not know of this effect of his "Dermador;" and it will do many much good for you to make a notice of this, if you choose to do so.—J. M. ADAMS.

Cure for Bloat in Cattle.—I have found tobacco—a decoction of the weed is best, as it operates soonest—to be one of the best cures for bloat in cattle that I ever used. I never knew it to fail to give relief within fifteen minutes after administered.—I. W. SANBORN, *Lyndonville, Vt.*

Swelling on Steer's Jaw.—(See page 130, RURAL NEW-YORKER Feb. 24.) Take one ounce indigo, mixed in one pint soft soap; rub on the swelling. I had a steer a year ago with a bunch as large as a large apple; this cured him in a few weeks.—E. R. B., *Moscow, Mich.*

Lice on Cattle.—I have driven lice from cattle by the use of kerosene oil, which should be poured along the spine, on the head, and rubbed on the udder. Wood ashes, sifted around the stalls, are a good preventive, and will drive lice from the stable.—P. BELMAN.

The Naturalist.

NOTES FOR NATURALISTS.

Sheepshead.—Will not some of the naturalists who read the RURAL NEW-YORKER tell me if the fish known in the small streams of New York State as "sheepshead" is identical with the *Sargus ovis* of the sea—along the Northern coast of America? This sea fish is reported to attain, sometimes, the weight of fourteen and fifteen pounds. No "sheepshead" of the small streams and creeks of New York, that I ever caught, ever weighed over one pound.—FISHERMAN.

WE suppose the fresh water fish our correspondent alludes to is the one commonly known as the "sunfish"—*Promotis vulgaris*—an entirely different fish, of which we have caught hundreds, but never one, we think, that would weigh more than half a pound. It is a dark greenish-brown on the back, greenish-yellow on the sides, the lower end of the gill tipped with red, and the belly orange and gold. It is, we believe, a member of the perch family.

Horned Screamer.—A friend of mine asked me the other day if I could tell her what a "Horned Screamer" is. She said she heard the term applied by one person to another, and could not understand the pertinence of the application, nor could she discover the origin of the word. I also have failed, and ask you.—PATIENCE P. R.

HORNED SCREAMER is the common name of a bird (*Palamedea Cornuta*) which inhabits the swamps of Brazil. It is of a blackish-brown color, nearly as large as a turkey. From the head, a little back of the bill, rises a long, slender, movable horn. The front of the wings has spurs which are said to be used by it for defensive purposes. The horn spoken of, and its loud, harsh cry give it its name. How the term could be properly applied to a person we cannot conceive.

Taxidermy.—Will some of the readers of the RURAL NEW-YORKER give me the *modus operandi* of taxidermy (without the use of arsenic, or any other poisonous substance if possible), as I wish to make a collection, and doubt not that others would do the same if it can be done without incurring the risk of being poisoned.—T. J. FENTON.

Arboricultural.

APPLE AND CHERRY SEEDLINGS.

WILL you please inform me, through the columns of the RURAL NEW-YORKER, how to raise apple and cherry seedlings. I find that I can obtain more reliable information through your paper than elsewhere.—B. CAYWOOD, *Herndon, Va.*

THE most common method of raising apple seedlings is to procure fresh pomace from the cider mills and wash out the seed. If the pomace is not fresh, having remained several days in a large heap, and begun to ferment, the seed will be of little value. The seed may be spread out and dried, if it is desirable to transport them to any other locality; but the longer time they remain dry the less likely they are to germinate. The best plan is either to sow them immediately, or mix with moist sand and set away in some cool place until spring, and then sow in broad drills, covering about an inch deep with fine, rich soil. We would never incur the expense of sowing apple-seeds purchased at seed-stores, or elsewhere, until they were tested. It costs too much to prepare a seed-bed, for one to waste time and labor in sowing poor seed. A small portion, or all the seed obtained from an unknown source, may readily be tested by mixing with sand and placing in a warm place for a few days, or a week; when they begin to sprout, then sow them. If they will not germinate in such a position, of course it is not worth while to sow them in the seed-bed. By testing the seed before sowing, one can determine what portion is likely to grow, and they may be scattered in the drills accordingly. It is not advisable to sow the seeds too thickly, for if each seedling is allowed sufficient room for growth, it will be as large at the end of the first season as it would be at the second, if crowded.

The best stocks for standard cherry trees are Mazzard seedlings. This species of cherry, although a native of Europe, has become exceedingly common in woods and hedgerows in most of the older States. The cherries should be gathered as soon as fully ripe, and placed in vessels where the pulp will become soft; then wash out the seed and sow immediately; or mix with sand, and bury in the open ground until the following spring. Cherry-stones should never be allowed to become dry, as their vitality is destroyed much sooner than apple or pear seed.

ARBORICULTURAL NOTES.

How the South Americans Make Fruit Trees.—DARWIN, in his "Naturalist's Voyage" (1871), says:—"In Chiloe, the inhabitants possess a marvellously short method of making an orchard. At the lower part of almost every branch, small, conical, brown, wrinkled points project: these are always ready to change into roots, as may sometimes be seen, where any mud has been accidentally splashed against a tree. A branch as thick as a man's thigh is chosen in the early spring, and is cut off just beneath a group of these points; all the smaller branches are lopped off, and it is then placed about two feet deep in the ground. During the ensuing summer the stump throws out long shoots, and sometimes even bears fruit. I was shown one which had produced as many as twenty-three apples, but this was thought very unusual. In the third season the stump is changed (as I have myself seen) into a well-wooded tree, loaded with fruit."

Grafting the Ash upon the Oak.—ALFRED GRUGEON writes the London Garden that last summer he found a fine young Ash which had been grafted on an Oak. He says:—"This had been done about two feet from the ground, and the line of separation was sharp and distinct between the two barks, although the character of the ash bark was slightly changed, seeming more rigid and unyielding than the ordinary condition; while both bark and wood had acquired the astringency of the oak, and when put in water, tinted it blue; and while the common oak trees were full of fruit, this was entirely destitute. Whether it ever blossoms, I cannot say, as I have not yet visited it at the proper season. The habit of the tree also seems modified, and, I think, improved, being more compact; the wood is much harder, though it does not seem to differ in structure. The tree may be fifty years old—probably more."

Coniferous and Evergreen Seed.—What length of time does coniferous and evergreen seed preserve its vegetating properties? Is there very great risk in getting good seed?—SAML. BONEHAM.

THE seeds of most evergreens will retain their vitality several years, if stored in a proper place—one that is not too moist or too warm. As a rule, however, it is not best to trust seed that are more than two years old; if recently gathered, so much the better. There are some species of Pine, the cones of which remain closed until subjected to heat or moisture; the seeds being hermetically sealed, therefore, will retain their germinating powers for a dozen or more years in this position. We have taken seed out of cones of Cedar of Lebanon, that had been in our cabinet for ten years, and they germinated as freely as though freshly gathered. We do not think you would run much risk in purchasing evergreen seeds from any of our well known seedsmen.

Chestnuts in Northwestern Mo.—In the RURAL NEW YORKER, Jan. 20th, you wished to know of the possibility of growing the Chestnut tree in Kansas. My observation of Chestnut growing only applies to this county, which is only separated from Kansas by the Missouri River. There are several enterprising farmers here who have fine specimens of the Chestnut growing on their farms. It is found that the soil and climate are suitable for their growth, which is very rapid, exceeding that of many of our native forest trees. I think that the Chestnut can be grown here upon the prairie lands to a great advantage and profit. These remarks will apply equally as well to Northeastern Kansas and Southeastern Nebraska, as to Northwestern Missouri, as the soil and climate is about the same.—M. J. W. M.

Treatment of Grafts.—Please give me a little advice in regard to the care of pear grafts. Last year I set some, and now I want to know whether they shall be pruned or allowed to remain as they are. Shall I allow them to bear as soon as they will naturally, or should the first fruit be removed.—A. J. L., *Pawtucket, R. I.*

IF the grafts have made a vigorous growth—say two or more feet in length—shorten them at least one-half. This will make them throw out strong lateral shoots and prevent breaking out by the wind. The grafts should not be allowed to bear fruit until they are at least two or three years old. If permitted to produce much fruit before they are well established, or firmly united to the parent stock, there is danger of not only checking growth, but breaking off the junction with the stock.

Osage Orange in Vermont.—Will you please inform me if the Osage Orange will, or will not, thrive in the lower part of Vermont?—INQUIRER, *Pownal, Vt.*

No. The Osage Orange is too tender for any locality in Vermont.

Hygienic Information.

HYGIENIC NOTES AND QUERIES.

Frosted Feet.—In RURAL NEW-YORKER, Feb. 3d, KATIE S. wants to know what is good for frosted feet. I am not learned as to science; but an accidental application of grafting wax to my horribly itching feet, about ten years ago, charmed not only the parts frosted, but in addition my whole nervous system in five minutes. I never think of the circumstance but gladness and joy follows. I was root-grafting late in the evening, and in my rage stripped my feet, applied the wax to the affected part; the air was at once excluded and quiet restored. On going to bed I repeated the coating, slipped on an old sock; repeated the same next evening, and passed two winters without any return of the trouble. I have never known it to fail since, when well applied. Two years ago, Capt. PATTON of our town was confined to his room, feet covered with cloths or moccasins. I gave him a ball of the wax, told him what it had done for me and others. Suffice that he asked me yesterday how it was made, as his feet had not troubled him since the first application till this week. He said his feet felt so good he refused to take off his waxey socks until they were worn out, and no amount of money would compare with the comfort and ease he took. I use three parts resin, two of beeswax, and one of tallow, melted and well stirred together, poured in cold water, and worked into a ball by hand.—W. W. TIPTON, *Coffey Co., Kan.*

Ringworms and Frosted Feet.—In the RURAL NEW-YORKER of Feb. 3, a cure is wanted for frosted feet; also for ringworms. Here it is:—Take of carbolic acid, (liquid,) one part, oil of any kind, two parts; apply evening and morning a few times; shake it up when you use it. It is good for burns, will keep out erysipelas, proud flesh and gangrene from old sores, and to relieve neuralgia pains in the face, it is extra. Perhaps a little more of the acid should be added for neuralgia, so as to make it a little pungent; but the clear acid will blister. Try it; try it. In two instances I have known ringworms cured that covered much of the neck and one side of the face.—DAVID LANDON, *Jackson Co., Mich.*

Remedy for Hoarseness Wanted.—My little boy, EDDY, now past six years old, has been afflicted with hoarseness ever since he was about three months old, it having commenced with a severe cold. Medical aid, thus far, has failed to relieve him. Will any of the numerous readers of the RURAL NEW-YORKER, for the benefit of this, and perhaps many other cases, give, through its instructive columns, a safe and efficacious remedy for the above-named complaint?—A. J., *Waltham, Mass.*

Wintergreen as a Cancer Remedy.—I heard, by way of an old gentleman who used to practice the Thompsonian system, that Wintergreen is a powerful remedy for cancers. I do not know how it was used, but, from my knowledge of him, and his skill in curing the sick, I should be inclined to give some attention to CHARLES YARDLEY'S "Wild Tea," if it is learned that by this he means the common "Wintergreen."—L. M. B., *Ionia, Mich.*

The Poultry-Yard.

ST. LOUIS, MO., POULTRY SHOW.

THE St. Louis Poultry Society held its first Fair in the capacious hall of the Library Buildings in St. Louis, on the 26th of February last. For a first effort, it was a remarkable success, as an exhibition and financially. Its whole management would throw into the shade the boasted ability of a society within the boundaries of our State. The coops were all alike, and of uniform size; wide passageways were left between, for the visitors to pass and repass with comfort. One thing which particularly attracted my attention was the easy, quiet and methodical way things were managed. No shouting, no bustling, no hurrying to and fro, no pitching up and throwing down coops, no fowls being hid from view by a lot of imported, sickly birds being placed alongside of them. Each officer and aid seemed to have his duties assigned him, and to fully understand and attend to them. The officers, from the President down, were continually on hand, ready to answer and settle all doubts and difficulties. The fowls received the most constant and careful attention, and their comfort was looked after in every respect. The floors of the coops were very nicely covered with gravel, and kept scrupulously clean. Soft feed was provided for their morning's meal, grain and vegetables in the evening, and occasionally meat and ale, when the fowls showed fatigue.

I always knew the West had fine fowls, but was not prepared to meet so many good birds across the Mississippi. A Western gentleman remarked to me that "our Eastern breeders must not expect we shall put up with any other than first-class birds. Vulture-hocked Cochins and Brahmas do not pass muster here. There is a certain fancier in your neighborhood who sells out too often for our taste and credulity; and what perplexes us more is how he can have a few more fowls' eggs to spare from the same stock."

The principal exhibitors and winners were B. N. PIERCE, CHAS. DREW, E. W. PATTISON, I. C. HATCH, C. L. GILPIN, D. L. WILBUR, N. H. TODD, I. C. LONG, A. B. NEILL & Co. I cannot close without thanking my St. Louis friends for their generous and hospitable reception.

ISAAC VAN WINKLE.

Greenville, N. J.

THE ENGLISH FOX-HOUND.—(Page 195.)

POULTRY NOTES AND QUERIES.

Houdan Fowls.—"A Farmer's Wife" in Indiana writes us that she does not agree with those who regard Houdans "subject to disease, poor winter layers, hard to raise, &c." She has had them for three years, given them a good, fair trial, and "would not discard them now. Ours sit occasionally; and as layers, they hold their own against any fowls with which I am acquainted, not excepting the Poland; and, on an average, they will weigh as much as the Brahmas, and are so much better for the table."

Crossing Brahmas with Leghorns.—Your correspondent, R. E. N., speaking of crossing the Brahmas with Leghorns, speaks of the Leghorn cock and Brahma pullet. I should like to ask R. E. N. if the Brahma cock and Leghorn pullet would not cross as well? As I have a fine lot of Leghorn pullets, I should like to try the experiment.—S. A. D., *Newark, N. J.*

What Ails the Hen?—We have a hen that is in the habit of backing up, especially when she is picking up food. She will crouch down and back up several feet. I would like to ask what is the cause of it, and if there is any remedy? Otherwise than that the hen appears healthy.—W. H. B., *Ithaca, N. Y.*

Inquiries for Poultry Advertisers.—An Iowa correspondent asks where he can get Japanese Bantam fowls.

Diary of a Ruralist.

DAILY RURAL LIFE.

FROM THE DIARY OF A GENTLEMAN NEAR NEW YORK CITY.

Uncovering Plants.—*March* 4.—The severe cold of the past few days being rather unusual at this season, should be a warning to those who are always in haste to remove the winter protection from plants. Of course it is not advisable to allow the covering of strawberries and other plants to remain until growth has proceeded to any considerable extent, still it should not be removed too early, because we often have a cold snap even after spring weather has actually come. Plants that have been protected during winter are more sensitive to cold than those unprotected, and it is far better to allow them to remain in their winter dress until the buds are swelled considerably, than to take it off, and then have growth checked by cold. After the long, dreary winter, we are inclined to be in haste for summer; but the old adage of "Haste is not always speed," should be remembered.

Windbreaks and Trees for Railroads.—*March* 5.—Since the great snow blockade occurred on the Union Pacific Railroad, there appears to have been an increased interest awakened in regard to planting trees near the railroad lines that cross the great prairies. High board fences will never answer as obstructions to snow; in fact, they usually cause high drifts, and do more harm than good. What is wanted is something that will partially check the wind and break its full force. A wide belt of compact growing evergreen trees and shrubs is the one thing required, and the sooner our railroad directors learn this the better.

One of the officers of a Western railroad said to me a few days since that his company proposed to import small seedling trees from France to plant along their line on the prairies. This, to me, appears to be a foolish idea, inasmuch as we have an abundance of native trees equal in every respect to those found in any other part of the globe; besides, ours being natives of the climate, would certainly be more likely to succeed. There are barely two species of foreign forest trees that will succeed in the North, for which we have any practical use, and these are the Norway Spruce and European Larch. But there is no necessity of importing these, for our nurserymen are abundantly able to supply all the seedlings required. But really, what does all this talk of belts, screens, windbreaks and timber for railroad ties amount to on the part of these great corporations? They have been telling us for years what they are going to do, but they have as yet done nothing that would be considered creditable to a fourth-rate gardener, much less a gigantic enterprise, as they are wont to style their vast operations. There is no need of their waiting to import seedlings; and if they cannot purchase nursery grown trees in this country at a satisfactory rate, there are millions of seedlings of the most valuable species of trees known, which can be had for the cost of pulling up or digging. There are seedling Arborvitæs enough in Northern Wisconsin and Michigan to make a continuous broad belt of trees the entire length of the two great lines of railroads across the continent. No cheaper or better screen could be made; and if other timber is required, our forests and nurseries will supply the plants cheaper than it is possible to obtain them elsewhere.

The first railroad company that takes hold of this subject in earnest will enhance the value of their stock ten times the cost of the trees planted.

Enthusiastic Collectors.—*March* 8.—Whenever I meet a friend who is about starting on a journey to some distant portion of the country, I invariably ask him to collect specimens in some branch of natural history. Occasionally I obtain some good things in return for the suggestion, but there are exceptional instances to the general rule. I do not know why it is so, but I am sensibly aware of the fact that one-half of the people travel for no particular purpose, except for the sake of going somewhere. I think that it was VON HUMBOLDT who said of one of our noted American travelers, that he could "go further and see less than any other man." As a case in point, I will state that an intimate friend of mine visited the Rocky Mountains last summer for the purpose of seeing whatever was to be seen in that very interesting region. Before he left I requested him to bring me, among other things, any species of beetle that might come in his way. A bottle of alcohol was put into his trunk for this purpose, and he bade me good-by, with the remark that he would astonish me with the numerous things collected during his travels. He has returned safe and sound, and I am truly astonished at his vast collection, for it consists of one solitary grasshopper, floating in a pint bottle of alcohol! The case of my friend is neither peculiar or uncommon; for I have known scores of men who have traveled extensively, and visited the nations of both hemispheres, without contributing as much as one lone grasshopper to science. We should be thankful that all men are not so negligent or unobserving; for, were it so, we should have no DARWINS, HUXLEYS, or AGASSIS, because it is not possible for any one man to gather in person all the materials necessary to write a great work on any branch of natural science. In our great natural bee hive there are more drones than workers, and most of those who do work think more of bread than pure honey, while they might, if properly informed, collect both at the same time, without extra labor.

FIG. 1.—KNITTING-NEEDLE CASE, OPEN.—(SEE PAGE 198.)

The Gardener.

GARDENERS' NOTES.

Save Your Own Tomato Seed.—A word about the Trophy Tomato. Is it a new variety? If so, where has it been hid away this many years? I never raised it, but one of my neighbors showed me what he had bought for Trophy, and his crop was far inferior to mine. For a dozen years back we have always had a new kind advertised, every one of them just the thing—perfection at last. By what I have seen of the Trophy, it is another of the same. I have no seed to sell; but I grow tomatoes that I would like to see the Trophy beat. Understand me, it may not have been Trophy I have seen, but it was sold for such. I grow tomato plants and fruit for market; six years ago I commenced to save my own seed. When the fruit begins to ripen, I go through the field, and when I find a plant strong, healthy, with large, smooth fruit, I drive down a stake, tell the pickers to gather no fruit of these plants. I have followed this for the past six years, and I will venture to say they cannot be beat; at least, I have not seen them beat yet. Certainly, if a person grows a few in a garden, with extra attention, they may produce a few extra fine fruit; but I am speaking of field culture. So I say, let your readers save their own seed—not the first ripe tomato, but the plant that bears the finest fruit. By so doing I can raise plants that I can sell readily for 50c. per dozen, where I used to have trouble selling them for 25c. I have raised the best kind from the plants raised from the Tilden. If the Trophy is what it is said to be, it must have been raised by this method. In a few years, by my method of saving seed, your readers will be surprised at the few seeds they will get from a large tomato.—JAS. MCI., *Newcastle, Pa.*

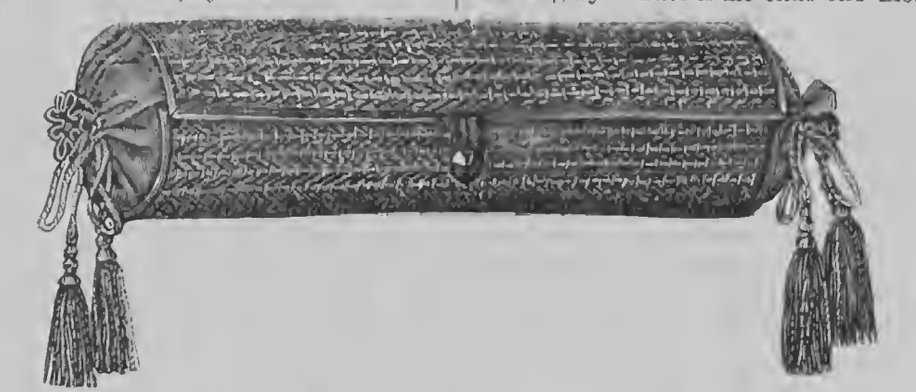

FIG. 2.—KNITTING-NEEDLE CASE, CLOSED.

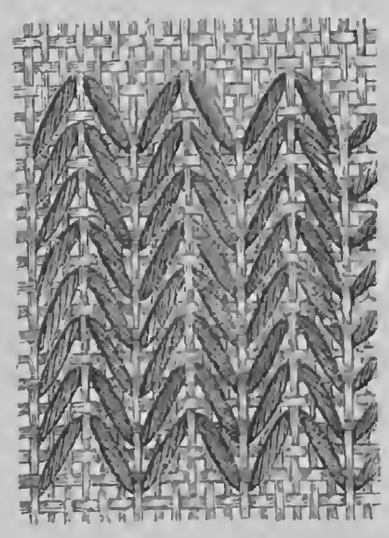

FIG. 3.—KNITTING-NEEDLE CASE—DESIGN.

Raspberry Trellises.—For garden culture of the raspberry, a trellis is better than stakes. The rows should be at least five feet apart. Along these set good strong posts, every fifteen or twenty feet. Upon these posts stretch two strands No. 10 iron wire—one eighteen inches from the ground, and the other three feet. If the wire is painted or coated with tar it will prevent rusting. Of course iron posts and galvanized wire would be still better, but not as economical.

Preparing Land for Strawberries.—A correspondent requests us to tell him how to prepare land for strawberry plants. We have read volumes on this subject, and prepared a good many acres with our own hands, therefore feel qualified to give the required information in a very few words. Make the soil deep, rich, and pulverize it thoroughly. This is all that the most successful grower in the country ever attempted or accomplished. When the soil is put into such a state a man may plant strawberries with a pretty good expectation of obtaining a strong, vigorous growth, provided he obtains sorts adapted to his locality. Whether he ever gets any fruit will depend somewhat upon the variety planted and the method of culture adopted. But the ground work and foundation of success is in putting the land into the condition we have described.

The Vineyard.

SPRING FROSTS IN VINEYARDS.

THE *Messager Agricole*, a French periodical devoted to scientific agricultural and horticultural pursuits, publishes a paper on this subject, written by M. Gaston Bazille, president de la Societe Centrale d'Agricul-

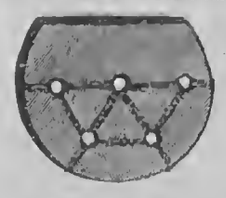

FIG. 4.—DETAIL OF KNITTING-CASE.

ture de l'Herault. "It is," says the author of the memoir, "just before sunrise, when the sky is serene and the atmosphere calm, that danger to the vines is imminent, even when the thermometer is some degrees above the freezing point; but if the heavens are cloudy, or ever so slight a mist obscures the sun, there is no danger to be apprehended. After many trials of various means of producing a dense smoke economically and quickly, and maintaining it from an hour before sunrise until an hour or two after, I have found nothing answer nearly so well as the burning of refuse of coal tar distillation, which costs a mere trifle. This, when set fire to in shallow earthenware pans, gives out a dense black smoke, effectually obscuring the brightest sky. These pans should be placed at intervals of about twenty yards on the east and north sides of the vineyard only; for it is to be observed that it is useless to place them on the south or west, inasmuch as when the wind is from these points of the compass the vines never suffer. The critical period appears to be about the middle of April. If," says the memoir, "the sun has set in a clear sky with a north wind, the chances are that there will be frost in the morning, and it is then that my workmen are up earlier than usual. The thermometer is consulted frequently, and whenever it is found not to be seven degrees above freezing, a number of them, each carrying a lighted torch, pass quickly along the line in which the inflammable material has already been placed in suitable vessels, applying his torch to each as he passes rapidly along, and in a few minutes the whole vineyard is protected by a curtain of black smoke. In the year 1864 this process was repeated on three consecutive days, viz., the 9th, 10th, and 11th of April, at my vineyard of St. Sauveur, and on the first day caused no little alarm to a village situated about five miles south of our operations, and when the cause of the smoke became known created considerable amusement, and gave rise to many jokes by my neighbours at my expense; but, as my vines were preserved, while theirs suffered considerably during these three days, they are now, when spring frosts are expected, to be seen in their vineyards torch in hand. The system is not expensive; five or six men will suffice to protect a vineyard of thirty hectares (75 acres), at an outlay of about fifty francs for materials and labor."

GRAFTING THE GRAPE.

THE past twenty years I have grafted and propagated many thousands of grape vines in my green-house and in the field; have tried almost every month in the year, and I find April or May the best time, or when the buds are just bursting or pushing; then no sap will trouble or drown out the graft, as is the case when the grafting is done in the fall or early spring, as heretofore recommended. Such grafting will most surely prove a failure. I use no wax; clay is much better; but the cions must be kept back. Graft below ground, on young, thrifty plants. No good grafter would ever think of grafting old snags or old trees that ought to be cut down; and so with old vines that have been neglected and not renewed; they are no better than old snags, and it is time lost to try to improve such self-exhausted and worn-out plants. Nor can grafting be done by every one without some practical experience. No grafter is always successful in grafting the apple or pear, much less in grafting the grape, as it is quite a different process, although quite simple to one who knows how.—D. M. P., *Dansville, N. Y.*

VINEYARD NOTES.

What to do with Grape Vines.—I have twenty-eight grape vines, set two years ago last spring. They stood in rows about eight feet apart each way—four vines in a row, from north to south. I cut them back pretty closely the first and second spring after planting, and set a short stake to each vine; but they have made such vigorous growth that the vines are principally on the ground—some of them ten feet in length. The vines are Concord, Hartford and Ives.—J. D. W., *Paxton, Ill.*

Erect trellises upon which you can train the vines, giving to each four feet of space in which to grow and bear fruit. Train them out in the form of a fan, leaving a dozen heavy canes to each, of about a foot in length.

Cutting and Bottling Grapes when Ripe.—An English gardener announces his purpose to cut his cold grapery grapes hereafter, when ripe (in October or later), leaving about eight inches of stem attached to each bunch; carry them to a dry room, where are a number of bottles filled with clear spring water, in which is a little charcoal, and in this water insert the stems attached to the bunches. By this means he expects to keep Muscats until March. He proposes to keep them upon a shelf in a dry room.

Keeping Grapes.—F. R. ELLIOTT writes the Ohio Farmer:—"When I put my baskets (half bushel) of two layers only, making the baskets about half full, cut directly into the basket and set away in a cool room—not a warm loft or a damp cellar, I find I have the best results. I have to-day before me as I write (20th of February), Catawba, Winslow and Agawam, all sweet and perfect, but the Winslows having once been frosted are not as plump as they should be, although the bunch is full and the berry sweet."

Dairy Husbandry.

CANADIAN DAIRYMEN IN CONVENTION.

THE Annual Meeting of the Canadian Dairymen's Association, at Ingersoll, Ont., in February, was largely attended, and much enthusiasm prevailed during the entire session, which occupied two days. This Association was organized July 31, 1867, and has been of very great service in promoting an improved system of dairy husbandry in the Dominion.

The first cheese factory erected in Canada, we think, was during the year 1865, HARVEY FARRINGTON of Herkimer, N. Y., having organized the associated system in Oxford Co., when he built the parent factory of the Dominion. The system has been popular in Canada, and the spread of factories has been rapid. In 1870 there were seventy factories which reported operations to the Association, and the officers state that the list was incomplete. We presume the number of factories now in Canada will not fall short of one hundred, and we estimate the quantity of cheese made annually in the Dominion, in factories and farm dairies, to be at least 15,000 000 of pounds. During our attendance at the recent Convention we had expected to get accurate statistics in regard to the quantity of cheese annually made in the Dominion, but were able only to obtain estimates. The Census reports, we understand, are now in course of publication, which will doubtless give valuable information concerning the dairy interest in Canada.

At the opening of the Convention Mr. JAMES NOXON, the President, gave a short address, congratulating members upon the marked success which had attended the organization from its inauguration to the present time. He referred to the work of the Association in instituting a Cheese Fair last autumn, which had called out a large show of cheese, and which must serve to stimulate improved manufacture. Single premiums as high as $100 had been paid by the Association for the best cheese exhibited at the Fair. He referred to the advantages to be derived from incorporating the Society, and thus obtaining aid from the government to carry forward the work which had been inaugurated. Subsequently Mr. BALLANTYNE, and others, spoke in favor of incorporation, and a resolution was passed, asking the Executive Committee to take steps to obtain this object.

Mr. JAMES HARRIS gave a very excellent and practical address upon the subject of tainted milk, which was followed by some sensible and pertinent remarks from Mr. H. FARRINGTON, on cooling and aeration of milk before delivery at the factory.

Mr. RAYMER of Markham described briefly the effects of exposing milk to the sun. In his experience, when the sun was allowed to shine upon milk in his vats, it had a bad effect upon it. He advised that milk be kept out of the sun, not only on its way to the factory, but after it had arrived and was being manufactured into cheese. Mr. CRAIG of Norwich, and Mr. CASWELL of Ingersoll, cheese dealers, gave some very valuable information in regard to the English market. Mr. CASWELL, during the past season, had handled nearly three millions of pounds, and most of it had been sent abroad. Mr. S. A. FARRINGTON of N. Y. made a very sensible address upon Butter Making in connection with Cheese Dairying, and advocated this system to some extent.

Mr. L. B. ARNOLD of N. Y. addressed the Convention upon the subject of Poison Cheese, using his extensive diagrams, showing microscopic views of diseased milk and milk affected by fungi.

The Annual Address was delivered by X. A. WILLARD, of the RURAL NEW-YORKER. We have no space in the present article to give a synopsis of the addresses or discussions, but shall refer to some new facts elicited, in a subsequent article.

The officers elected for the year 1872, are as follows: *Pres.*—THOMAS BALLANTYNE, Stratford. *Sec.*—J. H. BELL, Ingersoll. *Treas.*—C. E. CHADWICK, Ingersoll, and 20 Vice-Presidents.

There was great harmony and good feeling prevailing throughout the various sessions of the Convention, and the interest in the proceedings was kept up to the last. A vote of thanks was given to the retiring President and Secretary, and Ingersoll was selected for the next Annual Convention, when an adjournment was taken and the crowd separated, pronouncing this to have been one of the most valuable meetings ever held in Canada.

SALT FOR CHEESE.

I HAVE been in the dairy business for twenty years, quite extensively; have always endeavored to make the very best article that could be made, and have intended to use any material to gain that point, without regard to cost. One very essential thing is salt, of which I speak now. I have concluded there is but one kind of salt that can be used and make the quality of butter and cheese of which I speak, and that is the Ashton salt.

I first used the common barrel salt for several years; I then used the Ashton for several years; and after they commenced manufacturing the Onondaga salt I was induced to use that, which I regret. I must say I made poorer cheese while I was using that salt than ever before. I used it most of three seasons. My cheese, after a certain age, would get off flavor. I became satisfied, and came back to Ashton again, and my cheese was all right, flavor perfect, and age does not seem to affect it. I have examined several dairies and some factories, and find their cheese with the same fault, and all of them use the Onondaga fine salt.

I claim it is the use of this very salt that has caused the buyer and consumer so much over caution on the flavor of cheese; they claim they must have a cheese so mild that there is no flavor at all, merely tasteless. It has hurt the sale and consumption of cheese extensively. How many factories there were this last season that sold their June and July cheese from six to eight cents a pound for the trifling difference on salt, the farmer paying full price for making, and yet not receiving over two-thirds price for his cheese. I have conversed with a great many on this subject, and the most of them are against me. Mr. G. B. WEEKS of Syracuse, still advocates the Onondaga salt.

Mr. WEEKS says he has used the Onondaga salt ten years, with good results; he has been making cheese in Herkimer county, where he has sold his cheese at from sixty to ninety days of age, and has had no chance to know the result of age on cheese salted with Onondaga salt. I have had as nice cheese as I ever saw, at sixty and ninety days, salted with that salt, and then they would soften, and, with good attention and cool weather, could be managed; but the flavor would be bad, and grew worse with age. I have wintered cheese nearly every winter, and all I have salted with Ashton salt came out in the spring all right; those that I salted with Onondaga salt would have a bitter flavor, and grow worse with age.

I advise all patrons of factories to look to the kind of salt used in their cheese, and have no other than Ashton used. Try it for yourselves, and perhaps you may know as well as myself. I hope others will speak, through your paper, upon this subject.

E. G. JONES.

Onondaga Co., N. Y.

Pomological.

POMOLOGICAL GOSSIP.

The Lieb Cherry.—A correspondent of the Gardener's Monthly says:—"This cherry was brought from Germany twenty years ago, and was planted on one of the highest points in Galena, Ill., where this tree has withstood extremely cold winters without injury, and has never failed to produce an abundant crop of fruit, (except when the blossoms were destroyed by the late spring frosts.) The fruit is very large, of a crimson color, nearly sweet, while the flavor is not surpassed by that of any other cherry. It ripens within a few days of the Early Richmond, and the fruit has never failed to bring twenty-five cents per quart in the Galena market. It has been named and recommended by the Jo Davies County Horticultural Society, also by ROBSON, SOULARD, KITTOE and others."

The Best Pear to Eat.—Please ask your horticultural readers:—Which of all varieties of pears grown in this country is the best, the most enjoyable, when you set down with your best friend to eat it?—A LOVER OF GOOD THINGS.

WE publish the above for the purpose of getting a vote from such of our readers as eat pears, and thus illustrate the fact that there is no standard of taste.

"Vermont Greening" Apple.—In Oxford Co., Me., Hon VIRGIL D. PARIS says there is an apple extensively grown under this name, which is a late fall and early winter apple; some call it "Fall Greening." Will not some of the Maine Pomologists tell us what it really is?

Domestic Economy.

RAG CARPETS.

I HAVE read inquiries for the manner of making, or striping, a rag carpet; have not seen them answered, so will give your readers a little of my past experience in the business. I say "past," for my husband, though very indulgent, declares that if I ever make another piece of carpet he will apply for a divorce; but there is, as yet, no injunction on my having the rags cut and put in a safe place from the moths, nor upon my imparting what knowledge I have gained, by years of experience, to new beginners, though if such as wish to know how could but take a seat by our fireside, we might have a chat that would be much more explicit and beneficial, for one might write a chapter, or a volume, on the subject, and yet each one would have to learn something from experience and their own good judgment as to how to arrange the great variety of fabrics which are used in a rag carpet.

If we could but select such materials only as would take the most desirable colors, it would be very easy to arrange them to suit our fancy. But this is not the object of carpet making. There are in every house, closets, boxes, bags and bundles to clear up; old clothes, which are too much worn for any other purpose, that would hang in the garret as food for moths. We often hear good housekeepers exclaim, "Oh! I should not know how to keep house if I did not make carpet to clear it out!" We can find nothing for carpeting which will wear as well in a farmer's home, where dirt is brought in from the farm so often, as well-made rag carpet; for after a good dusting it is just as good as new. It is not made so much for the beauty as durability, yet wants colors that will not fade, and so arranged in weaving as to give as good effect as possible.

If one is making a long piece the colors which you have the most of may be used in the carpet for a large room, leaving the rest to be arranged for smaller rooms; or if only for one room, then you must divide it up so as to have the colors go through the whole piece. We find it the best way, where we have good, honest weavers, to furnish them one and a-half pounds of rags to the yard, cut, sewed and reeled in skeins; and, for about twenty-five cents a yard, they will do all the rest, and send good carpet, yard wide. I will give the stripe of one:—There are two fancy stripes, with a wide stripe of black and brown between black, one and a-half inches; dark brown same width; then one and a-half inches of black again; one thread of white, two of blue, three shades of green, the darkest next the blue, which forms a stripe two inches wide; one thread of yellow; two of yellow and black doubled and twisted together open-banded (the weavers will understand the terms); one thread of scarlet, which is the center of this stripe; next comes the yellow and black, twisted open-banded, which turns the "wale," as the weavers say; then the thread of yellow, &c., back to the wide black and brown and black again. Next come two threads of dark purple, then three shades of red, which was dark analine, all wool, reddish calico, and pale analine, on woolen rags; then two threads of twisted brown and white; three of brown and two of white, alternate; this is the center of this stripe; then brown and white twisted the other way, and then the red and purple; then the wide black and brown.

The warp is dark color, which is made by putting all the old dyes together after the rags are colored; five knots are used to the yard—not very coarse warp.

Another, which will take in all shades of rags, is made in this way:—The main stripe is one and a-half inches black; the same width in gray; the same of black-green; three threads madder red; three threads pink, colored in madder dye; three threads of blue, three dark green woolens; three pale green; one yellow; two blue and white, twisted together, open-banded; three of black and two of white, a thread of each alternate, which forms the center of the stripe; then comes the blue and white, twisted open-banded; then the yellow, green, etc., back to the black stripe. This forms one fancy stripe. The other is, one thread of yellow, one of black, till you have three of each, alternate, for each side of the stripe; then a stripe four inches wide, which we call a *chene* stripe, is made of odds and ends, which will not work well in any other stripe—such as old calico, cambric linings, some dark blue, bits of plaid, striped goods cut across the stripes, occasionally a piece of any two colors twisted together—anything and everything put together, in pieces from five inches to as many yards. This is a good stripe; the colors being old, tried colors, will last as long as the carpet will wear.

Now, in regard to coloring: We often have recipes in the RURAL NEW-YORKER, as well as other valuable papers, for colors which take readily, look very showy at first, but soon fade. I would advise carpet makers to use fast colors—such as will not fade in the light, wash out or wear off. A little bright red, or scarlet, will always remain, and give old carpet a cheerful look. Some even buy cheap red flannel, when their other colors are not very good. Madder and alum will give a durable pink on cotton; the same for red on woolen goods; or a brighter scarlet is made when solution of tin is used with madder. Analine and logwood will last some time on wool; but for cotton goods it is sure to fade. Annotto makes a bright orange, but will fade in the light. It is a poor color. Beech bark, with alum, makes a drab; hemlock or oak, a brown; or, a better way is to take cotton rags to the tanners, and they will give you a dark brown, much cheaper than we can do it. We often see recipes for coloring blue, yellow and green, on cotton, which are durable. The dye for blue may be all put in a copper kettle, and the rags colored in less than an hour, when, if you follow some directions, color copperas first, then turn this to blue, it takes three hours, and you are not as sure of a good blue. Then, after coloring your yellow, the two dyes may be used for green, adding a little more dyestuffs, as required, and you can make all shades of green at a trifling cost.

Preparing Rags for Cutting.—Old clothes should be ripped, washed, and pinned on a line to dry, where the wind will free them from dust, when they can be cut and turned back and forth, to save sewing; the strong edges where the seams come will hold together, even though the cloth is much worn, and makes better carpet than when cut off and sewed together; avoid sewing as much as possible, and the warp will wear much longer; wind in balls that which is not to be colored; reel the rest in skeins of one or two knots each. Now, there is one thing more I would like to say to those who make a carpet occasionally; cut and sew a garment when it is worn out, and not leave them all to be cut just when wanted. We can't afford to make carpet if it is to wear on our health much. It is no mark of good economy to sit and cut rags day after day and week after week, as many a woman who has tried it knows.

One woman boasts when showing a new carpet:—"Why, I cut and prepared every bit of that long piece myself in four weeks." Yes, and has since paid to the doctors as much as the whole is worth, and will carry a lame side and stomach and lungs, which rattle like corn husks, as many years, if she lives as long. In some cases, it is right to exert ourselves, almost to the utmost; for instance, where there is a large family to support and educate, with but slender means; or in case of sickness of its members, our task is long and arduous. But here, we have a sustaining power to rely upon, whose strength is sufficient for all things, but in the other case, we have only our own—well, the boys say *vim*, though I don't find it in WEBSTER, and it will not pay.—A. R. R.

ODDS AND ENDS.

Knitting Needle-Case.—(See Figs. 1, 2, 3 and 4, page 197.) This case is made of reed canvas, worked with colored wools, and lined with scarlet cashmere. Take a piece of reed canvas 9 inches long and 8 inches wide, and work on it the design seen in illustration Fig. 3, with red and gray wool in 6 shades, observing that the thick threads of the canvas should run across. Line the work with muslin and scarlet cashmere, and bind it round with narrow scarlet ribbon, putting in at the same time the ends of double cashmere, 7 inches long and 2 inches wide, with a running finished with a cord and tassels. Then sew on to the lining a number of fittings of cardboard covered with cashmere, and each furnished with holes to receive the knitting needles according to illustration Fig. 4. Sew on a loop and button to close the case as seen in illustration Fig. 2, where the ends are drawn up and the cords tied into a bow.

Rice Pudding.—Boil one teacup of rice in a little water, until soft; then add one quart of milk, one teacup of sugar, two or three eggs, one tablespoonful of butter, one cup of raisins and a teaspoonful of salt. Bake and serve with cream and sugar, or wine sauce. I wish some of your readers would give a good recipe for cocoanut pudding.—B. M. H., *Painted Post, N. Y.*

The Literary World.

NEW PUBLICATIONS.

Father Taylor, the Sailor Preacher.—By Rev. GILBERT HAVEN and Hon. THOS. RUSSELL. Boston: B. B. Russell.

THE life of this remarkable man, as told by his biographers, is more interesting than a romance. Father TAYLOR is known throughout the land as an earnest preacher, who, for more than half a century, labored among the seamen of Boston. He was an original wit, a preacher of great power, and the volume devoted to the story of his life will be read by thousands with intense interest. The work is piquant and toothsome, made up of contributions from a large number of people who knew Mr. TAYLOR.

Mines, Mills and Furnaces of the Pacific States and Territories. By ROSSITER W. RAYMOND, Ph. D. New York: J. B. Ford & Co.

THOSE who know the works of this professional writer, are aware of their value. This large book contains a full and exhaustive account of the gold and silver mining of the United States, descending even to minute details. This work contains a fine account of the stamp mill, and a general discussion of smelting processes for silver ores. The book is technically accurate, and popularly interesting. It makes a large, clearly printed 8vo. volume of 458 pages, and sells for $3.50.

Public and Parlor Readings: Prose and Poetry for the use of reading clubs, and for public and social entertainment. Edited by LEWIS B. MONROE. Boston: Lee & Shepard.

THIS work has the merit of being modern, since it contains selections from the latest writings of the authors of to-day. The book is large and handsome, contains 350 pages, and has much which will please all readers. Many copyright selections have been used in these pages. Among the authors are Hugo, T. B. Aldrich, Charles Reade, Ingelow, Longfellow, Beecher, Gough, Whittier, Gunnard, Cary, Street, Scott, Whitman, O. W. Holmes, Heald, etc.

Wild Men and Wild Beasts; Or, Scenes in Camp and Jungle. By Lt. Col. GORDON CUMMING. New York: Chas. Scribner & Co.

A BOOK of wonderful interest to all young folks, full of romantic accounts of hunting expeditions in India. We have seen many of the horns, skulls and hides of the animals killed by Mr. CUMMING, and we have good reason to believe that all he writes is truthful. The book is profusely illustrated and handsomely printed. It cannot fail to interest old and young.

Small-pox; The Predisposing Conditions and their Prevention.—By Dr. CARL BOTH. Boston: Alexander Moore.

THE author of this little pamphlet has a theory in relation to the part common table salt plays in the human system, and on this he founds his belief in relation to small-pox. He thinks a proper use of salt will put the system in a good condition to resist the disease. And he has a timely warning for those who use too much alcohol. If the book will only promote temperance, it will do good.

Around the World.—By E. D. G. PRIME. New York: Harper & Bros.

A HANDSOME volume of 450 pages, being an account of a trip Dr. PRIME made not long ago. He writes in a pleasant way of many lands, and gives us a readable volume, if not so delightful as those from the pens of Hon. S. S. Cox and Mr. BROOKS. Much of the work is devoted to China, Japan, and India, subjects of special interest at this time.

The Conversion of St. Paul: By GEORGE JARVIS GEER, D. D., Rector of St. Timothy's Church. New York: Samuel R. Wells.

THREE sermons entitled, "Its Relation to Unbelief," "Its False Uses and True," and "Its Relation to the Church," comprise this volume. Mr. GEER has been a preacher of note for 25 years, and those who are interested in this subject will be pleased with the book he has produced. It makes a neat little volume of 82 pages.

Notes—Explanatory and Practical—on the First Epistle of Paul to the Corinthians. By ALBERT BARNES. New York: Harper & Bros.

A WORK so well and long known as this needs no introduction; it is a standard work, and this revised edition will commend itself to all who wish to study the Scriptures. The book appears in the usual form and style.

Animal and Vegetable Parasites on the Human Skin and Hair.—By B. JOY JEFFRIES, M. D. Boston: Alexander Moore.

A PRACTICAL, sensible little work, written by a man who knows his subject. It should find a place in every house, and be used as a text-book in all schools.

Trees, Seeds, Plants, Etc.

Trees and Shrubs.

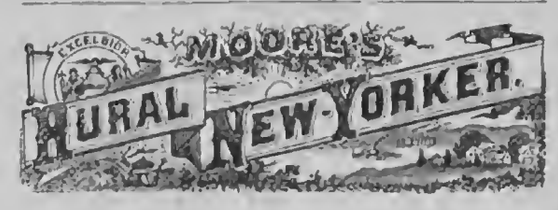
The Rural New-Yorker is sold by News Dealers generally throughout the United States and Canada at Six Cents. The Trade is supplied by the AMERICAN NEWS CO., 119-121 Nassau St., New York.

Advertising.—Inside, 75 cents per line, Agate space; Outside, $1 per line, each insertion. For Extra Display and Cuts, a price and a-half. Special and Business Notices, $1.50 and $2 a line. No advertisement inserted for less than $3.



SATURDAY, MARCH 23, 1872.

OUR SPRING CAMPAIGN!

A NEW QUARTER!

The Spring Campaign of the RURAL NEW-YORKER opens with March, and we desire every Agent, or other friend of the paper who can do so, to "pitch right in" and make additions to present Clubs, or form new ones—for which we Offer and Pay most Liberal Premiums.

TAKE PARTICULAR NOTICE THAT

Post-Masters and others will find it for their interest to add to present and form new clubs—for our inducements are so substantial that every one will be richly rewarded. Show the RURAL to your friends—take a copy to the polls on Election Day, (we will replace any you soil or lose,) and "don't forget to remember" to tell everybody you meet that this is *the* paper for themselves, their families and friends.

By proper effort, everybody can

MAKE MONEY IN MARCH!

For it is a good month to "*March On to Victory*," by filling up or forming clubs. As Spring comes on, thousands, in both Town and Country, want the RURAL, because it tells them all about Gardening, Floriculture, Arboriculture, Etc., as well as Farming, Stock Breeding, Sheep and Dairy Husbandry, &c., &c.

A NEW QUARTER.

A New Quarter of the RURAL begins April 6—a good starting point for new subscribers, renewals, etc. New clubs, and additions to present ones, are also in order. Good Friends! please note this and ask your neighbors to subscribe. We can supply back numbers from Jan. 1st, so that new subscribers can begin then, in April, or at any time desired.

RURAL NOTES AND QUERIES.

Rural Club Dinner.—Saturday evening, March 9th, the Rural Club met in its parlors at the Grand Central Hotel. President HORACE GREELEY'S benignant face shone upon the members like a full moon. At dinner he presided with dignity and grace, and commented most happily upon the impromptu speeches—for there were none others—made after the cloth was removed. Vice-President ELY reflected the complacent satisfaction on the face of the President, from the opposite end of the table. There were speeches by Mr. GREELEY, in which brief tribute was paid to the late JOSEPH B. LYMAN, who was present at the last meeting of the Club. At Dr. HEXAMER'S suggestion, Messrs. WELLS, WILLIAMS and CRANDALL were appointed a committee to prepare a memorial and resolutions relative to Mr. LYMAN'S life and death, to be presented at the next meeting. JOHN HENDERSON, the florist, talked of the growth of the flower trade in and about New York city, and asserted that the trade in cut flowers in New York exceeded that of London or Paris; but the same could not be said of the plant trade. Window gardening is not understood so well here, nor are growing plants deemed so essential in the homes of the humbler of our citizens as they are in those of the working people of foreign cities. H. T. WILLIAMS told again the story of the influence a single flowering plant had exerted in extending the cultivation of flowers in one neighborhood, and of the manifestly increasing desire among the people—especially among women and children—for instruction in practical floriculture. S. R. WELLS had seen, high up on the sides of the Rocky Mountains, in the windows of the hardy pioneers, flowers filling the homely homes with fragrance, and, on inquiry, had found that these rough though refined natures had clubbed together and sent to New York seedsmen for packages of seeds with which to garnish their homes with flowers, and remind themselves of the old homes where they first learned to love and think. Gen. HURLBURT paid eloquent tribute to the influence of flowers upon home life, and, with a refined builder's taste, urged the fresco-ing of public and private halls with the green garniture of vines and the radiant beauty of flowers. He had seen halls so decorated—festooned with ivy from the historical shrines to which travelers pay tribute in Europe. And he suggested that, in place of gilding and paint, it be made fashionable to fill our homes with living beauty. PATRICK QUINN had had a dream—which he told—concerning a woman's rights meeting, at which Mrs. WHITE OAK presided, and of which Mrs. SHELLBARK HICKORY was Secretary. It was attended by such distinguished persons as Mrs. BUR OAK, Mrs. PIN OAK, Mrs. BLACK OAK, and others of the Oak family; Mesdames ELM, CHESTNUT, MAPLE, PINE, FIR, BIRCH, BEECH, &c., &c., who insisted in entering protest against the wanton war made upon their right to live and influence the rising generation. They resolved against the cruelty and short-sightedness of mankind generally. Bachelor QUINN spoke with great eloquence in their behalf, and it was whispered, maliciously, that he was thinking of pear-ing with some one of them. Hon. GEO. GEDDES of Onondaga Co., won applause by talking of the progress of American Agriculture. In the parlors, after dinner, the Club resolved itself into conversational groups, which only separated at a late hour, after a most enjoyable reunion.

Agricultural Book-keeping.—P. H. WRIGHT asks us to give "the latest and best style of Agricultural Book-keeping." There is no later nor better style of keeping farm accounts than that known as Double-entry Book-keeping—precisely such as every man engaged in manufacturing or mercantile pursuits adopts. The adaptation of forms and titles of accounts will, of course, be varied; but the man who understands double-entry bookkeeping will have no trouble whatever in so recording his business that he may know, any hour in any day, what he is doing, what he pays for doing it, and what profits accrue in the end. The business education of farmers should be like that of men engaged in any other pursuit; and it should be regarded as essential that the farmer's boy, and girl, should have a thorough knowledge of book keeping, and the forms of business transactions, as that they should know how to add, subtract and multiply. There is nothing so mysterious about keeping books by double-entry that it is not possible to teach its principles and practical work to an intelligent man in two days. We have done that thing ourself, and know men who have kept their own books for years, after two days' practical instruction from us—and they doing an involved business, also. We do not mean to be understood, however, that we can teach *all* there is to learn in two days; nor can we explain the method in our columns; we have not the space. Every teacher of a district or public school should be able to teach, and every boy *and girl* should learn, book-keeping.

American Short-Horn Herd Book.—The eleventh volume of this standard authority—"containing pedigrees of Short-Horn cattle, with introductory notes by LEWIS F. ALLEN"—comes to hand while we are closing this paper for the press. It is a large and handsome volume of 1,160 octavo pages, contains 5,300 pedigrees, and about fifty fine lithograph portraits of first-class animals. The volume appears, from a cursory examination, to be an improvement upon its predecessors in several respects. Of course, we need not commend this work to breeders of Short-Horns—the simple announcement of its publication being all that most of them desire. The price of the volume is $10 per copy, by express, or $10.70 by mail, post-paid. Address LEWIS F. ALLEN, Buffalo, N. Y.

Trade Mark on Fruit.—We see from our exchanges that the South Haven Pomological Society of Mich., has established a trade mark which represents the credit of the society, and warrants the package, to which it is attached, to contain fruit of the first quality of that variety in every respect, and to be uniform throughout the package as it appears on the surface. Every man who ships produce should labor to make his name on a package mean the same thing.

Report of the Commissioner of Agriculture on the Diseases of Cattle.—T. G., Gorham, O., writes us that he has written the Member of Congress from his district for one of these reports, and received reply that "they had none on hand now." T. G. asks where they can be obtained. When the report was first made, it was published—how many copies, we are not aware. But June 3, 1870, a joint resolution of both Houses of Congress provided for the publication of 6,000 extra copies—1,500 for the use of the Senate, 1,500 for the Commissioner of Agriculture, and 3,000 for the House of Representatives. If there are none of these 6,000 copies obtainable from either Senators, Representatives, or the Commissioner of Agriculture, we do not know how they may be obtained. It is probable that many of them will, if they have not already, appear for sale in the old, second-hand bookstores of this city. We judge only by the fate of many of these Government publications.

James Stewart & Co., Kennett, Chester Co., Pa., who have been advertising live stock for sale in our columns, are, if we may judge by an exposure found in the Weekly Leader of March 9, 1872, published at Kennett Square, Pa., a swindling firm, or person, of the first water. The Weekly Leader says:

"We learn at the post-office that this scamp has been receiving mail at the Kennett Square post-office for six weeks, and that it has been forwarded to Westchester, Coatesville, Downington, Lancaster and other places, where he calls for it. He is evidently swindling people who send him money for stock. Let the postmaster look out for him, and have him arrested at once—he will *smash* the Chester White pig business."

Catalogues, etc., Received.—From WM. NEWTON, Henrietta, N. Y., price list of farm and vegetable seeds; from S. B. FANNING, Jamesport, N. Y., catalogue of choice farm and garden seeds; from W. E. STITT, Columbus, Wis., catalogue and price list of pure-bred poultry, also of choice seed corn, oats, wheat, etc.; from PFIFFNER & MARQUARDT, Delaware, O., price list of grape vines and small fruits; from W. B. WOODRUFF, Westfield, N. J., catalogue of flower bedding and vegetable plants; from A. B. ALLEN & Co., New York City, descriptive catalogue of live stock—imported and home bred.

Shipping California Fruit East.—The California Farmer, Feb. 15, announces that the Union Pacific R. R. Co. has decided to take no cars of fruit or perishable products by their passenger or fast trains, and it states—"This will be a serious blow to California fruit shippers, as it will effectually stop the sending of all our early fruits, such as Strawberries, Blackberries, Peaches, Apricots, Nectarines and Grapes, as these should go by the passenger trains."

Commissioners of Agriculture for Tennessee.—We see it stated that commissions have been issued (by whom?) to the following gentlemen, appointed Jan. 5th, as Commissioners of Agriculture, representing the three grand divisions of the State: HUNTER NICHOLSON, Knox County; THOS. CRUTCHFIELD, Hamilton Co.; ROBT. B. HURT, Davidson Co.; A. B. HAYNES, Shelby Co.; WM. H. JACKSON, Davidson Co., and J. B. KILLEBREW, Montgomery Co.

THE SEASON.

Greeley City, Col., March 7th, 1872.—This has been an unusual winter; the ground has been covered with snow from Nov. 17th until the last of February. Stock men will lose to quite an extent, not only by death, but by the severe storms which we have had, scattering their herds, causing their owners much cost looking them up and separating them from buffalo herds, with which they are sure to mix. Farmers have commenced plowing, and sowing wheat. The prospect now is that we shall need no irrigation to bring up early-sowed grain. The colonists are in good spirits, and intend to cultivate quite extensively the coming season.—V. DE. L. M.

Winona, Minn., March 8.—Winter commenced with us uncommon early—about the middle of November. With the exception of January it was very steady cold; not so much cold weather since 1857. Very good sleighing most of the time. No very unpleasant weather except the storm of the 13th of February. The railroads have not been obstructed with snow any to speak of, except some in the Northern part of the State. The snow in the valleys mostly left some three weeks since and the constant freezing and thawing, I should judge, has used up a large share of the winter wheat, of which there was a good deal sown. But it was so dry last fall that it got a very poor start. We are having now a great snow storm with strong East wind. Mercury little above 20°.

Lyndonville, Vt., March 5.—To-day is one of the most severe days to be out in that we have had this winter. The thermometer was down to about 20° below zero in the morning, and wind has blown a gale all day. The winter has been quite cold, on an average, and no thaws to speak of since snow fell, which was not far from the middle of November; since which time the sleighing has been very good with scarcely a day's interruption. From two to three feet of snow at the present time. Stock is looking well, especially sheep. Horses are in demand and bring good prices—$150 to $200 for good work horses. Hay is scarce and will be scarcer if this weather continues much longer—$20 to $25 per ton. Western corn can be bought at about 95c. per bushel, and will be used in considerable quantities by many Vermont farmers. The yield of oats was light the past season—affected more or less by the drouth; selling for 75c. per bush. Potatoes dull at 40c. per bushel. Wool high and store sheep in demand; very little wool in the country.—I. W. S.

Raleigh, N. C., March 13.—The past winter here has been unusually severe. An old citizen remarked this morning, "I am nearly eighty, and this is the worst winter I ever saw." The farmers have been unable to work much; the roads have been almost impassable at times; the frequent rains have kept the ground too wet for the plow, and the cold has kept back vegetation. It is hard on stock. A gentleman writes that the cry is for "funds and feed," but loudest for the latter. Gardening was commenced during the few favorable days in the latter part of February. All who were wise and ready, put in potatoes, peas, onions, &c., then. Some potatoes are now up; so with garden peas. But the weather in this month continues rainy and cold, and while I write, the drenched earth drinks in the pattering shower. In this market, prices are as follows: Wood, $4@4.50 per cord; flour, $8@12 per bbl.; corn, $1 per bush.; sweet potatoes plentiful, 80c. @$1; bacon, 8@17c. per lb.; eggs, 25c. per doz.; pork, 9@10c. per lb.; beef on hoof, 7@8c.; dressed, 10@15c.; chickens, 25 to 40c. each; butter, 25@40c.; hay, 75c.@$1 per cwt.; fodder, $1.40@1.75; oats, 85c. per bush.—N. C.

RURAL BREVITIES.

T. G. S., Logan, O., asks where he can get a full-blooded greyhound.

HENRY DICKERMAN, Ottawa, Ill., wants to know where he can buy Shetland ponies.

A CORRESPONDENT asks where he can obtain JUDSON'S Branching Corn. It is advertised in this paper.

LET the Norwich (Conn.) correspondent who asked for deer, address W. I. B., Box 87, Portsmouth, Va.

ORCHARD grass can be obtained of any seedsman, probably, advertising in this paper. Write direct to the seedsmen.

THE Ohio State Board of Agriculture is to give a Trial of Earth-Working Implements at Springfield, O., commencing June 18th.

THE Michigan State Relief Committe has contracted for 400 plows, to distribute among the destitute farmers of the burned regions of that State.

THE first shipments of spring clip of wool have been made from Los Angelos, Cal. Fine lots are contracted for on the ranches at 37 to 45 cents per pound.

"WATERWITCHING" is now an important staple for discussion in some of the Western agricultural journals. It seems to be generally believed that "there's something in it."

DR. J. DETMERS has resigned the Chair of Veterinary Surgery in the Illinois Industrial University, to accept a similar position in the Kansas State Agricultural College.

G. D. ROON will need a force pump for his well. RUMSEY & Co., Seneca Falls, N. Y., N. PAGE, Jr., Danvers, Mass., and, we think, others, have advertised these pumps in our columns.

THE aggregate of the wool product of California for the last year was 24,276,253 pounds, being an increase of nearly 5,000,000 pounds on the previous year. The clip this season is expected to be larger and of superior quality.

MRS. JOSEPH B. LYMAN, widow of JOSEPH B. LYMAN, late Agricultural Editor of the Tribune, proposes opening a seminary for young ladies at her residence, at Richmond Hill, L. I. For this Mrs. L. is eminently qualified, both in respect to the right conception of what education should be, and in ability to execute what she attempts.

PUBLISHER'S SPECIAL NOTICES.

March on During March!—Is what all our Agents, and others disposed to form Clubs, should do. It will not only pay to enlarge present Clubs but to form new ones. It is an easy matter to recruit for the new style RURAL, and PAYS both Agent and Subscribers—and now is the best time to do "that same."

Additions to Clubs are always in order, whether in ones, twos, fives, tens, or more. A host of people are subscribing for papers about these days, and we hope our Agent-Friends will give everybody an opportunity to subscribe for the best.

Show Bills, Specimen Numbers, Etc., of the RURAL NEW-YORKER sent free.

SPECIAL NOTICE TO ADVERTISERS.

INCREASE OF RATES.

AFTER April 1, 1872, the Rates for Advertising in MOORE'S RURAL NEW-YORKER will be as follows:

Inside, 14th and 15th pages (Agate space)	90c. per line.
" 5th, 7th, and 13 pages	1.00 "
Outside or last page	1.50 "
Fifty per cent. extra for unusual display.	
Special Notices, leaded, (by count)	2.00 "
Business "	2.50 "
Reading "	3.00 "

All orders for Advertising received at the New York office on or before April 1st will be charged at present rates only. For at least one cogent reason for our advance, or "New Departure," in Advertising Rates, see RURAL Feb. 24.

BUSINESS NOTICES.

DR. STRONG'S REMEDIAL INSTITUTE,

Saratoga Springs, N. Y., is unsurpassed in the treatment of Lung, Female and Chronic Diseases. Turkish, Russian, Electro-Thermal and Sulphur-Air Baths. Hydropathy, Vacuum Treatment, Movement Cure, Oxygen, Calisthenics, &c. TERMS LOWEST IN WINTER. Send for a Circular. Endorsed by Bishop Janes, Rev. T. L. Cuyler, D. D., and Tayler Lewis, LL. D.

Rough, Wintry, Changeable Weather produces Catarrhs, Coughs, Lung Disorders, &c., which DR. JAYNE'S EXPECTORANT as promptly cures when faithfully administered.

HOW TO OBTAIN A "COLLINS"

Solid *Cast* Cast-Steel Plow for $5. For particulars, address COLLINS & CO., 212 Water St., N. Y.

THE WAKEFIELD EARTH CLOSET.

Get Descriptive Pamphlet at 36 Dey St., New York.

The Sweet, Fixed Oil of the Cocoanut is represented in Burnett's Cocoaine.

Social Topics.

THE PLANTAMOUR COMET—A REASSURING VIEW.

"NATURE" quiets the apprehensions of the public, with regard to the Apocryphal comet of the Geneva astronomer, after the manner following:—"We have reason to know that many weak people have been alarmed, and many still weaker people made positively ill, by an announcement that has appeared in almost all the newspapers, to the effect that Professor Plantamour of Geneva, has discovered a comet of immense size, which is to 'collide,' as our American friends would say, with our planet, on the twelfth of August next. We fear that there is no foundation whatever for the rumor. In the present state of science, nothing could be more acceptable than the appearance of a good large comet, and the nearer it comes to us the better, for the spectroscope has a long account to settle with the whole genus, which, up to the present time, has fairly eluded our grasp. But it is not too much to suppose that the laymen in these matters might imagine that the discovery would be too dearly bought by the ruin of our planet. Doubtless, if such ruin were possible, or indeed probable—but let us discuss this point. Kepler, who was wont to say that there are as many comets in the sky as fishes in the ocean, has had his opinion indorsed in later times by Arago, who has estimated the number of these bodies which traverse the solar system at 17,500,000. But what follows from this? Surely that comets are very harmless bodies, or we should have suffered from them long before this, even if we do not admit that the earth is as old as geologists would make it. But this is not all. It is well known that some among their number which have, withal, put on a very portentous appearance, are merely the celestial equivalent of our terrestrial 'windbags'—brought down to their proper level they would have shrunk into very small dimensions indeed. But there is more comfort still. The comet of 1770 positively got so near to Jupiter that it got entangled among his moons, the diameter of the smallest of which is only some two thousand miles; but the moons pursued their courses as if nothing had happened, while the comet was so discomfited by the encounter that it returned by another road—*i. e.*, astronomically speaking, its orbit was entirely changed. While, last of all, in our correspondence this week, will be found one fact the more in favor of the idea that, in 1861, we actually did pass through a comet. We have a suggestion for those weak people who are still alarmed by these celestial portents, and steadily refuse to acquaint themselves with the most elementary work on astronomy, which would convince them how groundless their fears are. In India, during the last eclipse, the priests reaped magnificent harvests from the offering of the faithful. In England, possibly it would be considered incorrect to make such offerings to the priest; but let them still be made to the Royal Astronomical Society. In this way the English Philistines would approach nearer the standard of his less civilized brother; science would be benefited, and, doubtless, the omens would be averted—at all events, they already have been.

FURNISH GOOD READING.

ONE of the pleasantest and noblest duties of the head of the family is to furnish its members with good reading. In times which are past it was considered enough to clothe and feed and shelter a family. This was the sum of parental duty. But lately it has been discovered that wives and children have minds, so that it becomes necessary to educate the children and furnish reading for the whole household. It has been found out that the mind wants food as well as the body, and that it wants to be sheltered from the pitiless storms of error and vice by the guarding and friendly roof of intelligence and virtue. An ignorant family in our day is an antiquated institution. It smells of the musty past. It is a dark spot which the light of the modern sun of intelligence has not reached. Let good reading go into a home, and the very atmosphere of that home gradually but surely changes. The boys begin to grow ambitious, to talk about men, books, the past and the future. The girls begin to feel a new life opening before them in knowledge, duty and love. They see new fields of usefulness and pleasure. And so the family changes, and out from its number will grow intelligent men and women, to fill honorable places, and be useful members of society. Let the torch of intelligence be lit in every household. Let the old and young vie with each other in introducing new and useful topics of investigation, and in cherishing a love of reading, study and improvement.

SUCCESS MAKES ENEMIES.

THEY who are eminently successful in business, who achieve greatness, notoriety in any pursuit, must expect to make enemies. So prone to petty jealousy and sordid envy is poor human nature, that whoever becomes distinguished is sure to become a mark for the malicious spite of those who, not deserving success themselves, are envious of the merited triumph of the more worthy. Moreover, the opposition which originates in such despicable motives is sure to be of the most unscrupulous character; hesitating at no iniquity, descending to the shabbiest littleness. Opposition, if it be honest and manly, is not in itself undesirable. The competitor in life's struggles, who is of true mettle, deprecates not opposition of an honorable character, but rather rejoices in it. It is only injustice or meanness which he deprecates; and it is this which the successful must meet, proportioned in bitterness, oftentimes, to the measure of success which excites it.

THE CHRISTIAN GENTLEMAN.

HE is above a mean thing. He cannot stoop to a mean fraud. He invades no secret in the keeping of another. He betrays no secrets confided to his keeping. He never struts in borrowed plumage. He never takes selfish advantages of our mistakes. He uses no ignoble weapons in controversy. He never stabs in the dark. He is ashamed of innendoes. He is not one thing to a man's face and another behind his back. If by accident he comes in possession of his neighbor's counsels, he passes upon them an act of instant oblivion. He bears sealed packages without tampering with the wax. Papers not meant for his eye, whether they fluttered at the window or lie open before him in unguarded exposure, are sacred to him. He invades no privacy of others, however the sentry sleeps. Bolts and bars, locks and keys, hedges and pickets, bonds and securities, notices to trespassers, are none of them for him. He may be trusted alone, out of sight, near the thinnest partition—anywhere. He buys no offices, he sells none, he intrigues for none. He would rather fail of his rights than win them through dishonor. He will eat honest bread. He tramples on no sensitive feeling. He insults no man. If he have rebuke for another, he is straightforward, open, manly. He cannot descend to scurrility. In short, whatever he judges honorable, he practices towards every man.

SUCCESSFUL EDITORS.—AN English writer says: "A good editor, or competent newspaper conductor, is like a general or a poet, born, not made. Exercise and experience give facility, but the qualification is innate, or it is never manifested. On the London daily papers, all the great historians, novelists, poets, essayists and writers of travels have been tried and nearly every one has failed. 'I can,' said the late editor of the London Times, 'find any number of men of genius to write for me, but very seldom one man of common sense.' Nearly all successful editors are of this description."

A WORTHY QUAKER thus wrote:—"I expect to pass through this world but once. If, therefore, there can be any kindness I can do to any fellow-being, let me do it now. Let me not defer nor neglect it, for I will not pass this way again." Were all to act thus many would be made happy.

SO GOES THE WORLD.

OUR varied days pass on and on,
Our hopes fade unfulfilled away,
And things which seem the life of life
Are taken from us day by day;
And yet through all the busy streets,
The crowd of pleasure-seekers throng;
The puppets play, the showman calls,
And gossips chat the whole day long,
And so the world goes on.

Our little dramas come to naught;
Our lives may fail; our darling plan
May crumble into nothingness;
Our firmest castle fall to sand;
And yet the children sing and dance,
The money-makers laugh and shout,
The stars, unmindful, still shine bright,
Unconscious that our light is out,
And so the world goes on.

The house grows sad that once was gay,
The dear ones seek their Blessed Home,
And we may watch and wait in vain
To hear their well known footsteps come.
And yet the sunlight checks the floor,
And makes the summer shadows long;
The rosebuds at the casement bloom,
The bird pours forth his cheerful song,
And so the world goes on.

And God goes on, and with our woe
Weaves golden threads of joy and peace;
Guarding with His heart of hearts
Our days of pain, our days of ease:
He marks them all—the seed, the sheaves,
The danger's smile, the mourner's tears—
And keeps them safe, His children all,
Through all the great eternal years,
And so, thank God, the world goes on.

Our Story-Teller.

BEFORE AND AFTER.

A THRILLING ROMANCE OF THE WAR FOR THE UNION.

Written Expressly for Moore's Rural New-Yorker, BY TWO WELL-KNOWN AUTHORS.

[Continued from page 195.]

XI.—Living in New York.

MRS. HEATHERSTONE did not like New York, neither did MARGARET, for that matter, but the elder lady found vent for her dissatisfaction in expression, and in some unaccountable way appeared to hold MARGARET responsible for her unhappiness. The second floor of a little brick house in the lower part of the city had been secured for the wanderers till better days should bring better quarters. Their landlady—a queer little woman, who occupied the rest of the house—was outwardly prickly, but inside good enough, provided one ever reached the inside. MARGARET, with HANNIBAL as body-guard, had started out house-hunting on the day of their arrival in the city, and had decided upon the location of this particular house as desirable, if the inside should correspond with the outward aspect. The landlady herself came to the door, and, with a grim glance at the gray old negro, asked MARGARET her business.

"Do you keep Irish help?" she inquired, sharply, after hearing the young lady's explanation and showing the rooms; "if you do, this is no place for you. I won't let one of the creatures cross my threshold."

"HANNIBAL, here, will be our only servant," answered MARGARET, meekly.

"I don't like blacks either," the old lady continued, looking at poor HANNIBAL in a suspicious sort of way, evidently not quite understanding how he could serve as "help."

"Very well," said MAGGIE, turning away and beckoning to her old friend, "then we will try somewhere else."

HANNIBAL stood for a moment, uncertain whether to turn or remain; then, with a decided expression on his good face, he turned to the woman, who was just about closing the door, and said earnestly:

"Now, Missus, don't mind ole HANNIBAL. He be noting more nor less dan an ole dog. He be brack, but den he no make heself. De LORD ALMIGHTY fetched him into de world, and Missus wouldn't do no such ting as find fault wid de LORD."

Evidently this view of the case had never presented itself to the old lady's mental vision, for, instead of slamming the door in his face, as MARGARET confidently ex-

GRANDFATHER'S VISIT.—(Page 203.)

pected, she half moved aside from the entrance, and, considerably emboldened, HANNIBAL said, persuasively:

"If he be brack, HANNIBAL no drone; Miss MARGARET here can tell ole Missus dat. He hab no dirt round where he be."

The landlady began to have a dawning consciousness that the old man might be of service to her, and then her tactics changed.

"Well, 'spose you take another look at the rooms. I dont believe you'll get better suited. So you stay with them all the time?" she said to HANNIBAL, taking in at one glance the odd cleanliness of his appearance.

"Oh yes, Missus, HANNIBAL stay wid dem to de end, please de good LORD. But he not be in de way. He strong and willing, and he take great pleasure in helping ole Missus any time;" and the antiquated beaver was lifted with a reverence that flattered the landlady immensely.

This little skirmish ended in an engagement of the premises, and MAGGIE and the faithful servant went back to the hotel, and to Mrs. HEATHERSTONE and HARRY, full of enthusiasm about the bright little home they would soon have. The encounter with Mrs. GREEN, the landlady, was faithfully served up for the delectation of "mamma," but the poor lady saw little to amuse in the adventures of her daughter with a vulgar woman.

"I suppose I ought to try and be satisfied, if I can have the rest of my children near me, and SUSAN to wait on me when I am ill; but there's one comfort, it won't last long;" and Mrs. HEATHERSTONE went off into her regulation paroxysm of nervous weeping.

MARGARET left her mother with SUSAN, and taking HARRY, went out to show him the new premises, and to arrange for settling in the little home as speedily as possible. There is a sort of enthusiasm and piquancy in making much out of little, that the rich never know. One grows really happy in comparing, planning and selecting, provided there is no mean feeling of envy to combat with, and no desire to please other people at the expense of one's self-respect. There is a pleasure in attending to all the little details, and surprising ourselves with the extent of our own resources, that is never known to the rich, who give an order and find everything perfect. MARGARET had no idea of her ability, till she began to furnish her new domain, and HARRY could never praise her enough for her taste, her patience, her invention, and everything else that a woman could, by any stretch of the imagination, be supposed to possess.

"O, woman, in our hours of ease,
Uncertain, coy, and hard to please;
When poverty gives us a grip,
She takes the helm and steers the ship."

"How's that for a parody?" said HARRY, gaily, to Mrs. HEATHERSTONE, as MAGGIE sat on the bare floor of the little parlor, in No. ——, sewing the seams of a pretty ingrain carpet.

Mrs. HEATHERSTONE did not smile in reply. She never smiled now-a-days. "I'm glad," said she, "that you and MAGGIE are so gay over our misfortunes. It's better that you should be, and natural, I suppose; you are young and full of hope. I have nothing to hope for. If I could see poor ALFRED once more, I should be ready to die."

"O, mother," said HARRY, "it's too bad to be always making clouds. See, you have made MAGGIE cry," and HARRY went out of the room, indignant, saying in his heart that he'd like to know if the woman hadn't always been ready to die. As far back as he could remember, when her family were all around her, she had been the same limp, hopeless woman, with nerves and a headache. "Poor MAGGIE will have a hard time," he went on thinking, "but I must be mother and brother and husband, all in one. The dear girl! Who would have thought her capable of so much independence, and possessed of so much resource?"

In spite of the cross-grained quality of Mrs. GREEN, she proved to be a stanch friend, lavishing on SUSAN, in particular, more kindness than one would have supposed her capable of giving.

"I always hated niggers," said she to her one day, confidentially, watching HANNIBAL as he hobbled down stairs after coal; "but that good old man don't seem like one of 'em. He's black enough, though, goodness knows. Do you know," she continued, profoundly, "I begin to think that the real niggers are well enough; it's the mixing that spoils them. These yellow, half-and-half things I abominate, don't you?"

SUSAN listened patiently, remembering that she was only an eighth "thing." It had been arranged in the family that SUSAN'S birth should be unknown in her new home, and she was believed to be a cousin of the HEATHERSTONE'S — a Mrs. HARTWELL, whose husband had died in the Southern army.

While MAGGIE and HARRY were selecting furniture, manufacturing lounges and easy chairs, fitting carpets and hanging draperies, feeling something of the pride and importance of proprietors, NED was on his way to the Western town where HOPE, now almost hopeless, worked day by day in her little private school. More discouraged than usual, she had dismissed her last class, and had gone to her boarding place, feeling that it would be sweet to go to sleep that night and never wake again. She had been home but a few minutes when the servant announced—

"A gentleman for you, Miss."

"For me?" the poor child ejaculated, as if that were an impossible thing. Then a wild thought of ALFRED flashed through her brain, and with her heart beating tumultuously, she went down to the parlor.

"O, NED!"

"O, HOPE!"

"Didn't you expect me, darling?" said NED, after the first tears and kisses and fond ejaculations were over. "I wrote you a week ago that we were all in New York."

"No, NED, I didn't expect you, I had given up expecting anything. The last time I heard from you, you were in the hospital."

"And didn't you receive my letter from Virginia, when I was at the HEATHERSTONES'?"

"No. It is very strange; and not so strange after all; for letters often miscarry. I have you at last, safe and well. But ——"

HOPE couldn't finish the sentence, only with the imploring look in her sad eyes.

NED understood. "No," he said, his voice tremulous with sympathy, "I can tell you nothing of ALFRED."

"I shall never see him again," said HOPE.

"That is not certain. There is always hope, till you absolutely know to the contrary. There are a thousand ways by which we might lose trace of each other, and he still be living. Take courage, dear HOPE. Be yourself. Be HOPE. We can't tell what the future may bring. Only think what today brought you. You're glad to see your poor, harum-scarum Ned, are you not?"

"O, so glad! And I was so discouraged when you came."

"That is the moment when the relief comes—the moment of deepest trial. You see, I'm turning philosopher. But I've learned a great deal since you saw me, HOPE darling."

"Sorrow is a stern teacher, NED; but she teaches what no one else can. We ought to learn all her lessons patiently; but I am getting tired of the discipline. Oh, I was tired; I'm so much happier now, since you came."

"But, HOPE, how about business?" said the boy, giving his sister a little hug in acknowledgment of her last sweet words. "Can you give up your school and go to New York with me? MAGGIE is dying to see you."

"It is impossible to give up my school immediately. The term is out in four weeks, and I can, in the meantime, make arrangements to go back with you, if you come for me then."

"Certainly, little sis. And I will spare no pains to find some trace of our lost boy. We shall find him, be sure."

After a two days' visit, during which time NED told HOPE all his experiences, in field and hospital; all about MAGGIE and the HEATHERSTONE trials, and she had, in turn, confided to him all that had been so long shut up in her lonely heart, the brother went to New York to lay plans with HARRY for the support of their loved ones. He found the little family cosily established, and hopeful, with MAGGIE as director, and SUSAN and HANNIBAL brave and able co-adjutors. Through the assistance of old friends of the ARNOLDS, NED and HARRY secured clerkships in a large, up-town house, and entered cheerfully upon their duties, looking forward to a brighter day, when they should open a business for themselves.

"I shall look after you, boys," said old Mr. GRANT, who had used his influence in their behalf. "A good clerk will make a good man of business, and *vice versa*. You need training. If you stand that well, why then——" Here the old man winked and went away.

"Dat means money," said HANNIBAL, when HARRY told the story before him of the old fellow's patronage. "Dose winks be mighty fat tings when de millionnaires 'dulge in um. No need for you and Massa NED to fret. HANNIBAL allus know'd dis family come up when de time come."

"But, HANNIBAL, we're not up very far yet."

"Just de same ting, 'zactly. If you hab de seed, and do de right ting wid de seed, it de same as if you hab de fruit. Now, dat ole Massa GRANT, he gib you de seed already."

This philosophy could not be gainsayed, and the boys began their work with stout hearts.

It wanted but a week of the time of HOPE'S coming, when NED went to the St. Nicholas one night to meet an old friend, and on turning the leaves of the register listlessly, after having satisfied himself of his friend's arrival, his eye suddenly fell upon the name of ALFRED HEATHERSTONE. The date was a week back. "He has been here and gone South," thought he; and then turning almost fiercely to the clerk, he demanded some explanation, telling him in a few words of his great anxiety.

The clerk remembered nothing that could satisfy the questions so eagerly poured out. But after an hour's investigation it was ascertained that a man, looking so sick that it did not seem possible he could live a week, had registered himself, through his servant, as ALFRED HEATHERSTONE, had staid at the hotel two days, keeping his room all the time, and had left to go no one knew whither.—[Concluded next week.

ANECDOTE OF ALEXIS.

A CHARACTERISTIC story is told of the Grand Duke Alexis, who is in the naval service. A year or two ago, when holding the rank of midshipman, the flag-ship in which he was serving was wrecked on the coast of Denmark. The admiral ordered the life-boats to be lowered, and directed Alexis to take charge of the first boat. The royal midshipman declined to obey the order. It was peremptorily repeated — "I, your commanding officer, order you into the boat."

"Admiral, I cannot obey you," said the young prince. "It would not become the son of the emperor to be the first to leave the ship. I shall remain with you to the last."

"But I shall put you under arrest for disobedience of orders as soon as circumstances will allow me to do so."

"I mean no disobedience, I cannot obey," was the reply.

Four or five of the crew perished in the transit from ship to shore, and the admiral and Alexis were the last to land. In hastily constructed tents the rigid discipline of ship-life was promptly resumed. The young prince was placed under arrest for disobedience of orders. The Russian minister at Copenhagen was informed of the facts, and telegraphed them to the emperor, from whom he received the following reply:—"I approve the act of the admiral in placing the midshipman under arrest for disobedience of orders, and I bless and kiss my son for disobeying them."

GENUINE ELOQUENCE.

LEITH, in his travels in Ireland, says: "In my morning rambles, a man sitting on the ground, leaning his back against the wall, attracted my attention, by a look of squalor in his appearance which I had rarely observed, even in Ireland. His clothes were ragged to indecency, and his face was pale and sickly. He did not address me, but having gone a few paces, my heart smote me, and I turned back.

"If you are in want," said I, with a degree of peevishness, "why don't you beg?"

"Sure, it's begging I am," was the quick reply.

"You did not utter a word."

"No! Is it joking you are with me, sir? Look here!" he said, holding up the tattered remnant of what had once been a coat, "do you see how the skin is speaking through the holes in my trowsers, and the bones crying out through my skin? Look at my sunken cheeks and the famine that's staring in my eyes. Man alive! isn't it begging I am, with a hundred tongues?"

FRIENDSHIP has the skill and observation of the best physician, the diligence and vigilance of the best nurse, and the tenderness and patience of the best mother.

GREAT events may be traced back to great thoughts, which stand to them in the same relation as obscure progenitors to illustrious descendants.

HE that is good will infallibly become better, and he that is bad will as certainly become worse; for vice, virtue, and time, are three things that never stand still.—*Colton.*

LITTLE THINGS.—As daylight can be seen through very small holes, so little things will illustrate a person's character.

Sabbath Reading.

A PATRIOT'S PRAYER.

GOD, who shields our noble Land
Spread o'er Summit, Vale, and Strand,
Holy Hope, and Peace for all.
Hear this prayer, inspire the Soul!
Be our Faith as pure and true
As the Heaven's spotless blue,
And let Charity abound
Everywhere—the world around.
Keep us peaceful, glad, and free,
Glorious in Liberty!
Home of Freedom, ever grand,
God protect our happy Land!
And as Science shall ascend
Human Errors to amend,
And as Knowledge lifts the veil
Human Follies to curtail,
And as Thought in full array
Shall give action proper sway,
And as Liberty of Speech
Shall as Virtue's Beauties teach,
So, Oh God! let all rejoice,
Praise Thee with a Nation's Voice!
Let us not by feeble Hands
Bind to us all other Lands;
But let Soul to Soul be bound
Uncontrolled by Charts or Sound;
O'er the Earth, where Man doth dwell,
Let our Hearts in Friendship swell.
Keep us peaceful, glad, and free,
Glorious in Liberty:
Home of Freedom! our own Land,
God preserve thee ever grand!

[*J. D. Reymert.*

BELIEF IN GOD AN INSTINCT.

Some who have called themselves philosophers have said that society is artificial—the natural condition of man being that of seclusion and solitude, and social existence being a device to avoid certain inconveniences and secure certain comforts. This theory, if it ever found serious acceptance, was long ago given up. It is acknowledged that the individual by himself is not complete; that we are naturally, as well as by grace, members one of another. Solitude is, therefore, one of the shortest roads to the mad-house. The marvelous gift of language, the instrument of social intercourse, is the testimony of nature that we exist for this end; for it is hardly probable that this wonderful power was given us that we might indulge in soliloquies. Place a human being in utter solitude; suppose him to be ignorant that other beings like himself exist—the sense of loneliness, the vague but intense craving for social converse, the deep yearning of his soul, testify that he is out of his element, that he has lost part of his being. There is an unfulfilled exertion, a searching, unresting desire. So it is in respect to religion. The state of man without religion, without God, is similar. Our belief in God does not appear at first in the form of a deduction, in the form of a proposition, but in the form of trust, reverence, fear, gratitude, supplication, in the form of dependence and obligation; in the same way that the social instinct makes itself manifest in the child reaching out and groping for another.—*Prof G. P. Fisher.*

THE PRECISE DATE OF CHRIST'S CRUCIFIXION.

A DISTINGUISHED German scholar, Herr Kelk, in a recently published work, considers that he has settled the true date of the crucifixion. He shows that there was a total eclipse of the moon concomitant with the earthquake when Julius Cæsar was assassinated on the 15th of March, B. C. 44. He has also calculated the Jewish calendar to A. D. 24, and the results of his researches confirm the facts recorded by the Evangelists, of the wonderful physical events that accompanied the crucifixion. His astronomical calculations also show that on the 15th of April A. D. 31, there was a total eclipse of the sun, accompanied, in all probability, by the earthquake spoken of in Matthew. This mode of reckoning is verified by another calculation, made by calculating backward from the great total eclipse of 1818, which also gives April 5th as the date of the new moon A. D. 31. As the vernal equinox of the year fell on March 26, and the Jews ate their Easter lamb and celebrated their Feast and Passover on the following new moon, it is clear April 5 was identified with Gisan 14th of the Jewish calender, which moreover was on Friday, the day of preparation for the Sabbath, and this agrees with the Hebrew Talmud, so that astronomy, archæology, traditional and Bible history seem to unite in fixing the date of the crucifixion at April, A. D. 31.—

NOT ENOUGH.—How many toil on, disquiet, and harass themselves, as if desperately struggling against poverty, at the same time that they are surrounded with abundance; have not only enough, but more than enough—far more, in fact, than they actually enjoy.

Ladies' Port-Folio.

CURIOUS SONG OF A LOVER TO HIS SWEETHEART.

YOUR face,	your tongue,	your wit,
So fair,	so sweet,	so sharp,
First bent,	then drew,	then hit,
Mine eye,	mine ear,	my heart.
Mine eye,	mine ear,	mine heart,
To like,	to learn,	to love,
Your face,	your tongue,	your wit,
Doth lead,	doth teach,	doth move.
Your face,	your tongue,	your wit,
With beams,	with sound,	with art,
Doth blind,	doth charm,	doth rule,
Mine eye,	mine ear,	mine heart.
Mine eye,	mine ear,	mine heart,
With life,	with hope,	with skill,
Your face,	your tongue,	your wit,
Doth feed,	doth feast,	doth fill.
O face!	O tongue!	O wit!
With frowns,	with check,	with smart,
Wrong not,	vex not,	wound not,
Mine eye,	mine ear,	mine heart.
This eye,	this ear,	this heart,
Shall joy,	shall bend,	shall swear,
Your face,	your tongue,	your wit,
To serve,	to trust,	to fear.

The lines may be read either from left to right, or from above downwards. They may also be read in various directions.

A KISS.

A KISS! Methinks 'twere born in heaven.
So full of bliss is kissing,
I fain would closely close my eyes
And fancy nectar from the skies
Were flowing to these lips of mine,
While closely 'prest, my love, to thine.
And least I lose the crowning bliss
That may obtain from one sweet kiss,
Again I closely close my eyes,
And sip sweet nectar from the skies—
Each link complete, not one were missing,
So full of bliss my love were kissing!

H. M. L.

ABOUT PETS—TO PARENTS.

IT is the hight of nearly every youth's ambition to possess some character of pets. There is nothing so valued as such by some, while others do not become naturally attached to them.

Girls, as well as boys, should have some kind of a pet. (I do not doubt but what some do consider themselves "possessors of pets," but not the *pets* I have reference to). Something to attract the attention of the youth from wearisome play, is what is necessary, and when a pet of some character is introduced the child is "made happy again." How pleasant it is to watch some little child at play with a pet dog, cat, lamb, or even a doll.

There is something of deep interest in the amusement of children and their mode of amusement. Yet it is often overlooked by parents, who allow their children to grow up from infancy to childhood, from this to young men and womanhood, without even giving them the opportunities of amusing themselves with such as would both instruct and amuse them.

Much is to be learned by associating with pets, for humanity to animals, and kindness, are cultivated in the child's heart. Besides, it accustoms the children to outdoor exercise, which is the free and profitable access to good health. Give the children pets to amuse themselves with, and there will be no difficulty in their rising to a high standard of culture in the matter of kindness to dumb animals.

Trusting these words will be duly noticed by parents, I submit them for their perusal. B.

HOME SURROUNDINGS.

IN the proceedings of the Montgomery Co., Ohio, Horticultural Society, we observe that Mrs. Major KNITZ has been lecturing the men on making the surroundings of home beautiful. In a late address on "Our Homes," she sketched from her own observation what she saw of the surroundings of Warwick Castle, in England, the magnificence of which can scarcely be conveyed in language, and then of the home of Felicia Hemans, a cottage known as the "Dove Nest," made charming chiefly by the taste displayed in the grounds about it. She contended that there was no home that might not be made beautiful by floral ornamentation, and enforced it as a duty incumbent upon the poorest man. She dealt heavy blows upon a certain class of men who cut down fine old forest trees and build expensive houses which blister in the sun for a generation. Examples of this kind were visible around Richmond. Shadeless houses with bay windows, without porches, standing in ten-acre lots, broiling beneath the sun. Have we not many such about Dayton? Mrs. K. said that the money spent for the filthy weed would make the poor man's home a little paradise. She denounced the practice of whitewashing trees. Nature always supplied the proper colors. In her estimation it was as absurd as putting white pantalettes upon the legs of a bedstead.

A SECRET FOR WOMEN.

MANY women, who, before marriage, made it their study to please the eyes of the men they wished to marry, lose their affection after marriage by carelessness in dress. Men are fastidious in this matter. Even those who are careless in regard to their own appearance, take delight in seeing their wives neat in their attire. They miss those coquettish garments, the neatly dressed hair, and all the thousand tasty and fanciful little articles with which young women adorn themselves, more than they would be willing to allow. The neatness and order which charmed them, too often gives place to a slovenly morning grown, frowsy hair, slipshod and unlaced shoes, and the like. Men reason that they should have the same desire to please the man they have chosen after marriage as well as before it. The last new song loses its charm coming from the lips of a slattern.

The poetry goes out of life at a glance, and the household loses its brightness. The wife who, on account of household cares, neglects her personal appearance, commits a grave mistake, which, too often, bears bitter fruit, and they see their husbands leave their society for that of others, without really knowing the cause, and most men are too proud to tell them. Let women always give the same care to their dress after marriage which they give it before, and not rush from the room to "dress up" only when there is a prospect of "company." Let them consider that that which gives them a charm in the eyes of their friends, has a like effect upon a husband, and they will see that he will not have so many pressing business calls "down town" in the evening, but will have the same delight in their society as in their days of courtship.

PRACTICAL WOMAN'S RIGHTS.

THE Estherville (Iowa) Vindicator thus tells how the women of that village recently manifested their power and influence:

Last night was one of the most, if not the most eventful night ever witnessed in Estherville. The two saloons in this place had become obnoxious to some, and of that number the women formed the greater, and, as it has proved, by far the more resolute and stronger portion. Mutterings have for some time been heard against the dealing out of intoxicating beverages. And last night the women of this place, to the number of twenty-five—mothers, daughters and wives from the most worthy families of the place—proceeded, without warning, to the objects of their dislike, and after slight resistance offered at the saloon, made quick and effective work in the demolition of casks, decanters, jugs, bottles, etc., and poured the contents into the street. For a distance of over a block the gutter was swimming whisky, and the interiors of the saloons presented a scene of ruin that one seldom beholds in a community. After completing the work they had set out to do, the ladies quietly returned to their homes. But they still manifest their determination to persevere in this performance whenever it may become necessary.

HOW TO PUT CHILDREN TO BED.

NOT with a reproof for any of that day's omission or commission. Take any other time but bed-time for that. If you ever heard a little creature sighing or sobbing in its sleep, you could never do this. Seal their closing eyelids with a kiss and a blessing. The time will come, all too soon, when they will lay their heads upon their pillows, lacking both. Let them at least have this sweet memory of a happy childhood, of which no future sorrow or trouble can rob them. Give them their rosy youth. Nor need this involve wild license. The judicious parent will not so mistake my meaning. If you have ever met the man or the woman whose eyes have suddenly filled when a little child has crept trustingly to its mother's breast, you may have seen one in whose childhood's home dignity and severity stood where love and pity should have been. Too much indulgence has ruined thousands of children; too much love not one.—*Fanny Fern.*

THE highest and most characteristic glory of earthly beauty is to make us aspire to a heavenly one; and a woman is great in proportion to the ideal she suggests.

Reading for the Young.

"WHEN THE COWS COME HOME."

BY MRS. MARY E. NEALY.

I LOVE the beautiful evening,
When the sunset clouds are gold,—
When the barn fowls seek a shelter,
And the young lambs seek their fold:
When the four o'clocks are open,
And the swallows homeward come;
When the horses quit their labors,
And the cows come home.

When the supper's almost ready,
And JOHNNY is asleep,
And I, beside the cradle,
My pleasant vigils keep,
Sitting beside the window,
Watching for "pa" to come,
While the soft bells gently tinkle
As the cows come home.

When the twilight and the sunlight
In mingling hues are blent,
I can sit and watch the shadows
With my full heart all content;
And I wish for nothing brighter,
And I long no more to roam,
When the twilight's peace comes o'er me
And the cows come home.

I see their shadows lengthen
As they slowly cross the fields,
And I know the food is wholesome
Which their generous udder yields.
More than the tropic's fruitage—
Than marble hall and dome—
Are the blessings that surround me
When the cows come home.

GRANDFATHER'S VISIT.

GRANDFATHER was a dear, good old man, who always came to our house two or three times a year, to pay mother a visit. He was an old-fashioned gentleman, with rosy cheeks, sparkling blue eyes, and white hair. He used to wear black velvet breeches, which fastened below the knee, and thus held up a pair of flesh-colored stockings. He had queer, old-fashioned shoes, with square toes, and big buckles. His presence in our house was always like a gleam of sunshine, for he was sure to tell us strange stories, and usually he brought a box with him, full of *bon bons*, cakes, preserved fruits, and sweet things, good to eat, which he bought in the city where he lived.

If you look at the picture on page 201 you will see me, as I used to be when I was a little girl, standing in front of Grandfather, waiting for him to open his box. It is just in the edge of the evening, and GRETCHEN is coming in with a waiter, on which there is a lighted candle, a cup of tea, a pitcher of milk, and a bowl of sugar. My little brother FRITZ is in front of GRETCHEN, with Grandfather's long Turkish pipe in his hand, for he knows very well that after tea the old gentleman will want a quiet smoke. Out of doors the rain is coming down, so you see leaning against the chest of drawers, Grandfather's blue-cotton umbrella. Seated in his big chair, he is just ready to open the long-looked-for box. Even Snow Drop, the little King Charles Spaniel dog, expects to get a mouthful of something good to eat, so he has put his paws on to Grandfather's knee, and is wagging his tail, waiting for the box to open.

"What a greedy dog you are!" I exclaim.

"How the lid to this box sticks," says Grandfather.

Then he spreads the napkin on his knee, and tries to open it again.

"Here am I, coming with your pipe," shouts FRITZ.

"Oh! do tell me what is in the box?"

Then Snow Drop, that's the dog, barks one sharp, short bark, he is so anxious to see a mouse hop out of the box.

Finally, the lid comes off, and we have such a jolly time eating all the ginger snaps, the cocoanut cakes, the tarts, the red sugar hearts, the sugar strawberries, the doll doughnuts, and rosy cheeked lady apples.

We spread them on the table, and draw up our high chairs, and sit down with Grandfather, helping him eat his supper. Then he tells us a story of how he used to do when he was a little boy; all about the Indians, and shooting deer in the woods, and being chased by wolves when he went to the mill to get some seed-corn to plant, and a great many other things, after which we kiss the sweet old man good night, and jump into bed. And this is the story of Grandfather's Visit.

OUR LETTERS FROM BOYS AND GIRLS.

Willie C. B. P, of Chicago, Ill., asys: "I have a squirrel. One of the hired men on a farm at Waukegan caught it on the trunk of a tree. I brought it home with me, to the city, and now it is very tame. It will sit on top of one's head and eat corn or any thing else it likes. It will run all over you. Once it went into my pocket after corn. One night my father caught its head in the crack of a door; we thought it was dead; we sprinkled water on it, and my uncle poured camphor on his hands, and rubbed them together to make it strong, and held them over its nose and it sneezed, but did not open its eyes for several days. When it recovered it seemed to be as wild as when I first had it, and we had to tame it again. The morning of the "great fire" we were carrying it out in the cage, and it got out, but we caught it. While crossing the street after leaving the house it got out again and ran under my mother's shawl, and I caught it. Now we have it safe in our room. We have taken the RURAL NEW-YORKER two years and like it very much."

Mattie W., of Williamsport, Pa., says: "Maybe some of the girls will like to take impressions of pretty ferns and grasses, and if they do, I will tell them how. After they are gathered, press them carefully; and when well pressed, arrange them as gracefully as possible on a piece of white cardboard. Fix them at one or two points with pins, driving them as short a distance in as you can, for fear of perforating the cardboard until it will show. Take a soft toothbrush and wet it, and rub India ink upon it; draw it carefully over the back of a knife blade, or one prong of a hair-pin, so as to spatter *fine* black dots all over the exposed portion of the paper. You can make it any shade of gray you like, from very light to almost black. When you impin the grasses and remove them, you will be surprised at the perfect little beauty you have made by such simple means.

"I wish 'Wild Rose' would correspond with me."

Lydia O. of Tilton, Georgia, says:—"We are not very fancy folks, we all work. We milk two cows; we have two little heifer calves; they are very gentle. I have not got any pets but the little calves and the little birds. The birds are nearly tame. I go to school a while, and then I stay at home and work a while. My papa is a great man for work and honesty, and I am inclined to be like him. I have got a trap; I caught 45 partridges in it, 2 doves, 2 field larks, and I set all the small tribe free. We do not have any servants, we do our work ourselves. I have not read the RURAL through this week, but will finish it this evening. I think it is the most interesting paper my papa takes."

Homer S. says:—"I live in Albion, Erie Co., Pennsylvania. My father takes your paper, and likes it very much. I always look at the poultry part about the first thing. As to FRANK, the nut gatherer, I think my brother and I beat him a little on the chestnuts, as we got one and one-half bushels, off our own farm, too. My brother and I have lots of fun leading calves; but it isn't so much fun to take a yearling, as one gets jerked so much. In our yard there are several mountain ash shrubs, and into one of them we have grafted a pear cion, and it is growing nicely."

The Puzzler.

Aunt Phebe's Anagrams and Buried Cities, in RURAL of Feb. 24, are thus answered:

ANAGRAMS OF PEDIMANA.—1, Chimpanzee; 2, Orang-Outang; 3, Agile Ribbon; 4, Entellus; 5, Mandrill; 6, Marmosets; 7, Ruffled Lemur.

BURIED CITIES IN WISCONSIN.—1, Berlin; 2, Ripon, 3, Sparta; 4, Warsaw; 5, Waupun; 6, Green Bay; 7, Shawno.

News of the Week.

GENERAL REVIEW.

THE political event of the week has been the New Hampshire election, which took place after a very excited contest, and resulted in a great victory for the Republicans....The revolution in the management of the Erie Railway has surprised the country. The Gould-Tweed gang has been routed, and the road is now in the hands of competent and honest men. Gen. Sickles has the credit of giving the *coup de grace*... The Navy Department is to be investigated ...There has been much agitation in the French Assembly...Owing to the death of a juror, Mayor Hall is to have a new trial....Trouble is apprehended in Spain, and rumor says the King is preparing to defend his throne.

DOMESTIC NEWS.

New York City and Vicinity.

THE appearance of Andrew J. Garvey, as a witness in the trial of Mayor Hall, produced a great sensation. Garvey is to tell all he knows. Reports have been published of the flight of Connolly and the surrender of Tweed by his bondsmen. For an article which appeared in the Tribune, Mr. Joel A. Fithian, son-in-law of Connolly, attacked one of the Tribune editors. A hand-to-hand fight ensued... Owing to the sickness of a member of the jury, Mayor Hall's trial was postponed for a week....On the 9th of February, a mad dog bit six children in Brooklyn; one has since died....An attempt to blackmail Rev. Dr. Carter, by a fallen woman, has failed, the matter having been taken into the courts....Mrs. Brooker, a sister of Mrs. Woodhull, has lectured against Free Love....Specific charges have been brought against Judge Barnard ...On the 11th the Directors of the Erie Railroad held a meeting at the Grand Opera house, and elected Gen. J. A. Dix President, in place of Jay Gould. Most of the old Directors resigned, and new ones were elected,—gentlemen of worth and position being chosen. This change was not effected without great excitement, injunctions, a siege of the Opera House, etc. The end of the infamous Erie Ring has now been reached....Another verdict has been given against the Staten Island Ferry Co., and the steamboat Westfield has been seized by the sheriff . The insurance investigation continues, and testimony in favor of Miller has been given....On the 12th, Jay Gould resigned the Presidency of the Erie Railroad, and surrendered to the new order of things .. Foster is to have a new trial ...A Harlem Court House swindle, with $250,000 stolen, is reported....There was a snow storm on the 11th....Brooklyn is agitated over the ferry question, and mass meetings are being held.

Obituaries.

JOSEPH MAZZINI, the Italian Liberator, died on the 10th. He was born June 28th, 1807.

Miscellaneous Home News.

THE great building for the Centennial Exposition in Philadelphia, will cover fifty acres ....There has been great excitement in the oil regions of Pennsylvania, over the so-called Southern Improvement Company's monopoly. The people have finally triumphed, and will build new railroads ...It is asserted that vast quantities of silks, velvets, laces, and gloves have been smuggled into this country from the Canada dominion, through Calais, Me.... The Alabama and Chattanooga R. R. is to be sold on the 22d of April.

Miscellaneous Foreign News.

A NAVAL academy is to be founded at Kiel ...There have been earthquake shocks throughout Central Germany....It is proposed to declare Gomez President of Cuba....A coalition against the Spanish Government has been formed....A great meeting has been held in Madrid in favor of Amadeus ...An outbreak is expected in Seville... The King of Spain has reviewed the volunteers ..The Pope says the existence of two powers in Rome is impossible....The Italian Chamber has passed a resolution of regret for the death of Mazzini... Russia is seeking to reconcile the Poles, and rumor says the Grand Duke Alexis is to be the Viceroy of Poland... A direct cable is to be laid between Spain and England ...Prince Frederick Charles of Russia, is said to claim the throne of Spain... Switzerland has sent several agents to watch Italian revolutionists .. Cholera has broken out among the British troops in India ...Cuba is again reported tranquil....The King of Italy will review his troops in Rome in the presence of the King and Queen of Denmark, and Den. Moltke ...A good understanding between Italy and Germany, in reference to the clerical parties, is announced ....King Amadeus is concentrating his army around Madrid ... The people of Switzerland will ratify their constitution on the 12th of May ... A great landslide has taken place on the Ponto Railroad in Brazil, miles in extent. It will take two months to repair the damages.

Fires.

MARCH 6th, a number of steamships at Cincinnati were burned. Losses heavy... Woolen mill in Burrillville, R. I. Loss $30,000....House of Capt. Pratt in Brockport Center, Me., on the 6th. Loss $20,000....Store houses in Fitchburg, Mass., on the 6th. Loss $22,000... Stores at Lincoln, Ill., on the 7th. Loss $75,000....The monitor Mahopac has been damaged by fire....On the 9th seven dwelling houses in Jersey City .. Martin's Hall in Albany has been badly damaged....Three fires in Montreal on the 9th. Loss $40,000....Jewelry and bookstore in Indianapolis on the 11th. Loss $100,000.....Flour mill in Columbus, Ga., on the 13th. Loss $75,000....March 12, there was an extensive fire in Chester, Vt....In Petrolia, Ont., on the 12th, twelve wooden houses. Loss $20,000. ....In Hamilton, Canada, on the 12th, dry-goods house. Loss $37,000.

Accidents, Disasters, Etc.

ON the 7th, two miles from Buffalo, a train for New York was thrown into a ditch, and 14 persons injured....Three men were killed, and five wounded, by a boiler explosion in Moline, Mich ...The ship Great Republic, built in Boston, has been lost at sea while on its way from Rio Janeiro to St. Johns, N. B.

Crimes.

FIFTEEN Ku-Klux have been committed at Huntsville, Ala.... Farrell, who murdered Elliot at Wabash, Minn., is to be hung Sept. 6....The trial of Rev. W. Huston is in progress in Baltimore....An insane man attempted to murder his two sisters at Marlboro, Ulster Co., N. Y., on the 7th. He cut them badly....Prince Parker, 60, committed suicide in Worcester, Mass., on the 10th....James McNeale, 80, was murdered in Shelby City, Ky., last week... Wm. Wade killed Ed. Beben at Rosedale, N. Y., on the 8th....A mother and three children have been murdered near Dayton, Ohio....Samuel Furque of Greenbush, N. Y., shot his wife on the 12th, and then committed suicide.

Political.

THE French arms investigation continues at Washington... An attack has been made in the Senate on the Civil Service Reform....It is proposed to investigate the Navy Department.... The validating State's bond act is likely to pass the South Carolina Legislature....The Ohio temperance law is likely to pass in Wisconsin....The postage stamp investigation continues at Albany ....The Capitol investigation, at Albany, has closed. Charges not proven....The suits in Utah, commenced by the United States, will not be abandoned... New general order regulations have been issued for the New York Custom House, and Leet and Stocking are out of business ...A bill to abolish capital punishment has been introduced at Albany....The President has been granted $50,000 to carry out Civil Service Reform....John Tyler, son of the ex-President, has become a Republican....Election took place in New Hampshire on the 12th, with a sweeping Republican victory. Mr. Straw was elected Governor by some 2,000 majority... A bill has been introduced into the Senate to prevent the destruction of timber on public lands....Gen. John G. M. Parker is Surveyor of Customs at New Orleans, in place of Gen. Longstreet....The investigation of the case of Senator Wood, N. Y., has ended. The Tribune says he is convicted of receiving bribes ...The House has been discussing the proposed subsidy to the Pacific Mail Steamship Company....The bribery testimony taken in Kansas is to be sent to Washington....A bill creating a Board of Public Works for San Francisco was defeated in the California Legislature.

FOREIGN NEWS.

From Great Britain.

THE London Times now says the fifth claim for lossess, the transfer of the American marine to the British flag, must be abandoned....A shipping convention is being negotiated with the United States....The trial of the Tichborne claimant for perjury will take place in April . . Some 3,800 operatives in the Leek silk factories have been locked out....In Seaham 1,500 coal miners have struck....The Pope has made no request of England for a home ...Minister Schenck has held a reception in Edinburgh,... The Atlantic and French Cable Company have resolved to lay another cable to America ..The Queen leaves for Germany on the 26th ...The Cambridge and Oxford boat crews are training ....The Scotch Education bill has passed to its 2d reading....The American reply to Lord Granville's note has been received. It hopes for a settlement of the whole question....The postal telegraph authorities have been suppressing news. ....England gave £162,000 to Chicago.. It is reported that the American case will be presented at Geneva on the 15th of April, whether England withdraws or not....It is denied in the House of Commons that there is a secret treaty for the independence of Canada.... Murphy, the anti-Popery lecturer is dead....The Queen has granted a pension to the widow of Mark Lemon.... A scandal in high-life, concerning Lady Twiss, attracts attention....The Times thinks the Erie revolution will restore confidence in American enterprise. ..The compositors of London threaten to strike.

From France.

MANY changes are to be made in the diplomatic representation of the country....Emperor William has pardoned the French held for civil and military offenses....There has been an excited attack in the Assembly on the President. An Empire or chaos was predicted....The condition of the treasury is satisfactory....The Minister of Foreign Affairs has asked an explanation of Italy of the fortifications on the Genoese coast... There has been a great tumult in the Assembly over a motion to prosecute two Deputies for libel... The Prince of Wales has visited President Thiers. He has since gone to Cannes, and is in good health....In regard to the surrender of Metz the testimony is against Marshal Bazaine....There is no intention of selling the Suez Canal; traffic over it is largely increasing....Gambetta is going on a political tour through the country....A bill has passed the Assembly to make it a criminal offense to join the International Society....The army is to be reduced to 440,000 men.

The Secret of Captivation.—Features of Grecian mold, a well-turned neck and beautifully rounded arms, are no doubt very nice things to have, and ladies who possess these charms have reason to be thankful to Mother Nature; yet, after all, the most captivating of all womanly charms is a pure, fresh and brilliant complexion. This superlative fascination any lady may secure by using HAGAN'S MAGNOLIA BALM.

Watch No. 1105, Stem Winder—bearing Trade Mark "Frederic Atherton & Co., Marion, N. J."—manufactured by United States Watch Co., (Giles, Wales & Co.,) has been carried by me eleven months; its total variation from mean time being only seven seconds in the entire time.—A. H. KING, Vice-Pres't Elastic Cone Spring Co., N. J. Car Sp'g & R. Co., 7 Park Place, New York.

This very day will I send for free Price List of the $75 Four-Ton Hay Scale to the JONES SCALE WORKS, Binghamton, N. Y.

Over Fifty Thousand Blanchard Churns are now in successful operation. Pretty good proof that they are liked.

SPECIAL NOTICES.

RUPTURE CAN BE CURED

without suffering. ELASTIC TRUSSES are superseding all others. Before buying Metal Trusses or Supporters, send for a descriptive circular to the ELASTIC TRUSS CO., No. 683 Broadway, New York.

Perfectly Safe and worthy of *entire confidence* is the remedy known as *White Pine Compound*. It is very efficacious in Coughs, Colds, Pulmonic Affections, and all affections of the Kidneys.

THE MARKETS.

MONEY AND TRADE AFFAIRS.

NEW YORK, Saturday, March 16, 1872.

TRADE continues active in Foreign Goods, and also in Domestic Cotton Goods. The spring business will prove 10 per cent. larger than last year. The Export movement is light this week, both from New York and the Southern Cotton ports. The Cotton receipts are light, and the price, both here and at Liverpool, is singularly weak on short crop estimates. It seems doubtful whether we shall be able to spare two million bales to Foreign markets out of the current crop, while the Domestic mills will require about 1,100,000 bales. The look of the Export trade is unfavorable, in view of the unprecedented Imports. We have now from the Bureau of Statistics at Washington the results of the Foreign Trade for the first five months of the current Fiscal Year, of which the following is a summary:

FOREIGN TRADE, UNITED STATES—FIVE MONTHS.

Imported goods in gross	$230,654,655
Re-exported to other markets	5,635,181
Total, as for U. S. markets	$234,019,471
In bond, June 30, 1871	$68,324,630
In bond Nov. 30, 1871	65,024,862— 3,299,768
Total taken for consumption	$237,319,238
Exports American produce, gold value	153,610,584
Trade balance, July 1 to Nov. 30	$83,708,654
Exported in domestic specie	$23,599,931
Exported in foreign specie	4,300,503
Together	$27,900,494
Less foreign, imported	5,362,493
Net outgo of specie	22,637,001
Apparent balance against United States	$61,071,683

COMPARISON WITH CORRESPONDING MONTHS.

	July 1 to Nov. 30, 1871.	July 1 to Nov. 30, 1870.
Goods for consumption	$237,319,268	$189,020,058
Produce exported	153,610,584	139,512,155
Regular trade balance	$83,708,684	$50,407,903
Net specie outgo	22,637,001	37,720,808
Apparent balance	$61,071,683	$12,687,095

The event of the week in Stock affairs is the revolution in the Direction of the long unfortunate and deeply wronged Erie Road. This movement was as unexpected as it was ably planned, by parties in the interest of the English Stockholders. Gen. Sickles has the credit of engineering the affair, which, though threatened for a day or two by complicated legal difficulties, was accomplished, and the new Board of Directors, with Gen. John A. Dix at the head, duly legalized, leaving Mr. Jay Gould powerless for future mischief. The new Directors proclaim themselves to be only a Provisional Board until a new election, under the bill about to become a law at Albany, in July next. This deposition of Gould, and the recent violent death of Fisk, have broken the Erie Ring, and it only remains to be seen whether the property, so long the sport of their desperate speculations, can be resuscitated to a Dividend paying basis, without years of reform and economy.

Money continues in demand at 7 per cent. at Bank, and 8@10 per cent. on the Street.

The following are the comparative movements of the City Banks for the past fortnight:

	March 2.	March 9.
Capital	$87,155,500	$87,155,500
Loans	282,280,100	281,342,400
Gold and Greenbacks	62,101,000	63,687,100
Deposits	210,472,800	210,333,000
Circulation	28,165,100	28,122,000

PRICE OF STOCKS AND BONDS.

American Gold	110¼	N. Y. Central Scrip	94½
U. S. 5-20's of 1867	112	Reading	113¾
U. S. 6s of 1881	115½	Rock Island	113¼
U. S. 10-40s, 5 ₰ cts	108	N. West	78½
U. S. New Loan	109	Do. Preferred	91¾
N. Y. Bounty Loan	107¾	St. Paul	59¾
Tennessees	66½	Do. Preferred	79¾
Virginias, new	57	Lake Shore	92¾
Missouri Bonds	94½	Ohio and Mississippi	45¾

Union do	91¾	Union Pacific Stock	36¾
Western Telegraph	71¾	Adams Express	96
Pacific Mail	62	American Express	75
N. Y. Central Stock	93½	United States Exp's	74½

No change worth noting has occurred from our previous table of quotations in U. S. Stocks or Gold. The principal change in the Railroads is a rise of 5 per cent. in Erie Common Stock, and about 10 or 12 in the Preferred Stock, the latter selling up to 76½ per cent. The other roads barely hold their own on a dullish market. Reading and Rock Island are 1 per cent. lower. The Express Stocks have made a further large advance; 2 per cent. on Adams, 5 on American, and 5 on United States. The Southern States Stocks are dull, except South Carolinas, which have advanced to 35½ per cent.

PRODUCE AND PROVISIONS.

NEW YORK, Friday, March, 15, 1872.

Beans and Peas.—The arrivals of beans have been very small, and with a good consumptive trade prices are very strong. Canada peas sell close up to the arrivals. Green quiet. Sales at $1.24@1.25 for Canada; $1.90@2 for green; Southern blackeyed $3 per two-bushel bag.

Butter.—An unexpected continuation of the activity alluded to in our last, has developed a most satisfactory state of affairs in the butter market. Prices have advanced, and the steady favor that sellers have obtained in prices, has not had the least effect in diminishing trade. We omit quotations for Western, except rolls; these sell readily, when choice, at 22c. Grease has advanced.

State dairies, fine, 32@34c.; State dairies, fair to good, 28@31c.; State, half-tubs, good to fine, 34@37c.; State, do., common to fair, 25@30c.; State, firkins, fine yellow, 30@32c.; State Welsh, good dairies, 30@32c.; State do., common to fair, 24@28c.; State do., fresh made, 34@36c.; State, fancy select tubs, 38@40c.; rolls, good Western, 20@22c.; common to fair, 12@18c.; grease butter, 10@10½c.

Cotton.—The market is lower and unsettled. The Liverpool news is unfavorable, and limits the export movement. The demand for contracts also is restricted.

	Uplands.	Alabama.	N. Orleans.	Texas.
Ordinary	19¾	19¾	19¾	20
Good Ordinary	20¾	21	21¾	21¾
Low Middling	21¾	21¾	22	22¼
Middling	22¼	22¾	22¾	22⅞
Good Middling	23	23⅜	23¾	23¾

For forward delivery latest sales on the basis of low middling are as follows:—April, 22c.; May, 22⅜c.; June and July, 22¾c.; Sept., 22c.; October, 19½c.

Cheese.—The season is winding up very satisfactorily to holders. Quotations to-day, 20c. for fine factory. Some few of the trade think that notwithstanding the light stocks, there will be some difficulty in clearing the markets at the high prices, as the consumptive trade is likely to decrease, and the season for new make is close at hand. Speculators, however, are still at work, and this is evidence of some faith in present high prices at least being supported. The shipments for the week foot up 131,000 pounds, mainly made up of Canada that have passed through in bond. Quotations are for fine State factory, 20c.; good do., 18@19c.; ordinary, 14@16c.; State farm dairy, prime, 17@19c; Vermont factory, 18@19c.; Ohio factory, good to fine, 17@18½c.; English dairy, 16@17c.; pineapple, State, 17@19c.

Eggs.—Supplies steadily increasing, prices have declined. Receipts are about 1,500 bbls. a day. Present prices are likely to rule for several days, as reports from the interior show that shipments are not excessive. In some directions stock is turned largely to markets where prices are relatively higher than here. Sales at 22@23c. for Southern, 23@24c. for Western, 24c. for State and Pennsylvania.

Flour.—The market has been very dull and low, and medium grades are lower.

We quote at $5.30 @ $6.30 for superfine State; $6.50@6.75 for common extra do.; $6.80@6.90 for good to choice do.; $6.95@7.30 for fancy do.; $5.90@6.50 for superfine Michigan, Indiana, Ohio, Iowa, &c.; $6.45 @6.75 for extra do.; $6.80@7.40 for choice extra do., including shipping brands of round hoop Ohio at $6.70 @7.00, and trade brands of do. at $7.05@7.65; good to choice white wheat extras at $7.45@7.80; Minnesota, fair to very choice extra, at $7.00@8.50; St. Louis at $6.75@7.40 for common to fair extra, and $7.65@9.50 for good to choice. Southern at $6.50@7.65 for extras and $7.90@9.50 for good to choice. Rye at $3@3.50.

Fresh Fruits.—The market is dull, and prices but slightly changed. We quote:

Apples, good, barrels, $3.75@4; do. selections, $4.25; do. poor, $2.75@3; cranberries, common, bbl., $5@7.50; do. crates, fine, $4; do. do. common, $3@3.12; oranges, La., bbl., $14@15; peanuts, Wilmington, fresh., $2@2.20; Virginia, new, $2@2.20; do. common, $1.25@1.50; hickory nuts, $1.75@2; Pecan nuts, 9@9½c.

Grain.—Wheat meets with a light trade, and prices are lower. No. 2 spring in store, $1.48@1.51, No. 1 do., $1.52@1.55, winter red Western, $1.62@1.68, amber do., $1.70@1.72, white Western, $1.70@1.80. Corn is in active demand and firm, at 68½@69c. for new Western mixed, afloat; 69½@70c. for Western yellow; 69c. for old Western mixed. Oats are dull and weak, at 53½@55c. for Western; 58@59c. for white Western. Barley is steadily held; sales at 70@75c. for two-rowed State; 85c. for six-rowed do. Rye sold at 88c. for Western.

Hay and Straw.—We have had very small receipts and holders have been enabled to secure little advanced prices. The improved market is looked upon as only temporary, as, with the mild weather, there is every probability of an early resumption of river navigation. With this view supplies are worked off as promptly as possible at the current figures. Sales are making at $1.25@1.30 for shipping, and $1.35@1.70 for retail qualities, the latter price obtainable only for strictly choice lots. Long rye straw, $1.05@1.15; short rye do., 90@95c.; Oat, 85c.

Hops.—Supplies are moderate especially of primo stock; with fair trade from brewers, prices are firm.

New Yorks, growth 1871, 25@35c.; Eastern do. 1871, 25@60c.; Western do. 1871, 25@60c.; yearlings do. 1870, 10@30c.; olds do. 1869, 10@15c.; old olds do. 1868, 8@12c.; Californians do. 1870, 15@30c.; Californians do. 1869, 9@15c.; Bavarians, 75c.; English, 15c.; Belgians (nominal), 55c.

Poultry and Game.—Dressed and live poultry, except geese, are selling fairly for the season with a moderate supply and good prices. In game, wild pigeons are the novelty, but as yet scarce.

Turkeys, Western, good, 16@18c.; do. poor and frozen, 12@15c.; do. State, 17@18c.; do. Jersey, 20@21c.; Ducks, Western, 16@18c.; do. poor and frozen, 12@16c.; Fowls and Chickens—Western good, 16@18c.; do. poor and frozen, 14@16c.; do. State, 18@19c.; do. Bucks Co. and N. J., 21@24c.; capons, 30@32c. Ducks, Western, 20@22c.; do. poor and frozen, 15@20c.; do. State and L., 22c. Live, State and N. J., 18@20c. do. Western, 16@18c.; roosters, 10c.; ducks, per pair, 75c.@$1.50. Geese.—Western, $1.50@1.75; do. Canada, $1.75@2; do. Jersey, $3@3.50; turkeys, 19@21c.

GAME.—Rabbits per pair, 35@45c.; hare do., 40@50c.; canvas backs $2, red head $1.25, mallard $1, widgeon and teal 50@60c.; black duck, 75c.; English snipe per doz., $4; squab per doz., $4; wild geese each $1.

Seed.—Clover is decidedly lower. The shipping demand is very light. Good and prime Ohio, 8½@9c. Prime Mich. and Indiana, 9½c. Timothy has declined to $3, with sales at that price.

Tobacco.—Business is limited to small parcels and no trade of consequence is looked for until we have larger supplies of the new crop.

Vegetables.—Potatoes are firmer for best grades. The comparatively low prices for them this season has worked the supply down materially, and better prices will soon rule for Peach Blows, good Jackson and Dyright. Onions have a shipping demand, and are firm. Bermuda Tomatoes will now come regularly. Almost 3,000 boxes have arrived, the best selling at $1 per five-quart box.

Potatoes, Early Rose, bbl., $2.25@2.50; P. Blows, $2.50 @2.75; Prince Albert, $1.75@2; Mcalter and Goodrich, $1.25@1.50; Jackson, $1.50@1.75; Dyright, $1.50@2; Nova Scotia, $1.75; sweet Del., $3.75@4.00. Onions, red and yellow, $1.75; white, $2.50@3; Conn., 100 strings, $2.50 @3. Garlic, per 100 bunches, $20@22. Turnips, Russia, bbl., $1.25; flat, $1@1.25. Cabbages, per 100, $5@7. Hubbard squash, per bbl., $4; marrow, $4. Beets per 100, $1.25. Carrots per 100, $1.50.

Wool.—The market is without animation. Stocks of fleeces are so small that holders name almost any price they please. Pulled are offered sparingly unless at full prices. California grades meet with light attention. Foreign are inquired for at full prices. Latest sales are at 65c. for unwashed combing; 90c. for combing delaine; 57½c. for unwashed Western; 86c. for combing pulled; 85c. for tubbed; 40c. for burry Texas; 38@40½c. for full clip Cal'a; 41½ for lambs do.

Whisky lower with large receipts. Western, 86½c.

ROCHESTER, N. Y., March 14.—Wheat is active, but prices favor the buyer. We quote red winter, $1.50@1.55; white, $1.90@1.75. Corn dull at 70c. Oats, 43@46c. Barley lower and dull, at 60@65c. for two-rowed, and 70@75c. for four-rowed. Beans, are quiet, $1.50@2.25 for common to choice. Dressed hogs, $6@6.50 per cwt. Butter scarce, and 2@3c. higher, selling 26@28c. Cheese is also higher, selling at 17@18c. Eggs dull, at 24@25c. ₰ dozen. Potatoes quiet, 50@55c. Timothy seed, $2@3.50; clover, $5.75@6.25. Wool firm but nominal, at unchanged rates. Sheep pelts higher, quoted at $3.50@5.00 each. Hay lower and in good supply, at $16@23 per ton. Other articles unchanged.

COUNTRY CHEESE MARKETS.

Little Falls, N. Y., March 16, 1872.

THE market at Little Falls for the week ending March 16th, is without material change for struggling lots of farm dairies occasionally coming in. The advance of the factories in the city to 17½@18c. has its effect in strengthening prices here. The transactions are very light, and are confined to farm dairies. We hear of no new cheese coming into market, but some farmers have been making since last of February. We have advices from abroad for the 3d week in Feb. Our London correspondent reports stocks of American cheese small, and prices very firm. American extra, 71s@72s.; fine, 70s.; good, 64s@68s. The other descriptions of cheese sell as follows: Cheddar, 72@90s.; Wiltshire double, 60@74s.; Cheshire medium, 56@68s.; fine, 76@84s.; Scotch, 66@74s. Dutch Cheese—Edams, 60@68s.; Gondas, 50@59s.; Derby Shape, 54@60s. Butter is active for fine and good; inferior not salable. We give quotations as follows:—Clonmells, 132s.; Corks, 136s.; Normandy extra, 168s.; Canadian, 90@110s. The corresponding prices for butter and cheese last year were as follows:—Clonmells butter, 156s.; American cheese, 78s. Dairy farmers in Central New York feel very much encouraged as to the prospect of the market for the new make of cheese soon to come forward.—X. A. W.

LIVE STOCK MARKETS.

NEW YORK, March 15, 1872.

THERE has been quite an increase in receipts all round, during the past week, and the markets are less firm. As spring advances, we have a good many substitutes for meats. The shad season has opened, eggs are plenty, and wild fowl begin to appear on sale. The low price of eggs is calculated to draw off from meat more than anything else. Veal is quite plenty, hog-dressed calves fairly glutting the market. The soft weather and rain of last night operate against the sale of beef, and large quantities of dressed sides are selling below what they cost alive. The season of spring

lambs is just opening, and there will be a rush for them at high prices.

TOTALS LIVE STOCK FOR THE WEEK.

	Beeves.	Milch Cows.	Calves.	Sheep.	Hogs.
This week	7,962	182	873	19,759	27,286
Last week	6,250	126	880	16,373	25,024
Correspond'g w'k '71.	5,195	54	917	18,781	14,529
Average, '71	7,187	88	2,301	25,132	25,177

Beeves.—With 1,900 more cattle than were received during the previous week, the market has been fairly active until near the close, and prices were well sustained. An advance of through freights to $100 per car load from Chicago, would either make cattle worth more here or less in the West.

There were 4,200 cattle on sale last Monday—130 cars at Communipaw, 45 at 100th st., and 40 at Weehawken. Butchers took the whole of them, buying the more readily on account of good quality. We are getting very few Texans this spring, but some of the Mo. and Ind. cattle are in thin flesh. The average quality is rather above that of former years. Since the receipts of Monday we have had 2,330 head, of which 81 car loads were at Communipaw yesterday. Some of the sales were 45 fat 8 cwt. Ill. steers at 12c., with some others of same weight at 12½c.; 55 thin 6¾@7¼ cwl. Mo. steers at 10½@11c.; 18 Texans 6¼ cwt. at $60 each; 191 O. still-fed steers, 6¼ cwt. at 11¼c. These were the first stillers of the season. The market closed with some stock left.

Milch Cows.—The fresh cow trade continues depressed, the receipts running ahead of the demand. Good springers sell at $60@75 each; poor cows still go at $25@40 each, fine milkers reaching $70@75. One lot of 32 head, rather ordinary, averaged $55 per head.

Veal Calves.—These are coming in more plentifully. Especially is the market full of dressed calves, and prices are lower. As though in anticipation of a decline, farmers are sending in stock as fast as they can, much of it in poor condition. The season of "bob veal" is also at hand. These latter are not quoted, being a sort of contraband article, but are sold more or less on the sly, subject at any time to being confiscated. Live calves are quoted at 7@10c. for thin to prime, with dressed at 10½@13c.; few extras, 13¾c., and 7@9c. for fed calves.

Sheep.—Receipts are larger, and prices about ½c. lower. A few spring lambs have been received, but they are not quotable, fancy prices being obtained. The sheep trade is slow at 7@8c. for quite poor to thinnish stock, 8½@9c. for fair, and 9¼@10c. for good to prime. The arrivals are quite irregular just at present, interfering with trade, while a lull in the wool market causes a dullness in pelts. Some of the latest sales of sheep were 3 cars fine-wool State, 108 lbs. at 10c.; 2 cars 101 lbs. Ky., 9c.; 3 cars Ill. 85¼ lbs., 8½c.; 1 car 83 lbs., 8c. The average of 8,698 head sold last week was $8.38 each, with 802 at $7.97.

Hogs.—In addition to the 27,287 live hogs there were 5,000 dressed received during the week. Save a decline in Western there is no particular change in prices, scarcely anything selling alive though they are quoted at about 5¾c. City slaughtered are worth 6¾@6¾c.; Western dressed, 5¾@5¾c., and are dull.

"FAMILY FAVORITE!"
THE
WEED. **WEED.**

The most perfect, reliable and generally useful machine in existence. For the family of the farmer or mechanic, where the work required of a sewing machine ranges from the heaviest garments of men's wear to the most delicate and ornamental fabrics for ladies and children, it has proved itself thoroughly efficient and entirely satisfactory. Of unequaled simplicity and compactness of construction, capable of being learned and operated with one-fourth the usual expenditure of time and labor, with a capacity for quantity, quality and variety of execution beyond its competitors, and a reputation for durability and reliability known and appreciated by thousands, it is offered to the people for the most critical inspection and comparison, with confidence that its obvious merits cannot fail to convince the careful examiner of its superiority. Manufactured by the

The Nursery Favorite Safety Pin.
PATENTED 29th AUGUST, 1871.
BEAUTY, ECONOMY, UTILITY, SAFETY.
THE BEST AND MOST PERFECT PIN EVER MADE.
It takes 22 Inches of Wire to Construct One Pin.
IT OVERCOMES OBJECTIONS constantly made by those using other pins. Unlike them the wire is formed into a long and short spiral coil. The pin is pointed at the end and is of a triangular shape, which will allow it easily to penetrate one or more thicknesses of cloth. When confined, the sharp point is perfectly inclosed and secure, and cannot become loosened except by hand manipulation
THEY GIVE PERFECT SATISFACTION.
Liberal inducements offered to the Trade. Local and Traveling Agents wanted everywhere. One-half dozen pins packed in a neat little box and sent post-paid to any address on receipt of FIFTY CENTS.
DOOLITTLE M'F'G CO., 559 Broadway, N. Y.

FARMERS, DAIRYMEN AND BUTTER BUYERS!
PACK YOUR BUTTER
IN
WESTCOTT'S
RETURN BUTTER PAIL

Approved and recommended by the leading authorities of our country on dairying, and acknowledged by all butter dealers to be the very best package in use. Butter packed in this Pail brings **5 to 10 cents more** a pound in the New York City market than the same quality in any other package.

READ THIS:
NEW YORK, Nov. 15, 1871.

We, the undersigned, Produce Commission Merchants of the City of New York, consider Westcott's Return Butter Pail, manufactured by Silsby Bros., Belmont, N. Y., *the best package in the market*. It is our experience that Butter packed in this Pail *sells more readily and commands a higher price* in this market than in any other package, and we heartily recommend its general use by the dealers, dairymen and butter buyers who ship to this city.

Respectfully,

(Signed by 45 leading Commission Merchants.)

The Westcott Return Butter Pail meets my approval as a good butter package. It is one which I always feel safe in recommending.

X. A. WILLARD,
Dairy Editor Moore's Rural New-Yorker.

Dairymen, send for a Circular! Dealers, send for a Price List! We are the sole manufacturers of **Westcott's Return Butter Pail**, and also manufacture very extensively Butter Firkins, Half-Firkin Tubs, 25-pound Butter Pails, Well Buckets, &c., &c.

CARHART'S
PATENT TWO-HORSE
Pulverizing Cultivator
Was Awarded the First Premium at State and County Fairs in 1870 and '71.

It is superior to the best Wheel Cultivator.
The price is only Twenty Dollars.
The draft is reduced nearly one-half.
The depth you wish it to run is regulated without the use of wheels.
It can be drawn close to a tree or plant without injuring it.
It is not disturbed by short undulations of earth, like the Wheel Cultivator, but pulverizes, levels and fits the ground for the Mowing Machine better than any Cultivator in use, and can be used for more purposes than any other implement on the farm.

C. C. BRADLEY & SON, Man'frs,
Syracuse, N. Y.

Not to be Paid for until Tried.

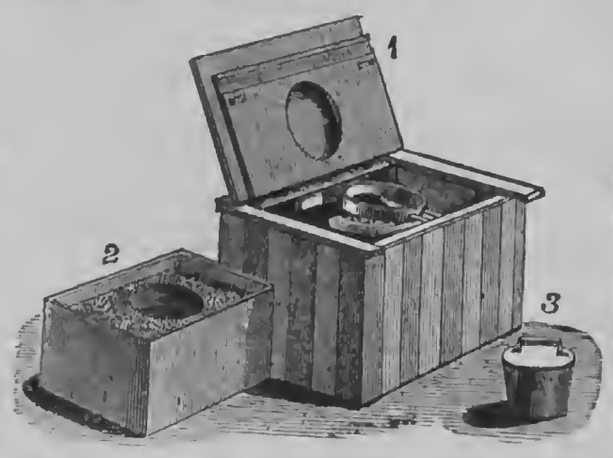
PUBLIC HEALTH PROMOTED! AGRICULTURE BENEFITED!



GOUX'S
PATENT ABSORBENT CLOSET & URINAL.

"The Goux system possesses all the advantages of the dry earth system without its disadvantages; it is economical, deodorizing and self-acting. The whole refuse of every house, as excreta, liquid or solid, ashes and sweepings, are disposed of and turned to account, and it is applicable in individual cases, dwellings, and in large communities. The alterations to the ordinary closets, to adapt them to the dry system, are less costly in the Goux process than in any other, and it is applicable to the best description of houses, as well as to the dwellings of the poor."—*Scientific American, Jan. 1, 1872.*

Paints, Oils, Blacking, &c.

ARE YOU GOING TO PAINT?

MORE THAN

100,000 HOUSES

HAVE BEEN PAINTED WITH THE

AVERILL CHEMICAL PAINT

IT IS THE BEST

In the world for exterior work upon Cottages, Villas or Buildings of any kind, whether built of brick, wood or iron. It is a liquid, *ready for use*, and requires no oil thinning or drier. Purest white, and any desired shade can be had in packages from one gallon upwards.

Letter Received from Levi Shaw, Trustee of the United Society of Shakers.

MT. LEBANON, N. Y., Sept. 27, 1871.

RESPECTED FRIENDS:—In reply to your inquiry as to what we think of the Averill Chemical Paint, we have used in our Society at Mount Lebanon some 1,000 gallons. We are very much pleased with it, and until we are convinced that there is something better, shall give it the preference of all other paints. We have used heretofore the (——), (——), and most all other brands of white lead, neither of which have given us perfect satisfaction. Most of it would chalk off after being on some two or three years. This, after three years' experience, we do not find to be the case with the Averill Pure White Chemical Paint. Indeed, it appears just as well as when first put on. I will write you again on the subject when I am not in quite so much of a hurry.

Sample card of beautiful colors, and recommendations from owners of the finest residences in the country, furnished free by the

AVERILL CHEMICAL PAINT CO., 32 Burling Slip, New York, or 118 Superior St., Cleveland, Ohio.

P. S.—The superiority of these Paints has already brought numerous *worthless* imitations in the market. We caution the public against using them.

WEBSTER'S PATENT
BUTTON-HOLE WORKER.
Patented June 27, 1871.

One of the most important inventions of the age! The most perfect Button-Hole Worker ever invented!

So simple that a child can work a more perfect button-hole with it than the most experienced hand can work without it. Every stitch is taken with the most perfect mechanical accuracy. Is used entirely independent of the sewing machine, and will last a life-time. Does away with pricking the fingers, straining the eyes, and with imperfect and irregular worked button-holes. They give universal satisfaction. Ladies who use them say that they are worth their weight in gold. Over 11,000 sold during the first week of their introduction. The most liberal inducements offered to the trade. Dry Goods and Fancy Goods Merchants find it an excellent selling article. Local and traveling agents wanted everywhere.

Samples and terms, with full directions for use, sent prepaid on receipt of 50 cents. Orders by mail receive prompt attention. Address
GEO. DAVIS, Successor to
A. W. Webster & Co., 239 Broadway, N. Y.

Arboriculture.

PALM AVENUE AT RIO JANEIRO.

HEREWITH is given an illustration of the magnificent Palm Avenue in the Botanic Garden, Rio Janeiro. The Palm of which this grand avenue is formed is the *Orcodoxa regia*, a variety distinguished for its lofty trunk and terminal head of noble foliage. This avenue is unrivaled for its regularity, extent and beauty. It forms a colonade of natural Corinthian columns, whose graceful bright green capitals seem to support an over-arching dome of bright blue sky. The trees of which it consists, ten years ago were about sixty feet in hight to the top of the fronds, and were said to be between forty and fifty years of age. They are now probably seventy-five to eighty feet in hight. The trunk of each of them is about four feet in diameter at four feet from the ground, and it tapers gradually a length of more than fifty feet, when it becomes united with another smooth, and thinner trunk, from ten to twelve feet in hight, formed of the bright green foot-stalks of the leaves, which again measure twenty feet or more.

Mr. CROUCHER says: "In young vigorous trees the leaves are considerably longer. The great beauty of this palm is its elegance and cleanliness of aspect; no ragged leaf bents about in the wind, even at that great hight; the over-ripe yellow leaves unsheath themselves of their own accord, and the trees look as clean as if they had been trimmed by hand. The color of the stem is a whitish gray, like that of light stone in dazzling sunshine, and although from top to bottom it is covered with lichens of all the colors of the rainbow, yet so small are they that you only perceive them by approaching the tree. "In the same garden exists the parent of these palms, which was planted during the last years of the last century, and is now above 120 feet in hight. It is a noble tree, and, as it stands singly, and at a considerable distance from other plants, its beauty and hight can be seen to the best advantage."

PALM AVENUE AT RIO DE JANEIRO.

DIGGING HOLES FOR TREES.

I DESIRE to set out an orchard this spring and wish some information. What should be the dimensions of the hole to set apple trees, three years old, in? And how should it be prepared? I also desire the same information in regard to peach, pear and cherry trees. Perhaps you have given this information many times in your excellent paper; but I am a new subscriber, and have never seen it. Am also a new beginner on the farm, and have no knowledge as to how to proceed, but I desire to learn. If you, or any of your many readers, will give me a few hints, they will be thankfully received. J. O. W., *Mapleton, O.*

THE larger you dig the holes to receive the trees the better; but three to four feet in diameter will do, and one and a-half deep. If land is subsoiled before planting, then holes of less size will do. In digging the holes throw the top soil on one side and the subsoil on the other; then in filling throw the good soil into the bottom, and take good soil from the surface near the hole to fill in around the roots, and leave the poor earth to spread over the surface, and fill up any depressions made in obtaining good soil to put around the tree. The object is to get as deep a soil about the trees as possible. Set the trees only two or three inches deeper than they were in the nursery, and pack the soil very firmly about them.

Field Crops.

TOBACCO CULTURE IN KENTUCKY.

As I reside in a tobacco growing country, and have had opportunities of witnessing its growth and culture, and have had the pleasure of growing several crops myself, I thought a few notes to the RURAL NEW-YORKER, of "what I know about its culture," might prove of interest to some of its many readers.

Sowing the Seed.—A good start, they say, is half the battle; and just as soon in the spring as the ground will do to work, (which generally is in February,) select a piece of new land that lays fair to the sun, pile up large heaps of brush, or other combustible material, sufficient to burn the ground well; the next day, after burning your heaps, dig or spade those burnt spots well, thoroughly pulverizing the soil, and remove all fine trash and roots with a rake. A plat of ground ten feet square will raise plants enough to set one acre; a teaspoonful of seed will be sufficient to sow it. If you tramp or roll your beds after sowing your seed, it will make them earlier.

Soil and its Preparation.—The best soil here for the growing of fine, bright tobacco, is a hickory and oak soil, or soil in which those timbers are most abundant, which is generally a stiff, clayey loam. The first year's cultivating after clearing, is conceded by all to be the best for growing fine and light tobacco; and the second year, and sod land, for darker and heavier grades. Primitive soils, that are naturally rich, are better than any artificially-prepared soils. The ground should be well broken, rebroken and harrowed; if new ground, a coulter plow should be used. Mark your ground both ways with a one-horse plow, twenty-four by thirty-six inches, make a loose hill with the hoe in each check, and your ground is ready for the plants.

Transplanting.—From the 1st to 15th of June, if your plants have done well, they should be transplanted; if done any later than this, the plant has hardly time to mature. After a good shower of rain, you can transplant. Raise your plants carefully, one at a time, and set one in every hill, deeply; press the soil firmly around its roots. A back-aching will follow a good day's work, I can assure you, from experience.

Cultivation.—Keep the soil clear of weeds, and a loose hill to the plant. Plow at least three times, with one horse—once the narrow way. The bottom or ground leaves of the plant may be removed, so as to get a good hill to it, which should always be done with the hoe.

Topping.—Topping must be done as soon as the buttons are visible, and a few days sooner I believe is better, as it will make the top leaves heavier. Top it all as near one time as possible. For heavy-bodied tobacco—what might be called coarse-fibered—top to ten leaves; for fine tobacco, top to twelve and sixteen leaves, according to the strength of your soil.

Worm and Sucker.—After topping the tobacco, worms appear in myriads, and suckers for every leaf of the plant. All I can say under this head is, keep your tobacco free from each, which will require all attention until it ripens.

Cutting.—As soon as it is ripe, which may be known by its changing color, (having a spotted or brownish cast;) cut with a thin, sharp knife, by splitting the stalk from top almost to bottom; then, by holding the top firmly with one hand, lean the plant from you, and, by a light blow with the knife, you sever the stalk at the ground. Some hang the plant immediately, by placing it astride of a stick four feet in length, supported by a light, transportable rack. About eight well grown plants are enough for one stick; and when filled, it is placed on a wagon, with a frame high enough to keep the bottom leaves from touching the floor, and is hauled to the house and placed in tiers four feet wide, and the sticks from eight to ten inches apart.

Others cut and lay it carefully on the ground, and when wilted, lay it in small, straight piles, with the buts of the stalks to the sun; it is allowed to remain in the piles from eight to ten days, when it will be found to be of a beautiful yellow color. It is then hung and placed in the house as before. Have your house so constructed as to admit a free circulation of air in every direction.

Stripping.—As soon as the stalks become dark and the stems dry, your tobacco is ready for stripping. This should be done in damp weather, when the tobacco is said to be "in case." If help is scarce, it is a good plan to take it from the sticks and place it in a nice, compact bulk, stalk and all. This should be done when it is beginning to come "in case"—when the stems will crack when bent, but not break. If bulked when going out of "case," it will go out entirely, and will be a difficult matter to get it "in case" again. When bulked in the condition I before stated, a man can strip all the time, without waiting for it to come "in case," as you would have to do if it remained on the stick. Bulk it away as fast as you strip it, and you can prize it away in hogsheads or take it to market from bulk; for it will keep any length of time, when put away in this condition. J. T. P.

Lyon Station, Ky.

PEANUT CULTURE.

I WILL give my mode of culture and experience in this latitude. The peanut is very easily cultivated, and is a very profitable crop to grow for feeding purposes; it is the best feed for hogs that I know of, and will fatten them quicker than any other feed. I generally turn my hogs in the peanut field, and let them root for themselves. Hogs that are fattened on them, however, have to be put up in a pen and fed on corn about a week or ten days, in order to harden the flesh, as the peanut makes the fat oily; but it is the sweetest meat that we have.

I plant the peanut when I plow my corn the second time, in the corn rows; or, better still, I lay off my corn rows about seven feet apart, and at the second plowing of my corn, lay off a row between the rows of corn, and plant my peanuts, so that when I plow my corn the third time, I plow the peanuts; then, just as the peanuts begin to blossom, I give them a good hoeing, and that is all that is required. I plant the peanuts about one and a-half feet apart in the drill. It does not require a rich soil to grow them; our poorest, thinnest land suits them best, and they improve the land more than anything else I know of; for after I dig what I want for seed, I turn in my hogs, and they root up the ground to find the nuts. Thus the land gets a thorough breaking up, and the vines are turned under by the hogs; and by next spring they are rotted, and the ground is in fine condition to plant again. Thus I can improve my land more and more each year, and still cultivate it.

The vines also make the best of long forage for horses and cattle; for, by pulling the vines when the nuts are ripe, and allowing them to cure in the sun one day, and then stack or house them, you have a fine supply of forage—better than hay or fodder, and relished much more by the stock.

Taylor Co., Fla. JAS. H. WENTWORTH.

FIELD NOTES AND QUERIES.

Twelve Good Varieties of English Potatoes.—ROBERT FENN names and recommends the following English potatoes, which we reproduce as a curiosity and a guide to those who desire to know more of English products. He names:

"Hogg's Early Cold-Stream, Turner's Union Round (early rounds); Mona's Pride, Myatt's Prolific (early kidneys); Daintree's Seedling, Dalmahoy (round, second early Regents); River's Royal Ashleaf, or Veitch's Improved Ashleaf, *Almond's Yorkshire Hero (second early kidneys); *Gryffe Castle Seedling, *Rintoul's New White Don (round, class Regents); *Paterson's Victoria, *Dean's Excelsior (kidneys). The asterisks denote good keepers, and sorts which require to be planted three feet six inches apart row from row. Good colored sorts are Paterson's Scotch Blue (round, second early); *Paterson's Alexandra (kidney, late); and *Dean's Cottagers' Red. A potato fit to displace Hogg's Coldstream is a new sort, called Veitch's Early Perfection. Fenn's Onwards is also a second-early garden variety, of good quality. The much-vaunted American sorts are no longer grown by me. I cannot recommend them for table purposes. As great croppers or for very poor, sandy, light soil, they may be approved.

Japan Bean.—There has been a man in this vicinity selling a bean which he calls the "Pride of the Valley." It is a black bean, one and a-quarter inches long, and is very fragrant, the odor resembling new mown hay or sweet clover. The man is doing a good business, selling the beans at five cents each. He had a drawing, representing the bean when growing, and claimed that they came from Corea on the coast of Spain. Can you give us the name of this bean?—RICHARD BESSOM, JR., *Marblehead, Mass.*

OF course we cannot tell anything about this bean, without having a full description or a specimen. There is a man in your town who ought to "know beans," and we think he does; so please submit the question to J. J. H. GREGORY, the well known seedsman of Marblehead, Mass.

"Lost Nation" Wheat is highly spoken of by those who have grown it in Vermont, but we cannot inform P. F. C. where it can be obtained, nor what its specific and comparative merits are. Perhaps some of our readers can.

The Herdsman.

MILK FEVER IN COWS.

R. M. CLOSE, Sullivan, O., sends the following to the Ohio Farmer:—"I have lost by the disease, and after dissecting the dead animals, came to the conclusion that the stomach—first of all—must be immediately relieved or else the disease swiftly carries the cow entirely beyond help. The stomach is distended to the utmost, and fairly baked dry (*i. e.*, the contents are very dry). The womb or calf bag is also very much inflamed, but attention to this must be a secondary matter. Now in regard to the relief of the stomach, ordinary physic works so much slower than the disease that the animal dies before relief is obtained.

"Some two years ago I had a cow attacked with hoven. I tried several of the best known remedies with no good result. I did not understand tapping, as it is called, and my conclusion was that she was quite likely to die and an experiment would do no special damage, and knowing the relaxing and penetrating power of common coal oil, I gave her as a last chance one half-pint. The relief was instantaneous, and in twenty minutes the bloat was entirely removed. From that I concluded that the distressed stomach of a milk fevered cow would find relief from the same remedy. My first trial was a genuine case of the worst kind. At 9 o'clock P. M. my cow was feeding, she was at 5 A. M. of the next morning broadside and could not hold up her head. As quick as possible one third of a pint was poured down her; the gases of the stomach immediately passed off. I then crowded several small lumps of salt through the neck of the womb, which was very much contracted and inflamed, into the womb, her loins were then bathed in strong salt and water, and a blanket was thrown over her to sweat her. She lay with her eyes turned inward and groaning at nearly every breath.

"All that saw her said that she would surely die. But as the gases passed off, I knew she would survive long enough to let the coal oil work some time; her hind legs were quite stiff. She lay twenty-four hours from the time I first found her before she could with help stand on her feet, but she got entirely well. The dose of oil was repeated the third time within two hours. This remedy has been tried with success every time. I have been giving a rather minute treatment of this case because of its entire hopeless appearance at first sight."

NOTES FOR HERDSMEN.

Killing Lice on Cattle.—I will give a remedy that I think I have never seen published, which I know to be a sure thing. On a warm, pleasant day, take a pail full of warm water and put in as much carbolic acid as you think will do. It don't require a great deal. Saturate each animal thoroughly from the end of the nose to the end of the tail, and rub it in with a horse brush or anything that will do, until every inch of the animal is drenched to the skin; put the tail into the pail and soak it thoroughly, as there, and around the horns, you will usually find the most lice. Put each animal in the stable immediately, where they cannot lick themselves until dry. This will not need to be repeated unless the cattle are very lousy.—C. C. R., *Utica, N. Y.*

Finding the Live Weight of Cattle by Measurement.—In answer to a correspondent, the London Field says:—Take the length of the back from the junction of the cervical and dorsal processes to the tail, and the girth immediately behind the elbow, square the girth, and multiply the result by the length, and then by one of the following decimal multipliers:

	DECIMAL MULTIPLIERS.		
	Class 1.	Class 2.	Class 3.
Half fat	·23	·225	·22
Moderately fat	·24	·24	·23
Prime fat	·25	·25	·24
Very fat	·262	·26	·24
Extraordinarily fat	·275	·27	·25

The dimensions to be taken in feet and inches, the latter reduced to decimals; the result will give the dead weight in stones of fourteen pounds.

Buffaloes as Farm Stock.—It has been found, by those who have made the trial, that the buffalo, or bison, will fatten under conditions fatal to ordinary domestic stock, that it is worth more in hide and flesh than the ox, and can be trained to the performance of any kind of labor for which oxen are adapted. It is necessary, however, that calves should be obtained for this purpose, which is a most difficult task, since they are kept in the center of the droves and protected by the bulls, who fight desperately for their children. It is dangerous work to reach and take the calves.

Lousy Texas Cattle.—I have ninety odd head of Texas cattle, all lousy, and as wild as buffaloes, almost. I cannot handle them. What remedy shall I use in this case? All the remedies I have noticed in the RURAL NEW-YORKER relate to domesticated animals.—D. C. B., *Brookville, Kan.*

To Prevent Round Worms in the Intestines of Horses, a writer in London Field recommends top-dressing pastures in which horses, especially brood mares, are kept, with lime and salt, alternately. Thus it is claimed the parasites may be destroyed.

To Kill Lice on Calves and Sheep, give them turpentine with their salt.—R.

The Horseman.

NOTES FOR HORSEMEN.

Mare with a Cough.—I have a good mare that has had a cough for several months. She shows no heaves, only a dry cough. I feed her dry hay and wet her grain. Can you, or any of your readers, inform me what course to take in order to cure her cough?—H. A. STICKLE.

THE mare should not have dry feed of any sort. A cough may arise from various causes—from irritation of the larynx, worms, etc. If from the irritation of the larynx, apply mustard poultices a few times; if from worms in the intestines, (the symptoms of which are a rough, harsh, staring coat, irregular appetite, a disposition to rub the tail, breath hot and fetid, and a short, dry cough,) give three drachms of calomel and one drachm tartar emetic. Mix and divide into three powders and give one each successive night. Twenty-four hours after give a purgative ball consisting of 6 drachms Barbadoes aloes, 2 drachms pulverized ginger, and one drachm pulverized gentian root. But if the cough exists without any apparent connection with worms, or as a termination of a disease previously existing, give, every night, in a bran mash, one of these powders: of sulphate of copper (blue vitriol), digitalis (Foxglove), pulverized squills, nitre, camphor, each one ounce—all to be made into ten powders. Feed green food, such as carrots, potatoes, turnips or parsnips. We have known this to prove effective. It is one of JENNING'S prescriptions.

A Mare With Heaves.—JAMES I. VANAKEN writes us that he has got a mare which has just begun to show appearance of heaves. He asks if there is any cure. E. G. P., Toledo, O., in RURAL NEW-YORKER May 6, 1871, writes that such cases can generally be cured by a dose of physic, followed by bran mashes and clean, dusted timothy hay, or bright, clean straw. He has also relieved a favorite mare very much by feeding wild turnip and sumac bobs in mashes, and finally cured her perfectly with lime water and ginger. A barrel of lime water was placed in the barn, and one or two quarts were drawn into the pail every time she was watered—never allowing her to drink more than a half or two-thirds of a pail full at a time—of course watering her frequently. The ginger was given, a table spoonful at a time, twice a day in bran mash; feed, corn and bright wheat straw until a perfect cure was effected, afterward she was fed as one would feed any horse.

Remedy for "Knee Sprung" Horses.—G. C. WEEKS, Tiskilwa, Ill., writes the Western Rural that he has cured many "knee sprung" horses by having them shod with heel-calks very long and toe-calks short. Thus the constant strain of the cords of the leg is removed. The horse, thus shod, should have his legs bathed twice a day, for a few days, with salt and vinegar, and should not be driven nor ridden fast down hill.

Horse Pawing in Stable.—N. H. W., "a greatly annoyed subscriber," asks for a remedy for a horse pawing in the stable. The only remedy we ever saw used was heavy shackles, with a chain long enough to enable the animal to change position.

Inquiries for Correspondents to Answer.—DAVID A. CHATFIELD asks whether wolf-teeth in horses have any effect whatever upon the eyesight.——W. W. asks if there is anything better than wood ashes to destroy long, round worms in horses.

To Break a Balky Horse.—Do any of the readers of the RURAL NEW-YORKER know a sure and safe way to break a balky horse? If so will they not give it?—S.

Industrial Topics.

FARMER GARRULOUS TALKS.

How to Plow Deep.—The other night I heard that learned farmer, HORACE GREELEY, talking to a group of clod-hoppers, like myself, about deep plowing. We stood with our mouths open and our hands thrust deep into our pockets, absorbing his wisdom much as we inhale air, without stopping to think whether there is any "pison" in it or not. He is going in for steam plows now, strong, and as long as he lives, he says. He had seen them turning up the stiff clay and alluvium, below New Orleans, two feet deep; and that turned-up soil produces extraordinary crops the same season.

"Why, sir, I can take one of those steam plows right out on to the prairies—on new prairie, where they think land must not be broken more than three inches deep at first—and turn it up two feet, and grow good crops on it every time."

That is what Farmer GREELEY said. I mildly asked what time of year he would plow to get a good crop the first season.

"Any time," was his laconic reply.

I suggested that he couldn't get a good crop if he tickled and rolled over that virgin prairie soil two feet deep in the spring and seeded it.

But Farmer GREELEY said he could; and I replied that I had seen a little of that sort of spring plowing done on the virgin prairies, and the first crop rarely paid for harvesting—that the cold subsoil turned to the surface in spring, saturated with water, unaerated, sour, uncivilized, would not furnish a seed-bed in which seeds would germinate and plants grow successfully the first season. I had seen it done twelve inches deep on the Illinois river bottom lands, and on the banks of the Mississippi, and on the clays of Du Page and Cook counties, Ill., and even on the lighter lands found in some parts of Kenosha Co., Wis., but it would not do. If plowed deep any time from July to November, and allowed exposure to rain and frost during winter, it would produce very well the season following, and still better the second season. I seriously thought, though I did not say, that my fellow farmer GREELEY'S talk was not as wise as it ought to be. I did humbly suggest, however, that while I was an earnest advocate of deep plowing, I felt sure that the time and manner of plowing deep, as well as the kind of soil treated, had much to do with the immediate results to follow.

"But," said my friend, "how do you account for the increase of crops the first season, on lands plowed two feet deep, in Louisiana?"

"Easy enough," I replied, growing somewhat bolder; "those lands lie under a tropical sun, are of a more uniform temperature the year round, do not get filled with frost, nor sodden and soured with water; even if they do, the action of the sun upon them, when turned to the surface, is intense, and seed planted quickens under its influence as it will not in more temperate climates. There is no parallel in the conditions."

I was glad to hear that jolly farmer, QUINN, tell a little story, illustrating the impregnability of my position, at this point. He said a good Quaker farmer wrote to the late Prof. MAPES, one spring, asking his advice, for his son, as to how deep he should plow his 15-acre field for corn. Prof. MAPES replied, "as deep as you can get the plow in." In the fall the Professor received an indignant note from the Quaker, which began, "Thee ought to be burned; we followed thy directions and our crop is a failure." Prof. MAPES said, in reply, that his Quaker friend would apologize for his intemperate language within two years; and sure enough he did; for the second and third years the reward of deep plowing came, and the MAPES stock went up in the Quaker's family.

So you see, Mr. Editor, that if one can wait one season or two, turning over the soil deep in spring will pay; but suppose one cannot wait? Then turn a surface furrow three to six inches deep and follow with a subsoil plow in the same furrow, letting it run in as deep as the teams can draw it. Then all the good and none of the ill effects of deep turning will be realized the first season, for it is not always wise to invert the subsoil. Of course it depends upon the character and texture of the surface soil.

I ventured to say to my friend GREELEY, that a vast amount of disgust to farmers, and loss to the aggregate production of the country, had resulted from recommending deep plowing unqualifiedly and without accompanying such recommendation with suggestions as to the time, mode and manner in which it should be done at different seasons and in different soils—that a steam engine is a good thing; but that if a man does not know how to use it, it may result in the burning or blowing up of himself or his buildings, or both; and that I hoped that great Public Teachers, like himself, would be as discriminating in their agricultural as in their political teachings.

FARMER GARRULOUS.

The Apiarian.

ANSWERS TO INQUIRIES.

IN reading the RURAL NEW-YORKER I have noticed, under the head of Apiary, inquiries by different persons about the care of bees and their general management. Having had considerable experience in the management of bees, I feel prepared to answer some of the questions asked therein.

Building a Bee-House.—S. T. J., Auburn, Indiana, asks with regard to building a bee-house: what size to build for three or four swarms. My answer is, don't build any at all; they are a nuisance—a harbor for moths, a place for spiders. Any bee that happens to fall into their webs (which occupy every corner), is lost beyond redemption. For the common or box hive, I would make my stand for each hive by itself, elevated from the ground not more than three inches; do not crowd your hives together—the great cause of loss of young queens when they make their bridal tours. For shade try to get them in the range of some tree. In the spring, when the swarm is light, give it all the sunlight you can; it helps nature the brood; as the days get warmer, draw your swarm in a direct line into the shade of your tree; do not move to the right or left.

When to Extract Honey.—Mr. HEAD, Paris, N. Y., Nov. 25, 1871, says in answer to P. V. C., Lebanon, Pa., as to how long after honey is deposited in the comb by the bees, is it best to extract it, "I would let it be until capped over by the bees." He doubtless extracted his honey in the after part of the day, before, as Mr. H. claims, it has been refined by the drone. I claim that it is not necessary to wait until it is all capped over. Simply let it remain in the hive over night. The watery matter is evaporated by the bees themselves, and not by the drones, as Mr. H. claims. I had hives last season that did not rear a drone; still they perfected their honey as well as those bees that were allowed to rear drones. I cut out all drone comb from certain hives, for the purpose of experimenting; the result was a larger yield of honey, of just as good a quality. The drones that Mr. H. saw in his honey-box were young drones. The young workers will also ascend to the chamber of the hive. I used the Mel-Extractor the past season, to empty over 1,200 pounds of honey, in all stages, from the same hour that it was gathered, until it was capped over, and none soured.

B. C. F.

Brownhelm, O.

BEE NOTES AND QUERIES.

Winter Feed and Italian Bees.—In RURAL NEW-YORKER of Jan. 13th, I find an inquiry for the "best winter feed for bees." Take half pint of water to one pound "A" coffee sugar; boil not more than five minutes; cool and skim. It should be fed in October, with feeder set on frames. If this has been neglected, move the hive to a warm room, take out a comb, fill, and replace among the bees. If combs cannot be removed, boil until the sirup will crystallize when cooled off; then pour into a shallow pan; when cold cut into narrow strips; invert the hive and place the strips between the combs among the bees. I also notice the inquiry whether Italian bees are longer lived than common bees. Having kept Italian bees ten years, I find them a hardier and stronger bee than the native or black bee. Your correspondent can, in the following manner, determine whether they are longer lived: Take a hive of Italians and a hive of natives or black bees, of about equal strength in bees and brood, and exchange queens, and he will see which variety entirely supersedes the other first.—J. E. MOORE, *Rochester, Pa.*

Relative Value of Italian, Hybrid and Black Bees as Honey Producers.—Mrs. TUPPER finds that the Italians fill comb faster than the hybrids, and these faster than the common black bee. Considers the hybrid nearly equal to the Italian as honey gatherers, and sees no sufficient cause for having them pure bred when to be used as workers only.

Farm Economy.

COOKING FOOD FOR STOCK.

NOTICING in the RURAL NEW-YORKER a lengthy article upon the cooking of food for stock, in answer to an inquiry from a dairyman, whether it will pay, I take the liberty of giving my views and experience upon the subject. I find many valuable suggestions in your article, and am fully satisfied that circumstances alone can determine the practicability of its use. Location, which fixes the value of food to be fed, is of the most importance in arriving at a conclusion; next, the quantity of stock to be fed. A farmer living in a district remote from market, where fodder is only worth fifty per cent. of the values near market, and feeding less than forty head, in my judgment will find it will not pay to make the necessary outlay. But in case a like or larger amount are fed, near market, where fodder is comparatively high, there is no better investment.

As to my own experience, I am cooking feed. This is the second winter. I have a careful, observing farmer; in his judgment we saved forty per cent. of food last winter, and the stock wintered in much better condition than the old way. This winter, with improved quarters for them, the result is more satisfactory; their condition improved from the day they were put up, and no objections appear, as your English authority suggests. The process is, perhaps, more satisfactory to dairymen than any other; for cows will, with this process of feeding, give nearly twice the amount of milk they will from dry food.

Now as to the economy. If you will visit the farmer who feeds dry or natural food, you will find, first, that in the fall he spreads out in his yard his crop of cornstalks; his stock will eat the leaves and tips, if well cured; but the stalk, containing 75 per cent. of the nutriment, is left to be trampled in the mud or snow, and lost; for if you depend upon results from manure, before it has decomposed for such use, 75 per cent. of the manure is washed away or passed off in evaporation. So put it down as 75 per cent. of corn fodder lost.

Next comes the imperfectly made straw stacks, back of the barn. Set up as a target, it becomes the objective point of the hungry herd. This is to furnish shelter as well as food, and its sides are soon made into holes for shelter from the storms. Next come the winds, and the tall stack topples over, and it becomes trodden under foot, and again we have 50 to 75 per cent. loss. Hay, in many cases, receives like treatment. But in most cases it is husbanded and fed in barns.

Now, the cooking process saves all this loss. You cannot find in my yards a pound of straw or corn fodder; all is cut by steam power, mixed with water and shorts, and cooked by steam, and every ounce eaten up by the stock, and the manure always ready, for use, cared for.

I can safely say I am saving fully 40 per cent. of food, and my stock is in much finer condition than by the old way. During the extreme cold weather, early in the month, our water pipes, conveying water to the boiler, froze up, and the cooking process was stopped about two weeks. Our stock became mourners, and hung their heads when dry food was offered them, and positively lost, with our best efforts to prevent, 10 per cent. in condition, while eating 40 per cent. more fodder. This statement may appear questionable to many of your readers; but I only ask a trial, as evidence of its truth. And while I do not wish to influence any one into its use by my own experience or views, I can but be an advocate of its utility where circumstances demand economy; and I would advise, to all inquiring minds, a personal investigation, if possible.

At some future time, when opportunity offers, I will be glad to lay before your readers a plan of my buildings, machinery, and process of preparing food for stock. This being my first, and a hasty effort in recommending improvements to your readers, I will write no more at present.

H. W. H.

Syracuse, N. Y.

A PROPOSED EXPERIMENT.

THERE has been no saying oftener repeated, and none more worthy of repetition, so far as Farm Economy is concerned, than "A place for everything, and everything in its place." One of the best modes for every farmer to apply this rule in practice, is to make a complete list of his farm implements from his wagons, carts and plows, down to awls, gimlets and screw-drivers; let every implement be immediately returned to its place after using, no matter how inconvenient this may be, instead of throwing it on the ground till forgotten, with the intention of replacing it when a suitable moment occurs to do so. Now, if any one is unprepared to do so, we would recommend the following experiments, in order to test its merits by figures:—Let him keep an accurate record of all the time lost in one year by hunting for lost tools in times of emergency, adding in the losses occasioned by keeping other persons or teams in waiting while the search is in progress; also, adding the waste occasioned by exposure of such tools to the weather, or by finally losing them, not forgetting to estimate the detriment to his crops and farming operations generally by the delays thus frequently occasioned. He may, likewise, if he chooses, keep an account current of the amount of vexation caused by these annoyances, unless he is so far gone that disorder and delay are matters of indifference to him. We have no doubt that such an experiment as this, faithfully followed out, would greatly surprise him at the end of the year, and furnish satisfactory proof of the immense superiority of the plan first proposed by us. Who will be willing to give both ways a full trial?

M. Y.

Rensselaerville, N. Y.

ECONOMICAL NOTES.

Effect of Ground Bone upon Lands.—UPHAM, SHAW & Co., in their circular with reference to the action and value of the Brighton Bone Phosphate, say:—"To be of any value whatever, ground bone must be placed where it will undergo decomposition. It will not rot under the influence of heat alone. Both heat and moisture are required. Its efficiency is greater or less in proportion to the greater or less rapidity with which it decomposes. Placed in a dry soil, in a dry season, its effects will scarcely be perceptible; whereas, in a moist soil, having sufficient warmth, its influence upon any crop will be strongly marked. For intermixture with sour soils, no other material is superior. It neutralizes the acids, and warms and decomposes all the vegetable matter. The only way we shall recommend for using the Brighton phosphate upon dry, sandy fields, is the application of it with muck and barnyard manure, or in a compost of these articles. These manures will hold water in the soil, and hasten the decay of the bone. In the vicinity of Hatfield the most gratifying results were obtained from sandy fields by this process. To be fit for use in the spring, muck should be hauled out to freeze now."

Gas Lime and Wire-Worms.—A correspondent of the London Field says?—"I have had some experience on three-quarters of an acre of garden ground made from old turf land, and I feel sure the remedy which I adopted will answer the end on my land. The first and second years I was dreadfully pested with wire-worm; my potatoes, turnips, carrots, and other roots were pierced through and through with this pest. A thought struck me that the application of spent gas lime would settle my enemies; so I sent for two cartloads from the Deuby Gas Works, and I had it mixed with six times as much good soil and manure, equal quantities; the manure was chiefly sawdust upon which pigs had run. This was spread on the ground in November, and dug in a spade deep; then in the spring I put early and other potatoes and the general crop, with some light stable manure. I had excellent crops that year and afterwards, but not a single wire-worm could I detect after that dressing. It is very important not to overdose with the gas lime; dilute it well with soil and manure, and it will destroy grubs as well."

Sowing Clover Seed.—Farmers who grow clover seed are recommended, by a writer in the Rural World, to sow the seeds in the chaff without hulling, since it is actually worth more and will bring a better crop than the same quantity of seed will if hulled. He says many of the seeds are injured by hulling, and the chaff is a protection to the young and tender plants.

Clearing Land.—I saw an inquiry in the RURAL NEW-YORKER with regard to clearing land. Get an ax, grub-hoe, cross-cut saw, beetle and iron wedge, then go to work. You will get posted in the theory of improving a farm, and never ask as simple a question again.—SUBSCRIBER, *Eaton, Mich.*

Corn Cob Meal.—A writer in a rural paper says of the value of cob meal for stock, that he would as soon have ashes as the meal.

The Gardener.

MUSHROOMS FOR THE MILLION.

Too few know how to produce this luxury cheaply. D. T. FISH says:—"In any place—back shed, floor of hot-house, cellar, stable, garret—where a temperature of 50° or 56° can be maintained, mushrooms may be grown. We have heard of a Belgian cook who grew them in his old shoes, and assuredly they can be grown very well in four or six-inch pots, pans, boxes, or even in a cracked tea-pot. The accompanying is an illustration of how they can be grown in the tops and bottoms of old casks. A barrel is sawn crossways into two pieces, each forming a tub. Holes are made in the bottoms of each, and a thin layer of good soil is spread over them inside. They are then filled with good, well-prepared stable manure, just like that used in ordinary mushroom beds, the different layers of manure in each tub being well pressed down. When the tub is half filled, six or seven good pieces of spawn are placed on the surface, and the remainder is filled up with manure, which is well pressed down, the operation being completed by giving to the heap the form of a dome. The tubs thus prepared, are placed in a perfectly dark part of a cellar, and eight or ten days afterwards the manure is taken off until the spawn is visible, in order to see whether it has commenced to vegetate and develop little filaments. If the spawn has spread, the surface must be covered with soil, care being taken to use only that which is fresh and properly prepared. In this or any similar way, there should be no difficulty in growing mushrooms; the boxes or tubs could be filled anywhere, and then carried into spare cellars, etc. In this manner, objections against steaming manure might, in many cases, be got over.

"There is one immense advantage in growing mushrooms in portable and small pots, boxes, tubs or cask bottoms. When the manure gets cooled down, and the crop gets checked for lack of warmth, these portable contrivances, with their freight of young mushrooms, may be plunged bodily into warmer media, such as a sweet bed of fermenting manure. Crops can likewise be safely hastened or retarded by ranges of temperature from 65° to 45°. Thus they may be brought forth from the cellars and placed in forcing-houses at work, or plant stoves, in cases of emergency. Even the cook might grow his own mushrooms in pots on his kitchen shelves or under his table, and when they come in with too great a rush, remove them to the cold meat larder, to take a quiet nap till wanted. By plunging the pots or pans in a genial medium, I have found that the fermenting material inside the pots may be almost dispensed with. The spawn runs best in a little sweet horse manure, that is, manure that has had its grossness sweated out of it by ten days' or a fortnight's gentle fermentation, and four or six turnings upside down and inside out. Place a handful of this in a pot or pan, with one or more pieces of spawn, according to the size of the pot; fill with soil, and plunge in a bottom heat of, say 55° or 60°, and in five or six weeks a crop of mushrooms will be gathered. Should the heat fail, renew it with fresh manure and replunge. By this method, a uniform temperature may be provided for the mushrooms through the whole period of growth.

"Finally, I never could discover any difference between mushrooms grown in the dark and those grown in the light, and therefor the latter is by no means essential. Indeed, dry, warm cellars are among the best situations for mushrooms. Good spawn is the one thing essential."

CHICORY CULTURE.

I SHOULD like to learn something of the cultivation of chicory. Can it be cultivated successfully in this climate (Niagara Falls)? Will you or some one of your many readers give me the necessary information as to the mode of producing it.—P. S. WRIGHT.

THE common chicory, having been introduced into our gardens many years ago, has now spread over the country, and can be found growing wild as a troublesome weed. There are many varieties, some of which are extensively grown for salads, the young leaves being blanched either by tying together or covered with boxes. The root is also used for the adulteration of coffee, and if you wish to grow it for this purpose get the Large or Turnip-rooted chicory, and sow the seeds early in spring, previously preparing the soil by ploughing deep and making it rich. As the success of the crop depends upon the size of the roots, a thorough and deep pulverization of the soil is one of the first and most important requisites. Sow the seeds in drills, far enough apart to admit of working between with a hoe or hand cultivator. When the plants are a few inches high, thin out to about five or six inches apart in the row. Cultivate thoroughly through the summer, and in fall dig the roots, wash and clean them, then cut into small pieces and dry in a kiln, after which they are ready for market. Large quantities of dried chicory are annually imported; but we know nothing of the profits derived from its culture.

GARDENERS' NOTES.

Preparing Land for Strawberries.—In your valuable paper, March 2, A. W.

A PAIR OF GRAY DORKINGS.

WOODCOCK inquires about manure, etc., for strawberries. In spring I prepare the ground for a crop of early potatoes, manuring it so as to grow that crop well. Work the potatoes well, keeping them clear of weeds. When the crop comes off I give a light coating of manure, plow the ground deep, pick off weeds, etc., harrow and level it well. I then line out the rows three feet apart, go to the nursery bed with a flat box or basket, lift the plants with ball of earth, and carry them to the ground prepared for planting. A boy goes before with a garden trowel, digs the holes about four inches deep, sixteen inches apart in the row, immediately before the planter; he fills each hole with water; the planter drops in the plant and covers the root with dry earth, pressing lightly. By so doing, no matter how hot and dry the weather may be, I never fail to have a full crop the next season; and that is as much as you can have by spring planting. I prefer potatoes as a crop, as the ground is thereby well cleaned. I generally plant all through the month of August. I plant, on an average, 3,000 plants every season. It is very tedious, but it will pay. If I had not plants of my own, I would purchase a few hundred in the spring, manure the ground and work them well, picking off the fruit stems before they bloom. They will have made good plants by August. In this section I find the best kinds are, 1st, Wilson's Albany; 2d, Green Prolific; 2d, Agriculturist. I have tried many others, but fall back on these. The above remarks apply more especially to growing for market.—JAS. McI., *Newcastle, Pa.*

Soluble Sulphur and the Red Spider.—R. VARDEN writes The Garden:—"I use this in spring in large quantities for the destruction of red spider on gooseberry and currant bushes, and prepare it as follows:—I slake some quicklime, and mix it with about half its weight of common flour of sulphur in a heap, with a little water, as in making mortar. After lying a few hours, I boil it for twenty minutes in a large boiler of water, in about the proportion of one gallon to one pound of the mixture. This produces a sulphurous liquid, about the color of porter, two or three pints of which to a two-gallon bucket of water is strong enough for syringing; but we test the strength, by dipping a spray into the bucket, and get the liquor just strong enough not to damage the leaf. If too strong, the leaf withers in an hour or two.

Trophy Tomato.—H. T. SAVAGE is much pleased with the Trophy. Seed planted late last spring, the plants receiving quite indifferent care, produced vines full of large and perfect fruit, ripening as early as any kind he ever grew, and of superior flavor.

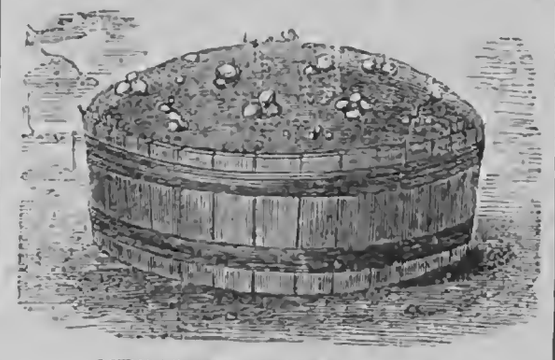
The Poultry-Yard.

POULTRY NOTES AND QUERIES.

Diseased Fowls.—Some two months ago a disease attacked one of my chickens, which is entirely new to me. The right side of its head swelled up, closing and appearing very much inflamed. In a few days a whitish circle appeared on the outer edge of the part affected; on examining it, I found that the flesh had become like a mass of cheese; indeed, a piece of strong Limburger would smell sweet beside it. I saw no hopes for that chicken, so took its head off. A few days after, another was attacked in the same way. I immediately burned it out with caustic. This I continued for a week and turned it loose, apparently well. In less than a week it was worse than ever, and, on cutting it, I found that the flesh was completely rotted off the bone. Seeing no hope of curing it, I killed it and buried it so deep that nothing will ever touch it. Since then I had another affected the same way which I killed at once. I have several works on poultry, have been a reader of the RURAL NEW-YORKER for some years, but have never heard of anything like it. The cholera killed more than half the fowls in the country last year. If this new disease is going to attack what is left, I would like a remedy for it.—A SUBSCRIBER, *San Antonia, Tex.*

LET any of our readers, who can, give information that will help our correspondent.

Brandon, Vt., Farmers' and Mechanics' Club Turkeys.—A correspondent informs us that a session of this Club was devoted to weighing turkeys produced by the members—turkeys being regarded about as profitable a crop as a farmer can raise. Messrs. SPRAGUE and MERRITT presented: 1 yearling gobbler, weight, 37 lbs.; 1 yearling hen, weight, 19¾ lbs.; 1 chicken gobbler, 9 months old, weight, 28¼ lbs.; 1 wild hen, 12 years old, weight, 19¾ lbs. The



MINIATURE MUSHROOM BED.

Committee is reported as of the opinion that ten days extra feeding of the pair of yearlings would cause them to welgh sixty pounds. These turkeys are a cross between the Bronze and wild turkey.

Houdans as Layers.—P. H., Lynn, Mass., must have bought his Houdan eggs in a poor market. This way, we find the Houdans to be fine layers, and strong, healthy fowls. I purchased some eggs from a man who imported his stock from COOPER. They were hatched Aug. 6th, 1870, and commenced laying Jan. 15th, 1871. The chicks at four weeks old were as far advanced as my Light Brahmas at eight weeks; never had a sick chicken. One Brahma hen had the care of 23 chicks. They are non-setters in every sense of the word, and not so good for the table as the Light Brahmas.—R. H. H., *Farmouth Port, Mass.*

Brahma Fowls.—"A Farmer's Wife," Indiana, writes:—"We have kept and bred Brahmas and Shanghais, and will give them credit for being good winter layers and good summer setters. Ours would lay fifteen or twenty eggs and then sit on a stone, if we would let them."

S. H., Johnstown, N. Y., writes:"—I have bred pure Brahmas for two or three years, and am perfectly satisfied with them as summer layers, thinking they will outlay any of the common breeds. As winter layers they can't be excelled. My Light Brahmas have been laying all this winter, and still continue to do so. I should advise persons to keep nothing but Light Brahmas for all general purposes."

Gray Dorkings.—"New Reader" asks if Gray Dorkings should have feathered legs. No; they should be straight, short, stout, clean, perfectly free from feathers, spurred on the inside, white, with a flesh-colored tinge between the scales. We give, as he requests, a portrait of a pair of Gray Dorkings. The points of all classes of fowls are given in detail in the People's Practical Poultry Book.

Chickens Weak in the Legs.—W. T. TRESCOTT'S chickens appear to lose all use of their legs—especially the knee joint. In other respects they are well, and have good appetites. They do not act as fowls do that have the vertigo, and he asks some experienced poulterer to tell him what is the cause, and cure for them.

Cheap Artificial Mother.—I would like to know how to construct a cheap Artificial Mother for young chickens.—J. J. BISHOP.

OUR correspondent will find in the People's Practical Poultry Book, published at this office, descriptions of artificial mothers.

Spanish Cocks' Combs.—A writer in the Cottage Gardener says:—"A shrivelled comb on a Spanish cock is indicative of internal disease, and is a symptom of 'black rot,' to which this breed is subject, and from which they never recover."

Breeding Pure.—A correspondent asks: "Will a trio of full-blooded fowls breed pure if kept in company with other hens?"

We know no reason why they should not.

Rural Architecture.

HOW TO BUILD AN ICE-HOUSE.

To build an ice-house ten feet square inside, take four planks, two inches thick, twelve inches wide, and twelve feet long; nail the one on the other at the corners, at right-angles; block them up two inches from the ground on a level spot; no digging is necessary. These planks form the foundation. Stand and plumb a scantling, two by four inches, at each corner, ten feet long; then stand inch boards, ten inches wide and ten feet long, face to face, three or four feet apart, perpendicular; board horizontally inside and out; fill in the vacant space with tanbark, sawdust, or chaff, the chaff being well packed in the hollow wall; eight feet six inches from the foundation will be sufficient packing; make three holes, three inches square, under the eaves on each side; this will afford sufficient ventilation. Do not select a shady place for the house, as the ice keeps better in an open space. The gable ends and roof require to be single, and must not be packed. Ice must have air to preserve it; it is as essential as air for a man.

Place the door in either the north, south or east end; pack the wall under the door step eighteen inches high from the ground; make the door three feet wide, six feet six inches high. One door will answer; lay six inches deep of leached hemlock tanbark on the ground inside, to lay the ice on. No drain is required. Fourteen hundred feet of common lumber will be enough to build an ice-house twelve by twelve feet, outside measurement, ready for the shingles.

To pack the ice, cut it as straight as possible, and pack close together; lay six inches of clean pine sawdust on the top of the ice to protect it. When the sawdust falls down around the sides, put in a few baskets full as the ice requires it, and you will have no trouble in saving ice. Build the ice-house as close as possible to the dwelling-house.—JAMES MCKELVEY, *St. Catharines, Ont.*

THE foregoing article did not reach us until March 20th; but it is not too late for readers in some localities to utilize it this season.

Diary of a Ruralist.

DAILY RURAL LIFE.

FROM THE DIARY OF A GENTLEMAN NEAR NEW YORK CITY.

Cutting Timber.—*March* 1.—I have been trying to find out, for the past twenty years, in which one of the twelve months it is best to cut timber, in order to have it remain sound and free from the attacks of insects. Of course I have read all the moon theories, and similar nonsensical stuff, handed down from superstitious granddaddies, but facts to prove any of the many assertions made, are extremely scarce. It is true, if we cut down hickory trees in winter, the wood is in proper condition by spring to be attacked by all the wood-boring beetles that appear at this season, and prefer felled hickory trees to those which are standing. If we wait until the sap is flowing rapidly in spring and then cut the trees, thousands of the little *Scolytidæ* are attracted by the sweet juices of the wood, and seldom fail to leave millions of eggs which soon become either wood or bark-boring beetles. I do not know of any tree that is exempt from their attacks.

Late in summer seems to be nearest the best time to escape insects; but then there is a large amount of half matured sap-wood which decays rapidly. It is certainly quite provoking not to be able to save a little good timber for farm implements, without having to fight rot and insects; but, as this has to be done, it is better to go at it systematically and not haphazzard. Most of the insects which attack trees or timber deposit their eggs in the crevices or just under the bark. Consequently, the best preventive against their attacks is to remove the bark of trees as soon as they are cut down. But to do this easily, the trees must be cut in spring when the sap is flowing most rapidly. After the timber is peeled off it should be left entirely exposed to the sun and air, where the surface will dry rapidly.

Timber that is to be preserved for use about the farm, for such purposes as harrows, handles of implements, etc., should be peeled and divided into required sizes, and then stored in a dark, dry place. Even with all this precaution, I have known it to be injured by borers; but an application of coal oil is not only a preventive, but sure death to any insect that may come near.

Milkweed Fiber.—*March* 12.—How many times I have received pods of the common milkweed, containing fiber, from correspondents, who asked if this substance was not valuable. It would be difficult for me to tell. Many an imaginary fortune has been made out of this supposed-to-be new substitute for cotton; but, alas! I fear that all the species of *Asclepias*, including the celebrated Cundurango, which, I believe, belongs to the same genus or family, will never clothe the naked or heal the sick. It is a pity, however, that a plant which should have received its name from the God of Medicine, ÆSCULAPIUS, and known in the earlier ages as *Vincetoxicum*—Tame-poison or Master-poison—should have become so unpopular in these later days. Perhaps the man who sent the Cundurango to the Experimental Gardens at Washington, is like CHAUCER'S Doctor, whom the old poet thus celebrates in verse:

"With us ther was a Doctour of Phisike;
In all this world ne was ther non him like,
To speke of phisike and of surgerie;
* * * * * * *
He knew the cure of every maladie,
Were it of cold, or hote, or moist or drie;
And where engendered, and of what humour:
He was a verray parfite practisour."

If there is any part of the milkweed plant more valuable than another, it is the bark, which contains quite a large amount of strong, fibrous material, and might be utilized; still there are so many other plants of like nature, but better, that the milkweed must necessarily remain neglected for some time to come.

Winter-Killed Plants.—*March* 13.—The past winter has been the severest upon plants of any that I have ever known. In looking about my garden to-day, I have been considerably surprised to see so many of what we have always considered hardy plants injured or killed to the ground. More than one-half of the hardiest varieties of raspberries are cut down; even the old Kirtland had to succumb to the extremely dry and cold winter. Unprotected strawberry plants show very little signs of life, and from present appearances small fruits of nearly all kinds will not be over abundant in this region of country. The snow has been so scarce that I have been to the railroad station but once on runners this winter. Now, it is a question whether a man had not better live a little further North or further South, so that he can make some kind of calculation on the weather; for it is doubtful if the fruits three hundred miles further North will suffer as much from cold as here. There are advantages and disadvantages in all localities, and the best way is to look at the bright side and stick to our base of operations.

Floricultural.

FLORICULTURAL NOTES.

Rose Rendatler Pelargonium is highly spoken of for winter flowering, its bright pink flowers growing brighter and in better shape than in summer, and are also produced very abundantly. A gardener who now has a house half full of it, which has been a mass of flowers for three months, says:—The cuttings were struck late in spring, and grown in the open air, in six and eight-inch pots; not plunged, but placed on bricks, and in September were removed to a light, airy house, where the temperature is not allowed to fall below 40°. The plants are now many of them perfect little specimens, fit for a dinner table, with five or six fully developed trusses on each. I have given many other kinds a trial for winter flowering, but never found another half so good as Rose Rendatler. This I have grown and watched five or six winters, and it has never failed.

Cool Orchids for Conservatories.—The Editor of The Garden, in answer to a request to "name a few cool orchids for a conservatory—these easiest to grow and obtain," says:—"Orchids in general require a little extra heat when making their growth, but we think the following may suit you: *Barkeria Skinneri, Cattleya citrina, Cypripedium insigne, Cœlogyne cristata, C. odoratissima, Disa grandiflora, Epidendrum vitellinum, Goodyera macrantha, Lælia anceps, Lycaste Skinneri, Masdevallia ignea, Miltonia spectabilis, Odontoglossum grande, Phajus grandifolius, P. Wallichii.*"

Chinese Primroses.—In RURAL NEW-YORKER of Jan. 6th, "Daily Rural Life" recommends double Chinese Primroses to ladies for house culture; says they are propagated by cuttings. I would like to ask if they can be obtained from seed; and if they can, under what name, and where procured?—MRS. L. M. C. PARMELEE.

THE double "Chinese Primroses" do not produce seed, therefore none is to be had. The plants can be purchased of any New York City florist, and, we presume, elsewhere.

"DOLLY VARDEN" WALKING SUIT.—[See Page 215.]

Brackets for Flower Pots.—Will W. H. W. (see RURAL NEW-YORKER, Nov. 18, 1871) describe, more fully, how a bracket of steel springs can be made strong enough to support a flower pot? Also give us patterns, &c. We should like more hints similar to those in the article referred to.—A SUBSCRIBER.

"Solomon's Seal" is highly recommended by English gardeners, for forcing in masses for the conservatory. It does best in not less than ten to twelve inch pots, grows about two feet high, and, as it has large, fleshy roots, care must be taken not to break or bruise them in potting.

Camellia and Lime.—NOTTS says the Camellia will not grow in soil from a limestone formation, while it will thrive like a willow in tough, fibrous loam from a sandstone formation. What is the experience of our readers in this respect?

Industrial Societies.

INDUSTRIAL SOCIETIES.

The St. Louis Ag. and Mech. Ass'n holds its next annual Fair Oct. 3-12, 1872.

The Northwestern Poultry Association has elected the following officers for 1872: *Pres.*—L. L. GREENLEAF. *Cor. Sec.*—W. T. Shepard. *Rec. Sec.*—M. R. Bartroo. *Treas.*—C. H. Atkins.

Laoni, Ill., Farmers' Club.—Officers elect for 1872: *Pres.*—A. M. BROWNING. *Vice-Pres.*—Jas. Short. *Rec. Sec.*—A. E. A. Meacham. *Cor. Sec.*—Isaac Colburn. *Treas.*—Henry Kinney.

Kenosha, Wis., Hort. Soc.—Officers elect: *Pres.*—STEPHEN GALT. *Vice-Pres.*—L. Woodworth. *Sec.*—J. B. Ilsley. *Treas.*—F. H. Lyman. *Ex. Com.*—Wm. Gordon, Peter Hutchinson.

The Mass. Society for the Promotion of Agriculture proposes to hold in Boston, in September, a grand exhibition of thorough-bred stock and dairy products; $14,000 is to be offered in prizes.

Iowa Fairs are announced as follows:—North Eastern Iowa Ag. Soc., Sept. 24-27; Mahaska Co. Ag. Soc., Aug. 27-30; Poweshiek Co. Ag. Soc., at Brooklyn, Sept. 13-15; Monroe Co. Ag. Soc., at Albia, Sept. 10-12.

Brandon, Vt., Farmers' and Mechanics' Club.—Officers elect for 1872: *Pres.*—DR. C. L. CASE. *Vice-Pres.*—E. June. *Treas.*—C. M. Whislow. *Sec.*—C. D. Pitts. *Cor. Sec.*—J. F. McCollum *Aud.*—A. S. Cook. *Lib.*—S. B. June.

Moultree Co., Ill., Ag. Soc.—Officers elect for 1872: *Pres.*—J. E. EDEN. *Vice-Pres.*—Elihu Welbon.—*Sec.* and *Treas.*—G. W. Vaughn. *Directors*—E. A. Mills, J. H. Snyder, J. B. Taylor, George Hethrington, F. H. Crowder. Fair, Sept. 25—28.

Hancock Co., Ill., Grape Growers' Society.—Such a society was recently organized at Nauvoo, Ill. Officers elect: *Pres.*—G. B. WOLCOTTER, Warsaw. *Vice-Pres.*—A. Beger, Nauvoo. *Rec. Sec.*—C. C. Hopper, Warsaw. *Cor. Sec.*—E. Baxter, Nauvoo. *Treas.*—C. Bradley, Nauvoo.

Indiana Bee-Keepers' Ass'n.—Officers elect: *Pres't*—J. F. WRIGHT, Columbus. *Vice-Pres'ts*—G. Bohrer, Madison Co.; E. G. Holliday and W. A. Schofield, Indianapolis. *Sec'y*—A. J. Pope, Indianapolis. *Treas.*—S. J. McNabb, Indianapolis. The fall meeting of the Society is to be held during the State Fair at Indianapolis.

The Buffalo, N. Y., Driving Park Ass'n has decided to offer premiums to the amount of $60,000, to be won at the August meeting. The premium programme is as follows:—Three minute horses, $1,500; 2:30, $2,00; 2:40, $4,000; 2:34, $5,000; 2:30, $10,000; 2:27, $10,000; 2:25, $10,000; 2:21, $5,000; for all horses, $10,000; four-year olds, $1,000; five-year olds, $1,500.

Cape May Co., N. J., Ag. Soc.—Officers elect: *Pres.*—WM. DOOLITTLE. *Vice-Pres.*—Francis Williams. *Sec.*—T. E. Van Gilder. *Treas.*—David Townsend. *Ass't. Sec.*—F. S. Townsend. *Ex. Com.*—Thaddeus Van Gilder, T. R. Gandy, Amos Wheaton, R. M. Townsend, David Warwick, Alfred D. Smith, Wm. T. Bates, Joseph Cresse, W. V. L. Siegman, Joseph Hall. Fair is to be held at South Seaville, Sept. 10th, 11th and 12th.

Portage Co., O., Ag. Soc.—Officers elect for 1872: *Pres't*—E. P. BRAINARD. *Vice-Pres't*—R. H. Peck. *Treas.*—E. B. Wait. *Sec'y*—John Moberg. Fair Sept. 25-27. The Board has wisely

Resolved, That no shows, swings, or similar exhibitions of any kind will be permitted on the grounds during our coming Fair; neither shall any person be permitted to sell any goods at public outcry on the grounds.

Resolved, That no Horse Fair be permitted on the grounds of the Society.

The Woolen Manufacturers' Association of the West and South recently met in Chicago, and elected the following officers: *Pres.*—GEO. S. BOWEN. *Vice-Pres'ts*—H. S. Dickerman, Springfield, Ill.; L. S. Blake, Racine, Wis.; H. R. Gardner, Jonesville, Mich.; Geo. A. Crawford, Kan.; J. G. Gross, Tiffin, O.; H. E. Sterne, Peru, Ind.; Paris Gibson, Minneapolis, Minn.; Jos. Shields, Davenport; J. W. Stine, Louisville; R. S. Ross, St. Charles, Mo.; J. W. Fry, San Francisco; N. J. Bussey, Columbus, Ga.; J. Winterbottom, Denver, Col.; James W. Cummings, Salt Lake City. *Executive Com.*—R. H. Gardner, Mich.; F. K. Nichols, Ill.; Thomas J. Hargrave, Ky.; J. J. Meek, Iowa; R. Street, Wis.; E. Groendyke, Ind.; Charles Rabbits, Ohio; Thomas Stebs, Ohio; J. P. Goodale, Ill.; E. H. Aiken, Ill.; R. H. Chilton, Ga.; S. S. Patter, Ky.; Alton Pope, Ohio; John Schreimer, Ohio; J. V. Horton, Ind. *Rec. Sec.*—Aug. C. Schooley, Chicago. *Treas.*—J. G. Stolp, Aurora, Ill. *Cor. Sec.*—Dan'l Hill, Chicago. It was decided to hold the annual exhibition in Chicago, August 6—9.

Hygienic Information.

HYGIENIC NOTES AND QUERIES.

Remedy for Ringworms.—J. SMITH says "Gunpowder, made soft, (with what?) and applied occasionally, has cured ringworms."

"A NEW SUBSCRIBER," Woonsocket, R. I., writes:—"As soon as the ground thaws, dig a Narrow Dock root, wash off the dirt, bruise the end of it, and rub the juice on the ringworm, wherever it is, three or four times a day. It will cure the worst case that ever existed."

ANOTHER correspondent writes:—"Take a half teaspoonful of saleratus, dissolve it in as little water as possible, and bathe the parts with the solution as often, through the day, as convenient."

To Cure Nervous, or Sick Headache.—Several years since I was very much afflicted with nervous headache. Some one told me it was occasioned by drinking green tea, it acting as poison to some constitutions. After that I drank black tea, and have never been troubled with such headaches since. Other causes may produce nervous headaches, of course, but I believe this is one.—A FORMER SUFFERER.

Scientific and Useful.

A FARMER'S FURNACE.

THE description of furnace given by N. O. B., in RURAL NEW-YORKER, Jan. 13, is partially, but not entirely, original to people in this section. We have about the same sized stove as N. O. B. It is bricked up on either side by simply laying two courses, two inches from the stove, and about fifteen inches higher than the stove. Each course is a brick and a-half in width, and the brick an inch and a-half apart, for cold air to pass through. The back side is one course, laid close and against the stove, of the same hight as the sides. No mortar or mason required. The whole is covered with tin, oval on top, two inches on the three sides, from the brick, and raised from the bottom of cellar four inches, for the cold air to pass under. The hot air pipes pass from the top of this to any point desired. The smoke pipe passes to the front of stove and back, and then to the chimney, through the lower and upper hall. The lower hall, 11 by 27 feet, is warmed enough to sit in, and two large sleeping rooms above, each 14 by 19 feet, and one small one, 10 by 13 feet, are made warm enough to sleep in.

The size of the lower rooms, which can be heated sufficiently at all times, is, dining-room, 13 by 18; bed-room, 9 by 16; front and back parlors, each, 13 by 21. We used between 700 and 800 brick, (old ones.) The cost of hot air pipes, thr over the stove, and stove, was $35. The expense of smoke pipe and registers, are as to quality.

RURAL READER.

Denmark, Lewis Co., N. Y.

USEFUL AND SCIENTIFIC NOTES.

Raising Water for Irrigation.—A correspondent of the RURAL NEW-YORKER sends us the following, to which we shall be glad to receive and publish answers from such as have experience bearing upon the subject:—"We have a stream of water running through our place, and I would like to know whether we can raise enough of it with a water ram so that it will be profitable for irrigation, under the following circumstances: We can get a fall of from six to eight feet, and want to raise the water say from eighteen to twenty feet. If we can get it that height we can water some twelve or fourteen acres of a rather gravelly soil. What proportion of the stream can we raise? What do the "rams" cost? Will it work if the "feed pipe" is crooked? Which way could the same quantity of water be raised the cheapest—by a ram or a windmill? What would a windmill cost, large enough to raise a two inch stream to the above hight?—FARMER.

Steaming Food.—I intend to steam the food for my stock next winter, by means of a set kettle and a tight box, forcing the boiling water upon the feed, and covering the box tight. Would a Prindle's steam boiler be more profitable, my stock consisting of fifteen head of cattle? The place where I want to set my kettle being adjoining the barn-yard, could I fix my chimney so that my straw stack would not be endangered by the sparks?—OLD CONTRIBUTOR.

WE should think a Prindle's, or some other of the excellent steam boilers now made, preferable to the proposed arrangement. These boilers can be set and the steam generated at any required distance from combustible substances, and the steam conveyed to the food to be cooked in rubber tubes safely and effectively. We should not want a heap of straw near any chimney that we have seen made for such purpose.

Cheap Cement of Brick Dust.—Mr. F. B. MILES informs the Journal of the Franklin Institute that Spanish engineers successfully use ordinary brick dust, made from hard-burned, finely-pulverized bricks, and mixed with common lime and sand, as a substitute for hydraulic cement. The proportions used in general practice are one of brick dust, one of lime, and two of sand, mixed dry and tempered with water in the usual way. Mr. MILES has tested the cement during six years' experience, and found it superior to the best Rosendale. Dr. WAHL, in a note to the above communication, quotes the opinion of Mr. TRAUTWINE that the addition of even as little as one-tenth as much brick dust as sand to our ordinary mortars, would prevent the disintegration so generally visible in the mortars used in masonry.

Red Noses and Electricity.—It is asserted that science has come to the aid of those *bon-vivants* whose principal facial organ betrays by its rubicundity the depth and strength of their potations. The "jolly red nose" of the inordinate lover of alcoholic stimulants, may now be relegated to the list of curable diseases, thanks to a French physician, Dr. BERNIER, who has successfully treated some cases of this kind by the local application of an electric current. Among other patients, a lady of high rank, to whose nose the wire of the doctor's galvanic battery had been applied, has now the satisfaction of moving among her fellow beings free from the bacchanalian hue which had long tainted that important facial organ. This is the latest triumph of electricity.

To Mend Rubber Boots.—G. CABLE asks for a mode of mending rubber boots and shoes. Last year we published the following from a correspondent of the RURAL NEW-YORKER, who has mended them in this wise:—Get a piece of pure rubber—an old shoe; vulcanized rubber will not do—cut into small bits; put into a bottle, and cover to twice its depth with spirits of turpentine or refined coal tar naphtha—not petroleum naphtha. Stop the bottle and set to one side, shaking it frequently. The rubber will soon dissolve. Then take the shoe and press the rip or cut close together, and put on the solution with a camel's hair brush. Continue to apply as fast as it dries, until a thorough coating is formed.

Cement for Aquarium.—Wishing to build an aquarium, I would like to learn from some of your readers, what cement to use, which will stand the water. Also what plants thrive the best. How many plants in an aquarium two feet long and one foot wide?—C. M., *Dearborn, Mich.*

ONE of the largest dealers in aquaria, and cements for them, told us the best cement was made of melted virgin rubber, made into a stiff paste with powdered lime. It was always soft and elastic, and, he said, did not affect the water. But few plants should be grown in an aquarium such as you describe. Your own good taste will suggest what will look well in it. There is no rule governing the matter that we are aware of.

Rats and their Removal.—In answer to S., Walnut Hills, Cincinnati, O., inquiring about rats in RURAL NEW-YORKER, allow me to say that the use of B. ISAACSEN'S "Sure Death, or Phosphorus Paste," will rid the premises of rats at once, and no smell can be noticed. They leave the premises to find water and die before they return. I have used it many years with perfect success, and find it to be the only sure remedy. There is no danger in its use. I have tried all kinds of rat preparations, traps, etc., but give this the best place for the work. ISAACSEN'S powder for bed-bugs and water-bugs is equally sure death every time. Use these remedies or stop grumbling.—MRS. J. L.

Tanning Leather.—The Boston Journal of Chemistry gives what it calls an approved recipe for tanning, as follows:—Soak the skin or hide eight or nine days in water, then put it in lime; take it out, and remove the hair by rubbing it, and soak it in clear water until the lime is entirely out. Put one pound of alum to three of salt, dissolve in a vessel sufficiently large to hold the hide; soak the hide in it three or four days, then take it out, let it get half dry, and then heat or rub it until it becomes pliable. Leather prepared in this process will not do well for shoes, but answers for hamestrings, back bands, and various other purposes on the farm.

Concrete Pipe.—Will any of your numerous correspondents answer the following queries:—What are concrete pipe composed of? What is their comparative strength, say twenty-four inches, for conducting water for town supplies? Are they intended to be used under ground or above ground? Are they placed in ditches made for that purpose, or must they be placed on stone walls? Would they be strong enough to bear their weight, with water, in case the ground, or wall, on which they are placed should give or settle at any place? Are they affected by freezing, &c.?—W. B.

Cheese Meerschaums.—The London Milk Journal says Dr. WAGNER has discovered that cheese will sell readily for meerschaum, having pointed out that casein, mixed with six parts of calcined magnesia and one part of oxide of zinc, and all diluted with water, makes a whitey paste, which, when dry, indurates to such an extent that it will cut like the true article, and is susceptible of a glorious polish.

Solder for Iron and Steel.—A correspondent at Huntington, Tenn., asks some of the readers of the RURAL NEW-YORKER to inform him "how to prepare a solder suitable to solder iron and steel."

Domestic Economy.

BILL OF FARE FOR A WEEK.

Monday's Breakfast.—I thought I would, for the benefit of those that do their own work, or have but little help, furnish a bill of fare, and tell them how to cook it, for one week. I think it impossible for one to give a bill of fare without wasting a great deal, unless one cooks it from day to day one's self, or orders it done. One does not know what will be left; and there is many a good dish made from remnants. I propose to cook for one week, (as my girl has left me,) and give you the bill of fare and how I cook it.

To begin: It is Monday morning, and as there is but little cooked, I shall not have any one's remnants to use, and can have everything of my own cooking. Let me see what there is most handy. Here is buckwheat, ham, eggs, bread, fried cakes, crackers and coffee, of course. Well, I will bake some potatoes and put on the tea-kettle. I can't make coffee until the tea-kettle boils, and that will be time enough, as too much boiling hurts coffee. I browned this coffee myself, on Saturday. I always do. It needs so much care to have it even and nice. I brown but little at a time, and so have it fresh. I will take enough to make two messes, and stir up with an egg; that will save eggs. There are four of us, and that will take eight good, full spoonfuls. Now, while the kettle is boiling, I will set the table. There is one thing I will try and do—to put the cloth on straight. I do like to see a table set nice. I will warm the plates. Now I have—let me see—butter, sirup, fried cakes, crackers and bread. I will not cut much bread, for it may not be wanted—just a few nice little slices. Now for cooking the ham and making coffee. I will scald the milk; it is better, for coffee, to have it hot. It seems as if coffee tasted better, and had a better color, when you scald milk.

My breakfast is done, all but the cakes. Nice baked potatoes, ham, eggs and coffee. I will be particular and get it on the dishes nicely, as that is half. I will always set my table with spoon-holder, castor, and with as much care as if I was expecting company. After breakfast I am going to cook, so as to have more of a variety. I have got bread to make, pies, cake, and dinner to get. When I once get started, I shall have it all go like clock-work. In my next letter I shall tell you how I got, and what I had, for dinner.

Union Springs, N. Y. M. N. R.

ODDS AND ENDS.

Soup Recipe.—I send the following, which my husband pronounces excellent; Put four pounds of fresh beef in six quarts of cold water; let it boil slowly for five or six hours; (I usually boil my meat the preceding day, then take it from the pot and partially skim off the top;) grate, or finely slice, one large or two small carrots; slice two or three onions, one turnip and two potatoes; salt and black pepper to taste; add one-quarter of a red pepper, one tablespoon of summer savory; let these ingredients boil slowly together for nearly two hours. Just before taking up for the table mix a tablespoon of flour in a little cold water; stir into the soup, letting it boil up twice, and your soup is done.—NELLIE A. K., *New London, Conn.*

"Rice Pudding."—If your correspondent, H. H. S., who seems to be fond of rice pudding, will try the following recipe, it will make his mouth water, and he may conclude to emigrate South, where he can cultivate rice and grow fat on rice pudding: Take one teacup full of soft, boiled rice, one tablespoonful of butter, mixed in the rice while hot; add one quart of sweet milk, one teacup of sugar, the yolks of five eggs, season with lemon; bake until done. Beat the whites of the five eggs to a stiff froth, and stir in it five heaping tablespoonfuls of powdered sugar; spread over the custard; return to the oven, and bake a delicate brown.—T. W. C., *Augusta, Ga.*

Graham Gems.—Take half pint sweet milk, half pint cold water; stir into it enough sifted Graham flour to form a batter rather thick for griddle cakes; stir well, and bake immediately. Drop into hot, oiled gem-pans, and bake twenty minutes in a rather hot oven, diminishing heat toward the last. If preferred, they may be made all of milk or cold water, or fine flour, instead of Graham, or half of each.

Graham Crackers.—Take one pint warm water, not hot enough to scald, half cup thick sweet cream; mix with it enough good sifted Graham flour to form a rather stiff dough; knead well, roll thin, cut, prick, and bake in rather quick oven.

The foregoing recipes I *know* to be good.—C. B. M.

Tomatoes in Iron Pots.—There are a thousand and one things I would like to know, (and probably shall, in time, unless I have to learn how to vote,) but this I *do* know, that tomatoes must not be cooked in an *iron pot*. Some beneficent housekeeper, following in the footsteps of the illustrious "scrapple" maker, gives a recipe in last week's RURAL NEW-YORKER for a cheap soup, in which she directs the ingredients to be put in an iron pot. I sometimes, at good tables, taste tomatoes which have been made bitter by this process. If the intention is to medicate them, the result will satisfy the design.—MRS. N. O., *Hohokus, N. J.*

Fancy Home-Made Carpet.—I will send my pattern, which I think very pretty:—The fancy stripe contains two-thirds of white, nine of blue, five of brown, three of yellow, six of green, two of black and white, twisted, four of red, eight of brown, four of red, then the twisted, six of green, three of yellow, two of blue, two of red, two of white, two of black, three of yellow, five of brown, nine of blue, two of white. This is the fancy stripe. The other is "hit and miss," with black on each side. I think it prettier without the "hit and miss"—eighteen black and thirty-four "hit and miss," or fifty-two black. The fancy stripe is made of good colors.—MRS. HAAS, *Meadville, Pa.*

"Peel, and Send to the Table."—This is written of potatoes in the RURAL NEW-YORKER, page 103, of February 10th. Shame on the man or woman who would give such advice! He is certainly a candidate for the insane asylum! Never "peel" your potato before sending it the table! The only time to eat potatoes is when they are *smoking hot*, and then allow no one to cut them with a knife, but always break them, and eat at once, with salt and butter. The delicious flavor of the potato is only enjoyed by this manner of eating.—J. J. T., *Fulton Co., Ga.*

Soda Biscuit.—Into a pan containing five quarts sifted flour, put two even teaspoonfuls pulverized soda and a little salt—having a hole in the center of the flour already prepared; pour into the flour four cups of sour milk—all the better if partly cream; stir the milk and soda a minute, till it foams; then mix with flour into a *stiff* dough, if spring wheat; work but little, and get it into the oven as quickly as possible. Some of my nicest biscuits have been made and baked in twenty minutes.

Domestic Inquiries.—"Housewife" asks for recipes for making the celebrated Boston brown bread and "ginger gems"... "A Young Housewife" wishes "some of the old housekeepers, who know how to make good coffee, would tell her how to do it, so that she may please her (my) husband." Let somebody do so.

Corn Bread.—Take four cups sour milk, one of these partly filled with cream; one egg, a little salt, two even teaspoonfuls pulverized soda; mix the soda with a very little corn meal, and stir altogether, till it foams; then add corn meal till a thin batter is obtained, and pour into hot tins, oiled, an inch deep, and bake in a quick oven.

Feather Cake.—Simple and good:—One cup white sugar, one spoonful butter, one egg, two even cups sifted flour, two-thirds cup sour milk or cream, half teaspoon soda. One teaspoon cream tartar may be used instead of *sour* milk. Flavor to taste.

Coloring Recipes Wanted.—Will some of the readers of the RURAL NEW-YORKER please give a recipe for coloring a permanent red on cotton—such a red as the calico we buy? No alebetta or analine recipes desired.—MRS. G. W. SCOVELL, *Bradford Co., Pa.*

Ginger Cookies.—Take three cups of molasses, one cup sugar, one cup hot water, one cup butter, 1 tablespoonful ginger, two teaspoonfuls saleratus; add flour enough, and knead them so that they will roll well, and they will be found good.—M. S. SMITH.

Vermicelli Soup.—Make a soup of veal, mutton or fowls; add a quarter of a pound of vermicelli; boil it fifteen minutes; add a little mace, a cup of cream just before taking it up, and a small piece of butter; salt and pepper to the taste.

"Floating Island."—Will somebody tell how to make "Floating Island?"—the easiest, plainest and best way.—R.

Modes and Manners.

"DOLLY VARDEN" WALKING SUIT.

We present in this number (see page 213) a charming "Dolly Varden" Walking Suit, which speaks words in its own praise. A plain, self-colored jacket, sashed up at the sides and cut square in the neck, is trimmed with a side pleating one inch and a-half in width. The skirt, corresponding in color with the jacket, is made with a deep, moderately full flounce, headed with narrow side pleating, and finished with a row of velvet ribbon or a bias band of the same material, stitched on. The "Dolly Varden" part of our design is composed of foulard silk—a plain black ground, covered with trailing vines, bright blossoms and bursting buds gracefully intermingled. The corsage is fitted close to the throat, and finished with a ruff of muslin or lace trimmed with Valenciennes. A white chip hat, trimmed with black velvet feathers, pearl buckle and dotted lace, scarf ends, together with a handsome cane parasol, completes this elegant costume.

WHAT I HAVE LEARNED.

I HAVE found, within a five years' social experience, that moral courage is required, for daring, to be *natural*—one's own self, without affectation or insincerity. I have learned that to wear your own hair, in a natural way, is deemed "affectation;" a refusal to wear ear-rings, called "very odd and unfeminine," although you are neither a heathen nor the descendant of a savage; the absence of cosmetics and perfumes from the toilet is sighed over as an indication of total depravity, in the fashionable sense; the wearing of your dresses so you can breathe naturally, considered "horribly unstylish;" the absence of a false lump on your back, deplored more than that of a backbone could be, although you are known to abhor monstrosities, real or assumed. Looking the matter well over, I am sometimes "almost persuaded" that 'tis easier to swim with the tide, and become a complete fashionable fool, letting go all mental and moral reservations, so long doggedly adhered to on the ground of principle.

Talk of moral heroism! I never heard of any greater than that which supports a woman in a rusty gown—and her only one—when forced into a company harmonious in its display of silk and velvets and jewels. It is a feeling but few men are capable of understanding. Any woman who can rise superior to her raiment under such circumstances, I nominate for a leader in the matter of dress reform. Where is she?

MINTWOOD.

MINTWOOD'S CONVERSAZIONE.

Magnetic Curling Comb.—A Lady Subscriber asks if the "Electro Magnetic Curling Comb," advertised in RURAL NEW-YORKER, can be relied upon for curling straight hair as represented, etc. She fears it may be a humbug, but having a great desire for curls, wishes to know positively of its merits. MINTWOOD knows nothing whatever about it; but if the manufacturers will send a comb to the RURAL office, she will give it a thorough trial upon the first straight haired creature that will submit to the experiment, and then report success. Meantime she advises the girls to be patient, and hold fast to their "pin" money.

To Do Up Hair.—"How shall I do up my hair? It is nearly two inches below my waist, and rather thick. A roll is too heavy and warm, and not only gives me a headache, but causes my hair to fall out. What is fashionable for girls to wear in their hair—ribbons, feathers, flowers or ornaments?" Part off a slip of each side front, which make into two or more curls. Plait your back hair loosely, in two Chinese braids, and let them fall straight down the back, with a black velvet, or other ribbon, at the end. Fasten the curls to the back, well up on the head, with a bow; they will hang between the plaits. Wear a shell or jet bandeau over the front. All the ornaments you mention are worn in the hair, to suit one's style—a bow, sash or rosette may be worn at the back of the dress, with or without overskirt. Neck ribbons with long ends falling at the back, are still worn by some. An engagement ring is now worn on the third finger of the left hand.

Waterproof Dresses.—MARY L., Washington Territory. Make your waterproof dress with a plain skirt and polonaise. Finish the bottom of polonaise in scallops bound with braid or with bullion fringe. Your changeable goods, of blue and brown, may be trimmed with a mixed fringe, or with folds of alpaca or poplin in either shade of color.

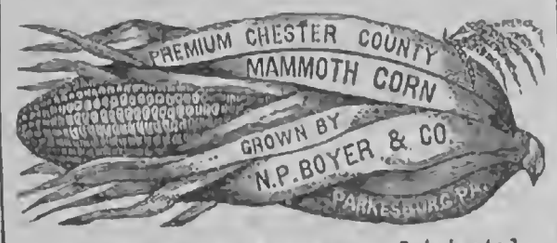
Seeds, Plants, Etc.

CORN CORN CORN CORN CORN CORN CORN CORN CORN

The Best and Most Productive Variety in the World for Field Culture.



How this Variety of Corn was Originated.

This celebrated variety has been brought to its present perfection by planting largest, most prolific and earliest kinds for a series of years and annually selecting the earliest ripening, largest and most prolific ears for seed.

120 to 150 Bushels of Shelled Corn Grown Per Acre.

In order to show that it is NO HUMBUG, we have put up 500,000 small SAMPLE PACKAGES, which we will send FREE to all who send stamp to pay postage.

What we Claim for the Chester County Mammoth Corn:

The important points of superiority claimed for this corn over other varieties, and which are fully sustained by the voluntary statements of farmers who raised from seed got of us last year, are these:

1st. This corn will yield from twice to three times as many bushels to the acre on the same soil and with the same culture.

3d. The stalks grow more vigorous and healthy, and sufficiently strong to produce one or two very large ears.

4th. The stalks bear more foliage and is better for feeding.

5th. That it will grow and produce a profitable crop on ground where other corn will not grow to maturity.

6th. It ripens earlier and is not liable to be caught by frost.

7th. To be cut green and used for feeding, it is fifty per cent. better than any other variety of corn.

Our corn has all been selected with the greatest care, the small end of every ear broken off, the balance shelled by hand.

We Warrant Every Grain of it to Grow.

The increase yield per acre over the old varieties will pay for the seed twenty times over, besides every farmer that plants this year will have a large demand for seed at good prices. SEND FOR CIRCULARS AND TESTIMONIALS.

Price $2.50 per peck; $5 a bushel; five bushels $20.

Address N. P. BOYER & CO., Parkesburg, Chester Co., Pa.

NEW AND RARE VEGETABLES.

I make the seed of New and Rare Vegetables a specialty, besides raising all the common varieties. On the cover of my Catalogue will be found extracts from letters received from farmers and gardeners residing in over thirty different States and Territories who have used my seed from one to ten years.

Catalogues sent, Free, to all. ☞ I grow over one hundred varieties. Get your seed directly from the grower. JAMES J. H. GREGORY, Marblehead, Mass.

"PROGRESS AND IMPROVEMENT."

MOORE'S RURAL NEW-YORKER.

A NATIONAL ILLUSTRATED

RURAL, LITERARY AND FAMILY NEWSPAPER.

D. D. T. MOORE,

Conducting Editor and Proprietor.

PUBLICATION OFFICES:

No 5 Beekman Street, New York City, and No. 82 Buffalo Street, Rochester, N. Y.

WESTERN BRANCH OFFICE

No. 75 North Side of Park, Cleveland, Ohio.

TERMS, IN ADVANCE:

Subscription.—Single Copy, $2.00 per Year. To Clubs:—Five Copies, and one copy free to Agent or getter up of Club, for $12.50; Seven Copies and one free, for $16; Ten Copies, and one free, $20—only $2 per copy. As we are obliged to pre-pay the American postage on papers mailed to foreign countries, Twenty Cents should be added to above rates for each yearly copy mailed to Canada, and One Dollar per copy to Europe. Drafts, Post-Office Money Orders and Registered Letters may be mailed at our risk. ☞ Liberal Premiums to all Club Agents who do not take free copies. Specimen Numbers, Show-Bills, &c., sent free.

The Rural New-Yorker is sold by News Dealers generally throughout the United States and Canada at Six Cents. The Trade is supplied by the AMERICAN NEWS CO., 119-121 Nassau St., New York.

Advertising.—Inside, 75 cents per line. Agate space; Outside, $1 per line, each insertion. For Extra Display and Cuts, a price and a-half. Special and Business Notices, $1.50 and $2 a line. No advertisement inserted for less than $3.

SATURDAY, MARCH 30, 1872.

A NEW QUARTER,

AND A GOOD STARTING POINT!

AGENTS and others interested, are reminded that a New Quarter of the RURAL NEW-YORKER will begin next week—April 6—affording a good starting point for all who wish to take the paper. We hope that not only all our Club Agents, but every Subscriber also, will bear this in mind, and kindly see what may be done toward increasing our circulation among those who would be benefited by taking the RURAL. The season is at hand when thousands who do not now take it will want to consult the pages of this Journal concerning operations in Garden, Orchard and Field, and we ask those who know its value to introduce it to notice and support in their respective localities. Those forming new clubs, or making additions to old ones, will be entitled to the same Premiums offered in January—so that all aiding the RURAL will not only have the consciousness of doing good to others, but be liberally rewarded therefor.

CHANGING BUSINESS.

ONE of those periodical rushes—out of one business into another—is at hand among farmers. We see the indications of it, hear and read of it, and know the tendency of mankind well enough to know it is to be. We do not deprecate it as much as we might, did we not know that while one class loses another gains; and that, in the aggregate, so far as consumers are concerned, there is little loss. The wool clip of 1872 is being contracted for at 65 to 75 cents, and many growers expect to realize 90 cents and $1 per pound. Cheese and butter have been comparatively low. The rush into the dairy business, and the abandonment of sheep husbandry, have conspired to produce this result. The contract prices of wool named above are quite enough to set the unstable husbandman crazy for change. Thousands will abandon the dairy for wool growing. They will not resist the temptation. They will sell their cows this spring for what it has cost (or less) to winter them, their dairy utensils at a sacrifice, and buy sheep of those who have had the pluck and good sense to keep them through the past years of wool depression, at round prices—sufficient (with the appreciation in the price of wool) to cover all the past losses of the plucky shepherds.

What then? Those who cling to their dairies, and strain every nerve to produce cheese and butter of the best quality, largely, will reap a harvest in consequence. For when there is a rush out of any specialty in production, (as we have often said before in these columns,) it is the time to go into it. Let young farmers, who can, buy cows cheap this spring—buy them rather than sheep at high prices. Sell sheep when they are high, and buy cows while they are low. Our word for it, the gain will be sure, if there is any law to be deduced from the facts and experiences of the past. During a not very long life, we have witnessed many of these revolutions in business—these epidemic changes from one specialty to another—and we have found it to be infallibly true, that the diversion of labor and capital from one channel of production to another, enhances the market value of the lower product, and depreciates that of the higher; and the depreciation in price of butter and cheese is not yet so great as to destroy all margin of profit to the producer thereof.

We have said this much in reply to "A Young Farmer" who asks us if we would advise him to stock his newly purchased farm with sheep or cows this spring. Our rule would be, always, to buy live stock, of whatever character, when it is low, and sell it when it is high—if we sold at all. For, while the aggregate receipts from such an investment may not be as large, the per cent. of profit will be likely to be greater; for the man whose cows cost him $50 each, can sell cheese for less money than he who pays $100 each for his herd. Doubtless there will be money made in the sheep business; but every dollar and every hour's labor diverted from the dairy business, will enhance the value of dairy products; for not a whit less butter and cheese will be eaten and less will be made—all such changes involving a decrease of production.

RURAL NOTES AND QUERIES.

Tried and Approved.—The New Style and Improved Form of the RURAL NEW-YORKER has now been before the public for three months, and the almost universal verdict is in its favor. Of the hundreds of notices we have received from exchanges, not one has been unfavorable, while many speak in the highest terms of the change. Our letters from the people are nearly as unanimous in approving the change, though a few prefer the old form, and one subscriber don't like the RURAL'S new vignette heading! Two or three object to the large pictures given, and one wiseacre thinks they are put in to fill space and save cost! The fact is that such engravings as we usually give cost more than ten times the expense of type-setting for the space they occupy. It is possible, however, that we have given "too much of a good thing," in the way of illustrations, during the past few months,—but if so, we can reform in the future and save considerable by the operation. One man, who subscribed for the RURAL because we reduced the form, wants us to make the page half the present size—making thirty-two instead of sixteen pages.

Wish we could please everybody, but the truth is that the RURAL, as now issued, is so generally and highly approved by most people that we reckon it will not pay to try. And yet, we hope to make some improvements as we advance—such as will be recognized and appreciated by all who are intelligent and discriminating.

Business Law.—Read and keep the following summary of business law. It is the gist or kernel of a vast amount of verbiage:

It is not legally necessary to say on a note "for value received." A note on Sunday is void. Contracts made on Sunday cannot be enforced. A note by a minor is void. A contract made with a minor is void. A contract made with a lunatic is void. A note obtained by fraud, or from a person in a state of intoxication, cannot be collected. If a note is lost or stolen, it does not release the maker; he must pay it, if the consideration for which it was given, and the amount, can be proven. An endorser of a note is exempt from liability, if not served with notice of dishonor within twenty-four hours of its non-payment. Notes bear interest only when so stated. Principals are responsible for the acts of their agents. Each individual in a partnership is responsible for the whole amount of the debts of the firm. Ignorance of the law excuses no one. It is a fraud to conceal a fraud. The law compels no one to do impossibilities. An agreement without consideration is void. Signatures made with a lead pencil are good in law. A receipt for money is not always conclusive. The acts of one partner bind all the rest.

Wheat Turning to Chess.—We are receiving correspondence which attempts to prove that wheat will, or will not, turn to chess. We can use our columns to better purpose than to print it. There is no argument or statement of facts that will prove to some people that wheat does not turn to chess; and nothing but an actual demonstration will satisfy other people that it does. So, what's the use of spending paper and ink upon what many honest and intelligent men can only be satisfied about by experiment for themselves? During the past twenty years, we have seen arguments, *pro* and *con*; but we have no more light on the subject than we had then; and we have never *seen* any actual proof that wheat does turn to chess in that whole time. May be it does, but we don't believe it, and do not care to discuss the question.

Buying and Distributing Home-Grown Seeds free, on the part of the Department of Agriculture, ought to cease. There is neither excuse for it nor sense in it. If, through Government agents abroad, the Department can secure new seeds or plants, not heretofore introduced in this country, and which have, or are supposed to have, a distinctive or especial economic value here, their introduction and dissemination is excusable. But there is no excuse for the policy which buys new seed corn, wheat, or potatoes of domestic growers, and distributes it free to the few who may be favored by the Department.

Artificial Florists in London.—From a recent English paper, we learn there are about 170 firms of artificial florists in London—one-half of whom are manufacturers. Of the latter, ten houses employ 200 hands each; ten more, 100 each. Altogether, 4,000 to 5,000 women and children find employment in this fancy trade. It was once an unhealthful business, because of the poisonous substances used in coloring; but since the introduction of analine dyes, this objection has ceased. The average earnings for first-class hands is 15s. per week. Some talented artists get £100 to £150 per annum. Second-class hands average 10s. per week.

Warren's Patent Cooking Pot is one of the most perfect cooking conveniences lately introduced. In it meat is cooked by its own juices, without access of water, thus preserving the natural flavor and making a large saving,—for there is *no* waste or loss in cooking when this article is used. We have tested it, and know whereof we affirm. By its use meat, a pudding, and two kinds of vegetables may be cooked at once, with no more fuel than is needed to keep two quarts of water at the boiling point. This is a convenience in winter, but an absolute comfort in summer. Besides this, the worst cook cannot spoil the dinner, nor the best one improve the condition of the meat cooked in the Warren Pot. The Newport Lead Works of Newport, R. I., have done the country a service by introducing this very convenient and necessary addition to our kitchen appliances.

Nursery Book Wanted.—I have been looking over your list of books, to find one treating on the growing of seeds for fruit and ornamental trees; in other words, a Nurseryman's Guide. I was thinking there was such an one published by BARRY; if so, please give price, or that of any other good work on same subject.—A SUBSCRIBER, *Junction City, Kan.*

THERE is no one book published that treats thoroughly and fully on all the subjects you name, but "Barry's Fruit Garden," and "Thomas' American Fruit Culturist," will assist you much. The former is out of print; the latter is for sale at this office.

Sugar Cane Seed.—S. L. R., Coffeysville, Kan., asks where he can get Southern Sugar Cane seed, and says:—"I want to make some sugar, if I can get the seed. I have the seed to make molasses." Southern sugar cane (*Sacharinum officinarum*) is not propagated from seed, but from cuttings. We do not know of whom the cuttings can be obtained, but advise you to write to the Editor of the Rural Southland, New Orleans, La., for such information.

The Hop Crop of 1872.—Our advices indicate that there is to be a lively stir this year among hop growers. We caution against increasing the acreage cultivated. The present high prices cannot be maintained unless the English and German crops fail; for with the area cultivated in hops, the home demand can be met, and something left for export. Such is the testimony of men well posted in the business.

X. A. Willard's Address Before the Ohio Dairymen's Ass'n is published by the Association, and we learn that 3,000 copies have been printed for distribution among Ohio farmers. It may be had by addressing the Secretary and Treasurer, Col. S. D. HARRIS, Cleveland, O., or the Corresponding Secretary, ANSON BARTLETT, West Jefferson, O.

Short Stories.—The serial story which we conclude this week has occupied much more space than we anticipated. In future we shall aim to give short stories, generally such as can be published entire in one paper. This we think will be more satisfactory to readers, and enable us to furnish a greater variety.

THE SEASON.

Half-Day, Ill., March 5.—Old wells are playing out, and cisterns are "just holes in the ground." We hope for better days.—J. C. L.

Arcola, Douglas Co., Ill., March 12.—Fruit all right; wheat and rye backward. Winter has been cold, dry; snowing all day to-day. Times hard; money scarce; stock low.—BAGDAD.

Margir, Wood Co., O., March 15.—Stormy weather; snow the 14th. Stock looks well; wheat badly; many fields will be plowed up and sown to oats. Wheat, $1.40; corn, 50c.; oats, 32c.; hay, $8; eggs, 18c.; butter, 18c.—R. W.

Williamstown, Mass., March 19.—Very cold; no sap weather yet; snow all in heaps. A year ago I commenced planting potatoes on St. Patrick's day, and now the very place is several feet under snow. Water very scarce; stock suffers.—L. A. V. G.

West Milton, Saratoga Co., N. Y., March 7.—Sleighing very good. Pleasant winter, though somewhat cold; business lively. Butter, new, dull at 20c.; fall butter equal to demand, at 25@28c.; cheese, new, plenty at 14@16c.; potatoes plenty at $1@1.25.—Q. U. E.

South Trenton, Oneida Co., N. Y., March 19.—Winter came on us with swamps, wells and the lower springs nearly dry. Now, springs that never, within the memory of the oldest inhabitant, failed before, are entirely dry. Cattle are driven miles for water, and some families are obliged to melt snow for stock.—S. B.

Sparta, Hancock Co., Ga., March 16.—Weather rather cool. Planters very much behind with their work, the winter has been so very cold and wet; the coldest in a great many years—sixteen at least. Provisions low and plenty, but money very scarce. Spring backward by at least three weeks; not a peach bloom to be seen yet; plum blossoms just opening; peas and Irish potatoes about all that are as yet planted in gardens. Nearly every planter will plant largely in cotton, and yet censure his neighbors for not planting less cotton and more corn and grain.—H. A. C.

RURAL BREVITIES.

FIG plants, SARAH W. C. is informed, can be obtained of almost any plantsman.

THE St. Louis, Mo., Poultry Association issues a monthly called the American Poultry Gazette.

THE assessed value of horses in Ohio in 1870 is stated to be $57,559,416—$93,542 less than in 1869.

A MOVEMENT is making in Indiana to call a Convention of the Short-Horn breeders of the State.

IT is announced that California has hired a State Tree-Planter at a cost of $15,000 a year and expenses.

THE Western Farmer says but little Wisconsin tobacco has been sold yet. Some sales at 12@13c. "through."

OUR tobacco quotations (in reply to I. COLE) are for the crop of 1870. We shall quote the crop of 1871 early in April.

BEFORE you cut the RURAL NEW-YORKER take it to the sewing machine and sew it down the back, if you have no file for it.

GEORGE C. BRAGDON of the Financier, has been invited to deliver the Poem before the N. Y. State Editorial Convention, which meets in Watertown in June.

SOUTHERN planters are agitating the organization of co-operative purchasing companies. They are sometimes a source of profit and sometimes of loss to members.

A. CORBIN, Jr., New York, has purchased of A. W. DOLSON, Columbus, O., the thorough-bred stallion "Scythian," bred by Mr. ALEXANDER of Ky., and for which Mr. DOLSON paid $2,250 when 3 years old.

THE College Term of the Iowa Agricultural College commenced March 6. The buildings accommodate 250 pupils, and every room is engaged, and many applicants have been refused admittance for want of accommodations.

THE next volume of Transactions of the Illinois State Horticultural Society is to contain a steel engraving of CYRUS R. OVERMAN, one of the pioneers and most enthusiastic workers in Illinois horticulture.

A ROAD STEAMER is being built in Philadelphia, which the manufacturers are confident is adapted to travel on common roads, and that will be useful for all the purposes for which traction engines are needed.

H. P. PATTERSON, San Jose, Cal., writes us of a beet grown by Z. M. BROWN, near San Jose, which weighs 175 pounds, measuring six feet long (tops and roots) and three feet in circumference. It grew within twelve months from seed, with irrigation, but without manure.

PUBLISHER'S SPECIAL NOTICES.

"Time Up"—New Quarter, &c.—All our readers whose subscriptions expire this week will find the No. of the paper (1157) printed after their names on the address label. We trust that all such will at once renew, if they desire the uninterrupted visits of the RURAL. And as a New Quarter begins next week, now is not only the time for renewals, but for people to subscribe. Reader, please note this, and invite your friends accordingly.

The Scholarship Premiums.—Those of our young friends who have formed clubs for the RURAL and competed for the Extra Premiums, (Scholarships in the Claverack College and Hudson River Institute,) will please give us their ages, and also state how many subscribers they remitted for previous to March 1. It will be remembered that our offer was to persons under 21 years of age, and in order to make the awards properly those competitors who have not given their ages should do so at once.

Additions to Clubs are always in order, whether in ones, twos, fives, tens, or more. A host of people are subscribing for papers about these days, and we hope our Agent-Friends will give everybody an opportunity to subscribe for the best.

Show Bills, Specimen Numbers, Etc., of the RURAL NEW-YORKER sent free.

SPECIAL NOTICE TO ADVERTISERS.

INCREASE OF RATES.

AFTER April 1, 1872, the Rates for Advertising in MOORE'S RURAL NEW-YORKER will be as follows:

Inside, 14th and 15th pages (Agate space)	30c. per line.
" 5th, 7th, and 13 pages	1.00 "
Outside or last page	1.50 "
Fifty per cent. extra for unusual display.	
Special Notices, leaded, (by count)	2.00 "
Business "	2.50 "
Reading "	3.00 "

All orders for Advertising received at the New York office on or before April 1st will be charged at present rates only. For at least one cogent reason for our advance, or "New Departure," in Advertising Rates, see RURAL Feb. 24.

BUSINESS NOTICES.

DR. STRONG'S REMEDIAL INSTITUTE,

Saratoga Springs, N. Y., is unsurpassed in the treatment of Lung, Female and Chronic Diseases. Turkish, Russian, Electro-Thermal and Sulphur-Air Baths. Hydropathy, Vacuum Treatment, Movement Cure, Oxygen, Calisthenics, &c. TERMS LOWEST IN WINTER. Send for a Circular. Endorsed by Bishop Janes, Rev. T. L. Cuyler, D. D., and Tayler Lewis, LL. D.

The Lungs are Strained and Racked by a persistent Cough, the general strength wasted, and an incurable complaint established thereby. Dr. Jayne's Expectorant is an effective remedy for Coughs and Colds, and exerts a beneficial effect on the Pulmonary and Bronchial Organs.

HOW TO OBTAIN A "COLLINS"

Solid *Cast* Cast-Steel Plow for $5. For particulars, address COLLINS & CO., 212 Water St., N. Y.

THE WAKEFIELD EARTH CLOSET.

Get Descriptive Pamphlet at 38 Dey St., New York.

Burnett's Cocoaine dresses the hair perfectly, without greasing, drying or stiffening it.

Biographical.

THE QUEEN OF ENGLAND.

GREAT BRITAIN has never known so happy and prosperous a period as under the reign of VICTORIA, the present Queen, whose portrait we give herewith, from a recent photograph. Her sovereignty has extended to thirty-four years, and recently the people of England, by millions, testified their love and loyalty in an overwhelming manner. She is the only child of his Royal Highness, the Duke of Kent, fourth son of King GEORGE III. She was born at Kensington Palace, May 24, 1819. All of her uncles having died without children, the crown fell to VICTORIA on June 20, 1837, upon the occasion of the death of King WILLIAM IV. She was then 18 years of age. The oaths were administered, and she took her seat in the Council Chamber. Parliament granted her £385,000 per year for the expenses of her court, and gave her mother £30,000 a year.

Her coronation took place at Westminster Abbey, June 28, 1838. It was a very gorgeous affair. On the 10th of February, 1840, she was married in the Chapel Royal, St. James's, to Prince ALBERT of Saxe-Coburg and Saxe-Gotha. Using the privilege of her rank, she invited him to make her his wife. Her wedded life lasted 21 years, and was full of happiness, "the blameless Prince" proving a model husband and wise counsellor. Five different attempts to take her life have been made, but all proved fruitless, and were the work of half insane men or boys. While Prince ALBERT lived she frequently visited various parts of the United Kingdom, making her third visit to Ireland in 1861. On the 14th of December, of that year, the Prince Consort died, since which time the Queen has shunned public festivals, and worn mourning. In 1863 she went to Coburg, Germany, to acknowledge a memorial erected to her husband. She has always taken a deep interest in the prosperity of London, laying many corner stones, opening bridges, halls, etc. We are told that the Queen reads the daily newpapers, thinks and talks and writes of public affairs, practises the habits of a woman of business, and studies every subject of general importance more diligently than nine-tenths of the educated ladies and gentlemen of England. She is known to have some practical skill in the arts of drawing and music, and a highly cultivated taste. Her royal sons and daughters number nine. During the recent sickness of the Prince of Wales she was constantly by his bedside, and all English speaking people sympathized with her in her affliction. The recent Thanksgiving in London was her last appearance in public, and caused immense rejoicing. The Queen will soon pay a visit to her daughter in Berlin.

THE QUEEN OF ENGLAND.

GAIL HAMILTON.

MISS GRUNDY writes from Washington: Among our winter visitors is Gail Hamilton, who spends several months at a time as the guest of her cousin, Mrs. Blaine, wife of the Speaker of the House. As is well known, the real name of this clever writer is Abigail Dodge. She is a native of Wenham, a small town about twenty miles from Boston, but her home is in Hamilton, Massachusetts. The abbreviation of her given name and the name of the town in which she resides suggested her *nom de plume*. Miss Dodge entered the field of letters while residing in Washington. She first came here as a governess in the family of Dr. Bailey, of the National Era. She is remembered by those who knew her then as a shy, timid, sensitive little girl, who could scarcely be induced to mix at all in society. Struck by her brightness and originality Dr. and Mrs. Bailey vainly endeavored to induce her to see their visitors and make acquaintances. Presently the Era received sparkling articles from an unknown writer, signing "Gail Hamilton." These were, of course, published, and their authorship never suspected by the Baileys, who discussed before the shy little governess the new contributions to the paper. After some time Miss Dodge acknowledged herself to be the writer, and was greatly encouraged by her kind friends. She continued to write for the Era, and when she published her first book it was under the auspices of Dr. Bailey, by whom she was introduced to a publisher. Miss Dodge, while she is not handsome, is rendered attractive by her pleasant manners and great vivacity in conversation.

CHIEF JUSTICE CHASE AT HOME.

A WASHINGTON correspondent writing about Chief Justice CHASE, says: — Last spring, when I saw him as he passed through our State, he was then improving in health, but still feeble. Last week I saw him at his house, and spent many hours with him there. Together we walked over his place, about fifty acres, two miles North of the Capitol—a charming location, with plain but comfortable buildings, and affording one of the finest prospects of any place near the city. I was rejoiced to find how greatly he had improved physically, and his mind, which was never really impaired, seemed as vigorous as ever. In the evening he examined several cases which had been argued and submitted, and gave his opinion upon them with great promptness and clearness.

He goes to the Capitol daily, frequently, in pleasant weather, walking the whole distance, and holds court from 11 to 3. He then returns home and enjoys the quiet of comparative seclusion. I found his mind considerably occupied with agricultural improvements; and, like many others who have passed through the struggles and cares incident to public life, he gladly finds a few hours of peace and exhilaration in the cultivation and improvement of a quiet homestead.

JOSEPH MAZZINI.

JOSEPH MAZZINI, the Italian liberator and the terror of imperialists everywhere, died last week in Pisa. He had been a revolutionist all his life. His time, talent, body and the whole energy of his soul were devoted to secure a united Italy. He had headed numerous invading and revolutionary factions, enduring to the utmost and risking everything that most people hold dear, to make Rome the capital of his whole country. He met some success, but he oftener failed. He was hunted and banished time and again, but he never gave up his one idea, and but few crowned heads felt themselves absolutely safe while he lived. To be sure, the end he aimed at has been reached, but by other parties and in a different way. He himself took no active part in the final movement, but who shall say that a favorable result would have been possible without his early efforts?

MR. BOUTWELL, Secretary of the Treasury, is a man of medium size, of wiry frame, self-possessed, and temperate in all things. He takes good care of himself—especially depending on billiards for exercise. For that game he has a passion, and amid the click of ivory balls he eases his mind of the cares of State.

Our Story-Teller.

BEFORE AND AFTER.

A THRILLING ROMANCE OF THE WAR FOR THE UNION.

Written Expressly for Moore's Rural New-Yorker, BY TWO WELL-KNOWN AUTHORS.

[Concluded from page 201.]

XII.—Searching for Alfred.

WHEN NED ARNOLD went home after seeing ALFRED'S name, he was in a state of painful uncertainty. He had news, but news of the most depressing kind, and he debated with himself whether it were not better to say nothing of what he had seen till he could make inquiries, and find out something more definite.

"It will do no good to tell them," he said, thoughtfully, "and may do a great deal of harm. Mrs. HEATHERSTONE will have hysterics all the time, and MAGGIE and SUSAN will know no peace. I think, on the whole, I'll keep my discovery to myself."

But NED reckoned without his host. He had not counted on HANNIBAL'S sharp sight and ready intuition.

"Sumfin de matter wid young Massa," said the old negro, after a close scrutiny of NED'S perplexed face. "Better tell ole HANNIBAL all about it. Pears like taint best to keep our tribulations all inside; dey grow smaller when dey get shared. It's all in de right order of tings; what we divide we don't hab so much of ourselves. Don't Massa NED see?"

Massa NED saw and was very glad to confide his anxiety to the wise old friend, so ready to share all their grief, and to lighten it if he could.

"The truth is, HANNIBAL, said he, casting as he spoke an uneasy glance around the little hall into which HANNIBAL had drawn him, "the truth is, I have had news from ALFRED."

"News from Massa ALFRED, and no good news, or Massa NED not look so down in de mouf. Will de young Massa hab de goodness to go on. De good LORD must be in dis as in everyting else."

HANNIBAL'S faith in the Divine fitness of things seemed to inspire NED with fresh courage.

"Bless you," said he, "of course it must come out right. I won't doubt again. I don't believe ALFRED has lived through all the dangers of war to die so near us. We shall find him, HANNIBAL."

"But Massa NED hab not told yet what he fear."

"HANNIBAL, ALFRED was in New York a few days ago, and knowing nothing of our movements left, as I suppose, for the South, and in a dying condition, from all that I can hear."

A shrill scream interrupted the conversation, and turning sharply round, the two men were shocked at seeing Mrs. HEATHERSTONE in the doorway, evidently in possession of all the painful truth. MARGARET and SUSAN came running in, and for a few moments the confusion hindered any explanation.

"ALFRED is dead! ALFRED is dead!" moaned the hysterical mother. "We shall never see him again!"

For once HANNIBAL'S indignation mastered his reverence, and, looking tenderly at MARGARET'S white, appealing face, he said, abruptly:

"Tain't no such ting, Sunshine. Missus 'zaggerates. Massa ALFRED no more dead dan ole HANNIBAL hisself, and he live enuf, bress de LORD."

"Are you sure, HANNIBAL? Come with me. SUSAN will care for mamma. Now tell me all about it."

"All about it" took but a minute to tell. HARRY came in, and was consulted. And

the little group anxiously asked each other what was to be done.

"Somebody must go to Virginia at once," said HARRY. I will start this afternoon. If ALFRED should reach the old place, sick and worn out, it would be dreadful to find no one to receive him. And he might die for want of care."

"I will go with you," said MAGGIE.

"Can you leave mother?"

"No," replied the young wife, with a sigh. "I must stay, but you had better take HANNIBAL."

So it was arranged, and before night HARRY and HANNIBAL were *en route* for Washington. In two days from their departure, and before they had been heard from, NED started for the West.

"In less than a week we will have HOPE with us," he said to MAGGIE, by way of farewell. "HARRY will bring ALLRED back, I am sure of it, and then how happy we shall be."

MAGGIE smiled through her tears. "I trust you are right," she said, softly; I cannot believe that ALFRED will be taken from us now. We should hear from HARRY today. If I get good news I will send a telegram to meet you on your arrival at Chicago."

"Do, MAGGIE, and now good-by, which is in very deed, God be with you."

HARRY wrote from Washington a letter full of good cheer. MARGARET'S spirits revived, and she manaaged, assisted by SUSAN, to iufuse a little courage into the heart of her discouraged mother.

"ALFRED will be with us soon," she said blithely. "HOPE will come, too; they will be married, and then what more could we ask, mamma mine. I know dear papa and GEORGE can never come back," she went on, answering her mother's mournful look; "but isn't it something to have your own little MAGGIE and HARRY and SUSAN, and isn't there a future for us, in spite of all the past?"

Into this hopeful atmosphere came a telegram from HARRY.

"ALFRED has not been heard from at home. I shall stay a day or two, hoping he will arrivo."

Days of suspense they were that elapsed before HARRY'S return—a suspense harder to bear than the most dreadful certainty; and when he returned, having found no trace whatever of ALFRED, MAGGIE regretted from her soul the chance that led NED to mention the name that had raised their hopes, only to ruin them once more.

Her greatest anxiety now was for HOPE ARNOLD. She knew that NED would tell her all, and she would confidently expect to find ALFRED in New York.

"It is cruel," said she to HANNIBAL. "She has suffered enough—we have all suffered enough—without this disappointment."

"Miss MAGGIE not seen all yet. It no right to judge of de work till all be done. But dat de way wid us all, mostly; we neber gib de LORD time enough."

"Waiting is so hard, dear HANNIBAL."

"De hardest of all t'ings, 'less de faith be bery strong; den it is not so hard. What make de waiting hard, is dat we no sure de t'ing will come at last, If we sure of dat, it much easier."

"Of course. But how can we be sure?"

"Did Miss MAGGIE eber know a father dat 'fused de chillens what dey wanted, if dey would give he time to make t'ings come right?"

"Well, HANNIBAL, GOD don't always give us what we want."

"Not allus, Miss MAGGIE, what you tink you want; but if He take anyting away, He allus put someting better in de place, if de heart be right to 'ceive it."

Do the best she could, MAGGIE could not think of HOPE without dread. But she had not long to fear, for she received a letter soon after HARRY'S return, saying that the exile would be with them that night.

The afternoon waned drearily, and while SUSAN, assisted by MAGGIE, prepared the simple dinner, old HANNIBAL watched for the carriage. At last it rolled up to the door, and HOPE'S sweet face was seen at the window. HANNIBAL went straight to the girl, and said in his earnest way: "Ole HANNIBAL mean to see de little Missus fust, to comfort her. Massa ALFRED still in a mystery; but de LORD look straight frou all de darkness as if it light, and HANNIBAL know Miss HOPE trust Him."

The old man delivered this little speech with great rapidity, and had scarcely uttered the last word before MAGGIE and HOPE were in each other's arms.

"I know, HANNIBAL has told me," HOPE said to MAGGIE, as they went into the house. "We have waited long, and we must wait longer still."

"And you are HOPE still?" said MAGGIE.

"Yes," answered the darling girl, but breaking down, utterly, as she spoke.

"Can't we be alone, MAGGIE, to-night? I would rather not see any one but you."

"Yes, dear; SUSAN shall bring our dinner here to this little room, that I have called HOPE'S room ever since we have been here."

"Thank you, MAGGIE. To-morrow I shall be stronger. It's all right, MAGGIE. We won't despair yet."

ALFRED HEATHERSTONE had experienced strange vicissitudes since parting from his friends. For months he had followed his profession in the army, bravely and untiringly yielding to all that it demands of a loyal soul and tender heart. Many a poor fellow had reason to bless Dr. HEATHERSTONE for the life he had saved, and many a life went out more peacefully for the loving sympathy of the large-hearted surgeon. Suddenly ALFRED disappeared. He was last seen upon an English frigate, by a polite figure of speech called neutral, and his friends who were in communication with the HEATHERSTONES did not possess even this clue to his whereabouts. To his family his fate was an absolute blank. The frigate, whose mate he had been called to attend, had suddenly headed for insular Europe, warned by the vicinity of an iron clad, the commander of which understood her "neutral" character, without so much as taking time to land the men on board who did not belong to her. Protestations were useless. The captain was thoroughly scared, and made the utmost possible speed, never breathing freely till he had dropped anchor in Liverpool. The anxiety of this forced voyage, combined with previous overwork, and the wear and tear of heart and head incident to his position and his relations, threw ALFRED into a brain fever before he was half way across the Atlantic, and for weeks after his arrival in England he was unconscious of all his surroundings. While he lay in his darkened room in Liverpool, living over in his delirium the dreadful scenes of the war, the old home was deserted, as we have seen, his little MAGGIE married, his darling HOPE working patiently day after day in exile and sorrow, and when on his recovery, or partial recovery, he left England thinking only of regaining his home and friends, no dream or doubt even had warned him of the change. His only thought was, the war is over and we will be happy again. HOPE shall come to us, and then, if we cannot live in Virginia, we will go to seek our fortunes and make a new home for love and peace to dwell in. The new home was already made, and he went straight by it, seeking for the old one. After resting at the St. Nicholas, he thought himself sufficiently strong to continue his journey, but before he was two hours from the city, on his way to Washington, he fainted in the car.

"There's no sense in keeping him on these cars," said a passenger, who had been bathing his head. "What he needs is perfect rest and quiet. He is in a critical condition, and must have been crazy to think of traveling alone."

"Likely 'twas necessary," said a motherly old woman near by. Folks can't always choose when to travel."

"That's so. There, he's coming to. Do you feel better, sir?"

"A little. Where am I—in Virginia?"

"In Virginia, indeed! Why, sir, you're not two hours out of New York. You must stop at the next station, and I will stop with you; I'm not in such a hurry that I can't give a little time to a sick man. I was sick myself once in a foreign country, and I shall never forget the kindness of a stranger who nursed me back to life."

In the little village where ALFRED and his new friend found comfortable quarters, the weakness that had conquered him in the car continued day after day, till the sick man was discouraged. He had caused letters to be written to Virginia, and, receiving no reply, grew so impatient and hopeless that his friend and nurse feared the worst for him.

"We must do something, or we shall lose him," he said, to the physician, at the close of a weary day. Suppose we send a messenger to Virginia to get some news of this man's friends. I confess I fear to do it; but he may as well know the worst. This war has made terrible work, doctor."

"Terrible work," replied the man of medicine. "I think you are right; suspense is killing our patient. I will send some one to-morrow."

"I shall never hear from any of them again. I shall die here in this miserable place. HOPE, my darling little love—my HOPE!" Thus the sick man grew weaker every day, Despair every day gaining power, and hope receding.

XIII.—The Meeting.

IT was a charming morning in June,—one of those mornings so fresh and bright, that even a condemned criminal in a prison cell, could but be glad, looking upon it through his grated window.

"Let's go to the Park," said HOPE.

"To the Park, of all places," replied MAGGIE, "and early, too, before this enchanting freshness is lost."

So the two girls donned their pretty straw hats, and in a twinkling were seated snugly in an Eighth avenue car."

"Do you know, MAGGIE," said HOPE, after an interval of silence, "I think ALFRED is dead?"

"Oh, HOPE!"

"Don't look so sad, dear. I can bear it."

"But what makes you think so, HOPE? I thought nothing could destroy your courage!"

"My courage is not destroyed, MAGGIE. I shall see him again, but not hear. See how lovely the world is after the long, cold winter; so GOD will fill our hearts with sunshine and flowers, after the winter of this life, but not before. I have not given up hoping; I have only put off the reunion time a little."

"I don't believe you are right, HOPE. I think you will be happy in this world; perhaps not very soon, but you are young yet, HOPE—too young to talk in this way."

Through the busy city the slow cars wound their way, and soon the friends were in the open Park, with the sky smiling and serene above them, the soft turf beneath their feet, and verdure and bloom on every side.

"There is a little summer-house down on the border of the lake," said HOPE, "the prettiest place in the Park; let's go there."

So, toward the summer-house they turned their steps, and each absorbed in their own thoughts, did not observe, till close to the little rustic shelter, that it was occupied. A man reclined upon the bench, leaning against the trellised side. Something wonderfully familiar in his form and attitude made the two girls stop and look at this stranger, who had not yet observed them. While they looked, he suddenly arose, as if to leave the place, and, in turning, sharply confronted them.

ALFRED HEATHERSTONE was again face to face with his love!

In the great joy that followed—the joy that was almost too much to bear—MAGGIE was forgotten—for the moment.

"No matter," thought she, pouting a little, "HARRY loves me that same way."

"And I had given you up, as I thought, this very morning," said HOPE, radiant as the June day. "I thought I should never see you again."

"GOD'S ways are not our ways," said ALFRED, tenderly. "The waiting has been long and hard—so long, so hard, but this moment pays for all. MAGGIE, darling, come here; why are you staying there all by yourself? Come and tell me about HARRY. I suppose you have not arrived at the dignity of wifehood yet?"

"Indeed I have, sir. I am Mrs. TRAVERS, at your service."

"Yes, and the demurest, most obedient little wife in America," laughed HOPE, "in spite of all the pretty defiance that used to bother poor HARRY so."

"And now, let's go home," said MAGGIE. "We can tell ALFRED all on our way."

"Let ALFRED tell first," said HOPE, as they stepped into the return car, "how it happens that we have waited so long for his return to New York."

ALFRED explained his sickness, the sending to Virginia, his disappointment at finding the old home deserted, and his arrival in New York only the day before. He had put in all the daily papers an advertisement of his arrival, and was waiting for a clue to the whereabouts of the family.

"I shan't tell you another word now," said he, "but reserve the long story for the grand re-union. It would be too much for a sick man to go over the whole thing twice."

"We must break the news to mother carefully," said MAGGIE, as they approached the house. "ALFRED, you and HOPE wait here while I go to her."

"Why, MAGGIE, what brings you back so soon?" said Mrs. HEATHERSTONE, in a fretful tone. "I thought you went to the Park for the day. How excited you look. What has happened?"

"Nothing unpleasant, dear mamma. Something very pleasant—very joyful."

"Joyful, MAGGIE! No, that can't be. There can be no joy with both my boys dead."

"But, mamma, what if you should find that they are not both dead?"

"What if I should find that we were all back in the old home unchanged? MAGGIE, don't talk nonsense."

"Mamma, I know that ALFRED'S living."

"How do you know it? Tell me."

"Because she has seen me—the best proof in the world, mother, darling," and ALFRED clasped his mother to his heart.

"Now if GEORGE were here, and father," said she, instinctively turning to the light, "we could be happy again."

"Seems to old HANNIBAL," said that personage, suddenly appearing, "dat we got unff to be happy about, widout calling anybody back from de heabenly land. Better let um stay dar, and make de most ob what we hab left. Massa ALFRED, HANNIBAL glad to see you."

ALFRED put his arms round the faithful old negro's neck, and tears streamed down the black cheeks as the young master—master no longer—told him he had remembered him with love through the long separation.

SUSAN'S greeting came next. SUSAN, the same haughty, impassive, beautiful woman that ALFRED had left in Virginia. But why attempt to describe in detail that which is indeed indescribable? NED and HARRY were apprised of the great event, and the happy group, gathered in the June twilight, forgot all regrets in that sweetest of occupations, the recounting of past perils to the sympathetic heart of love.

Of course the inevitable result of that meeting in the park was a marriage. The ceremony was performed at the house of a certain eloquent clergyman whom HOPE loved well, and whose ministrations she had attended since her babyhood. MAGGIE and HARRY were the sole attendants. HANNIBAL fretted a little at not seeing the thing done, but he contented himself with saying:

"What be a ceremony, anyhow, especially when dar be no white dresses and no flowers, and no veils, and nothing. But HANNIBAL spects all dese tings of little 'count compared wid de true love that Massa ALFRED and Miss HOPE hab in their bressed hearts. Dey de LORD'S own 'leeted ones; dat be a fact fixed as dat dar be a LORD. HANNIBAL allus said, out loud, you take courage, Miss HOPE, he come back. But HANNIBAL must 'fess, on dis happy day, dat he had little faith in he own preachments sometimes. Tings looked mighty dark to him down in his heart. Now dis ole black man b'lieves, and he would wish to give his testify to de belief on dis happy day, dat de hearts which love truly, come together one time or anoder, sooner or later. It often be later, but dat all made up in de joy ob de union."

As death and marriage are the end and aim of all heroes and heroines, in stories and out, there is little to say after these supreme consummations have been attained. The simple apartments that MAGGIE fitted up with so much courage and skill, soon became too narrow for the strong hearts of the boys. Inspired by love, they were successful in all their efforts, and in a short time moved into a large and handsome house up town, not far from HOPE'S old home. ALFRED practiced his profession, and HARRY and NED, backed by Mr. ARNOLD'S friends, went into business for themselves. SUSAN still cared for Mrs. HEATHERSTONE'S headaches, and HANNIBAL was, as ever, servant, friend, confidant, consoler. He was so proud of the triumph of the HEATHERSTONES over the adversities of fortune, that he could never say enough about it; and whenever an audience could be found, he would describe the grandeur of the old days, the subsequent tribulations, generally ending with—

"HANNIBAL know it all come right somehow. No more keep dis family down dan a cork. Dey boun to swim on de high tide; dey made to be at de top, and dat is all dere is about it."

NEVER TEACH FALSE MORALITY.—How exquisitely absurd to teach a girl that beauty is of no use! Beauty is of value—her whole prospects and happiness in life may often depend upon a new gown or a becoming bonnet; if she has five grains of common sense, she will find this out. The great thing is to teach her their just value, and that there must be something better under the bonnet then a pretty face, for real happiness. But never sacrifice truth.—*Sydney Smith.*

MEN AND ANGELS.—"When a man dies," says Mahomet, "the people ask, 'What property has he left behind him?' But the angels, as they bend over his grave, inquire. 'What good deeds hast thou sent before thee?'"

Ladies' Port-Folio.

ON THE RIVER.

I LOVE all hardy exercise
That makes one strain and quiver;
And best of all I love and prize
This boating on our river.
I go to row and you to steer,
Gay shall be life's trip, my dear;
You to steer and I to row,
All is bright where'er we go.

We push off from the bank; again
We're free upon the waters;
The happiest of the sons of men,
The fairest of earth's daughters.
And I row, and I row;
The blue floats above us as we go:
And you steer, and you steer,
Framed in gliding wood and water, O my dear.

I pull a long calm mile or two,
Pull slowly, deftly feather:
How sinful *any* work to do
In this Italian weather!
Yet I row, yet I row;
The blue floats above us as we go:
While you steer, while you steer,
Framed in gliding wood and water, O my dear.

Those lovely breadths of lawn that sweep
Adown in still green billows!
And o'er the brim in fountains leap;
Green fountains, weeping willows!
And I row, and I row;
The blue floats above us as we go:
And you steer, and you steer,
Framed in gliding wood and water, O my dear.

We push amongst the flags in flower,
Beneath the branches tender,
And we are in a fairie bower
Of green and golden splendor.
I to row and you to steer,
Gay must be life's trip, my dear;
You to steer and I to row,
All is bright where'er we go.

A secret bower where we can hide
In lustrous shadow lonely;
The crystal floor may lap and glide
To rock our dreaming only.
I to row and you to steer,
Gay must be life's trip, my dear;
You to steer and I to row,
All is bright where'er we go.

[*Fraser's Magazine.*

BEAUTIFYING HOMES.

BY HOPE EVERMORE.

THERE seems to be a prevailing idea with many persons on the frontier, who live in log cabins or other uncouth buildings, that any attempt at beautifying their homes, aside from proper cleanliness, is out of taste—not in keeping with the circumstances. But I beg leave to differ widely, for I have seen such houses made to appear quite attractive—at least, very home-like and cheerful—with the aid of skillful, housewifely fingers, by the addition of pretty vines about the windows and doors, and sometimes almost covering the entire building. The native white Clematis, and "Creeper," also a native of Minnesota, are very pretty for such purposes; the latter especially useful in covering unsightly buildings, as it is a very thrifty grower, and retains its foliage longer here (Minnesota) than in the States further South. The Convolvulus major, or Morning Glory, Cypress vine, Hyacinth bean, Perennial pea, Nasturtium, Madeira vine, Wisteria Jassemine, and Climbing Rose, are very beautiful and useful as climbers, and some of these are generally within the reach of all who would make home the "dearest spot on earth" to its inmates. If we would have it such, let us make it such by the happy arrangement of everything beautiful which we can command. Flowers about our door-yards, and walks, and gardens, more than doubly repay the little time and care we give them; yet these should be arranged in regard to hight and color, or much of their effect is lost.

As it is now cold weather, and the wintry winds have sent us shivering within our homes, let us see how they can be made more inviting internally. "O, but these smoky walls! How *can* they ever be made attractive?" exclaims some troubled housekeeper. Well, first whitewash them, or paper them, if you prefer. But if whitewash nor paper be at hand, and your house be of logs, or ceiled with boards, it may be made to look nicely by pasting newspapers (but be sure you don't use the RURAL NEW-YORKER for this purpose), instead of wall paper, upon the walls. But if the walls be not smooth, three or four thicknesses are required to keep it from cracking, or strips of old calico, or other cloth, may be pasted over the cracks or uneven surfaces, under the paper. This being done, the walls may be ornamented with pictures in rustic or other frames, and brackets of various kinds, upon which may be placed bouquets of everlasting flowers—Helichrysum, Xeranthemum, Gomphrena, dried grasses, &c. Upon brackets may also be placed pots containing plants of twining habit, which may be trained upon the wall, encircling pictures and bouquets, with a very pretty effect. Some of these bouquets may be placed in paper cornucopias, and attached to the wall. Hanging baskets made of old crinoline wire, covered with delicate horn scrapings or small autumn leaves, and filled with flowers of wax, paper or worsted, are very pretty. Rustic frames for pictures can be made of thin, narrow strips of board, and ornamented with pine and spruce cones, plum seeds, peach seeds, acorns and autumn leaves, or shells and cornelians, with which our lakes and rivers abound. And I have seen very pretty frames made of corn, rice, wheat, colored beans, peas, also cloves and other spices; all being nicely varnished when completed.

Ladies of refined taste, living on the frontier, having been accustomed to elegant homes, often find their ingenuity considerably taxed to make their *introductory* abodes seem cozy and home-like. Yet this may be done, to which I can attest, for I have seen very humble homes converted into almost a little Paradise of beauty by deft and willing hands, and with the outlay of a very few cents, aside from the glass needed for pictures. Old Sol's benign face will greatly enhance the beauty of your homes, if you will but bid him welcome. Try the sunshine plan awhile, and see if it does not chase away the gloom of our darkened rooms.

DAUGHTERS OF THE RICH.

No class of women are more to be pitied than the daughters of rich men, who having real force and energy of character, have no vent for it, because fashion requires them to sit still and fold their hands. It does not require this of their brothers. They are applauded when they grow restive under it, and breaking their bonds, interest themselves in a manly way in something besides mere pleasure. But let a daughter try it, and immediately the awful Mrs Grundy starts up, and points to her worsted dogs and cats, and her croquet ground, and her French dressmaker, and bids the daughter of the millionaire still her pulses, and close her eyes and ears to the possibilities, and think of nothing but husband hunting. We never can know how many real heroines are behind this wall of restriction, till what is called "adverse" fate sets them free to stand upon their own feet, and to use their own hands, and know their own powers, which had been dwarfed almost to extinction by inaction.

WOMAN'S POWER FOR GOOD AND EVIL.

ONE gifted and beautiful woman, if wrongly disposed, can work more evil in society, can scatter more seeds of corruption and death, than, with their utmost efforts, a score of men. Her capabilities for good in the different departments of morals are equally great, and in such proportion to her powers, both for good and evil, must be her condemnation, if she is false to her holy stewardship. Society cannot be destroyed if woman is true, nor saved if woman is false. Besides, society shows no unequal discrimination in regard to this particular class of offences. The rule applies to all. A profane woman, a drunken woman, a female thief or murderer excites always a greater horror and disgust than if the crime had been committed by a man. And this is right, and it will be an evil day for this world when woman in her sin excites no more abhorrence than a man.

DOMESTIC HAPPINESS.

THE great end of prudence is to give cheerfulness to those hours which splendor cannot gild, and acclamation cannot exhilarate. Those soft intervals of unbended amusement, in which a man shrinks to his natural dimensions, and throws aside the ornaments and disguises which he feels in privacy to be useless incumbrances, and to lose all effect when they become familiar. To be happy at home, is the ultimate result of all ambition, the end to which every enterprise and labor tends, and of which every desire prompts the execution. It is, indeed, at home that every man must be known by those who would have a just estimate of his virtue or felicity; for smiles and embroidery are alike occasional, and the mind is often dressed for show in painted honor and fictious benevolence.—*Johnson.*

"THERE is but one good wife in this town!" said a clergyman in the course of his sermon—the congregation looked expectant—"and every man thinks he's got her," added the minister.

Reading for the Young.

THE ANT AND THE GRASSHOPPER.

FROM THE FRENCH OF LA FONTAINE.

SUNSHINE will not last,
Summer soon is past—
Then comes the winter weather.

Miss Grasshopper sang her song
All the summer's bright day long,
And forgot the winter weather.

When the snow fell on the ground,
Her leaves, and grain, could not be found—
Then she thought of winter weather.

From her neighbor Ant, in sorrow,
Miss Grasshopper sought to borrow
Food for winter weather.

"Miss Grasshopper," the old Ant said,
"How happens it you're out of bread,
In this cold winter weather?

"What did you in the summer's day,
That you've no victuals stored away,
For this barren winter weather?"

"Do! Why I sang my song, Miss Ant."
"Now Nonce, my friend. Lend? no I can't,
In this cold winter weather."

The Ant family always work—
The Grasshopper's always shirk.
Which fares best in winter weather!

Harrisburg, Pa., 1872. E. C. P.

WISHES.

So Nell, she wants a pony
To ride adown the lane;
And Ned, a gallant vessel
To sail across the main.

Now grandpapa has neither,
But offers each a knee;
And one shall be an Arab steed,
And one a ship at sea.

LETTERS TO YOUNG RURALISTS.—III.

FROM COUSIN JOHNNIE.

I AM glad to see, children, that you keep on writing, even though your letters are not always published. That shows your motto is, "If at first you don't succeed, try, try again." And a capital one it is, too, and one you will need all your lives, and in whatever you undertake. Especially in your endeavors to be good, you must never get discouraged and give up trying, because it is such slow work, but persevere, as we are told, "unto the end." I am so glad ROBERT D. let his owl go when he found the other birds teased it. That shows he is a kind hearted boy. Did you ever hear of an eagle for a pet? I know a little boy who has one. It seems cruel to think of caging such a bird as that, doesn't it? But in this case it was not cruelty, but the very opposite, for the poor thing was found shot through the wing, so that it could not fly, and it was, consequently, nearly starved to death. L. A. L.'s "Tommy" reminds me of a kitten I used to have when a little girl, that would not only let me dress her up in my doll's clothes, but would lie like a baby in my doll's cradle. One day while she was arrayed in dollie's long frock, poor kitty was seized with a fit, and it was so distressing to see her, that my mother thought it best for me, ever afterward, to play with kitty in her own little fur coat. I hope Frank J. D. will remember, in breaking his colts, to use a good deal of sugar, or something else they like, and very little whipping. He must make an aquarium for his goldfish, for they will not thrive in a globe; we have tried it, and lost our pets. I hope MARTHA A. W.'s little calf will grow strong and well. We used to have one which we petted so much, that even when it grew to be a cow it would try to walk into the house. LOU ELLIE M. is really a very smart little girl, to do her baby sister's sewing; and as for CHARLIE M. D., if he is such a worker at ten years of age, what will he be when he is grown up? One thing, certainly—a first-rate farmer. WILLIE W. must remember not to "count his chickens before they are hatched." NELLIE P. needn't feel grieved that she has no pets, while she has a dear little "four-year-old brother." T. L. A. must send us a specimen of his skill in photographing. Now, dear children, good-by for this time.

THE STORY OF A LITTLE WIND-MILL.

A LITTLE boy, who we will call ROBBIE, took a pine stick to his elder brother, who made him a wind-mill. It was a little one, but went very fast. The little fellow was pleased, and played with it a long time, placing it, first, on the gate-post, then marching about with it on his hat, and then he would climb into a maple tree, where he had a seat, and tie it to a limb close to his side.

He was a lonely little boy. His three little sisters had all passed away to that home above, to join the angel band; and when he was in the tree, he fancied he was nearer them, and they could hear the little songs he sang; so he liked this seat among the cool, green boughs, and would sit and study there.

Well, at last he tired of playing with the wind-mill, and then he climbed up a ladder and nailed it to the end of the wood-house, and there it rattled and whirled through the long autumn rains, through the long, cold, winter nights; whirled and rattled on, never once stopping to take breath. No, the more breath it took the faster it went! The children, as they passed, would stop to look at it, for it was such a noisy little thing they could not well forget it was there.

In the spring, when his little adopted sister came to live with him, as they were at play under a large grape vine, which grew on a frame near the wood-house, she saw the little toy, and wished for it very much; so ROBBIE told her if she would wait till there was a ladder there he would get it for her.

Now, the vine had awakened from its long winter nap, spread out its downy leaves in the warm sunshine, and just then came a rustle from the leaves, and the wind swayed a long vine across to the building, and it began to climb. Up it went, to the window where the children had a playhouse, threw a curtain of green, glassy leaves over that, and went on; each day higher and higher, till, by-and-by, one of its strong tendrils clasped the upright part of the little wind-mill, then another, and there it hung. The nails had become rusted by the winter storms, and the strong wind loosened it, but still it rattled and whirled.

One night, there came a heavy storm of wind and rain; in the morning, it was too wet for the little ones to play out doors, so they went into the chamber, when, to their surprise and joy, what should they see but the wind-mill, which had become loosened by the storm, pushed in at the open window, firmly held in the strong grasp of the vine, still nodding and rattling as merry as ever, and saying, as plainly as ever a mill could talk:

"Good morning, little ones; ar'nt you glad I have come?"

The children laughed so merry that the older ones went to look, and then they laughed too, and all laughed together—just about a little wind-mill.—A. R. R.

THE VALLEY ROUTE TO THE PACIFIC.

The Snow Problem.

The four principal routes that have been surveyed to the Pacific, have the following mean elevation above the sea level:—1. The extreme Southern or Texas Pacific route, skirting the border of Mexico, has an average altitude of 2,300 feet. 2. The 35th parallel route, 3,600 feet. 3. The middle route, extending 1,771 miles, from Omaha to Sacramento, 5,000 feet. 4. The Northern route, from Lake Superior and St. Paul to Puget Sound, 1,900 feet.

The middle route (now occupied by the Union and Central Pacific Road) scales four principal summits, having the following elevations: 6,169 feet, 7,042 feet, 7,463 feet, and 8,235 feet. The Northern route has, on its main line, but two summits, the highest of which has an altitude not much exceeding 5,000 feet. Nine hundred continuous miles on the middle route have a greater average elevation than the highest summit on the Northern, and 450 continuous miles on the former line are 1,000 feet above the highest point on the latter.

The remarkably low altitude of the Northern line, fully entitles it to the designation it has received, of the Valley Route to the Pacific. From Lake Superior, for a distance of eight hundred miles, on this line, the country is a vast plain, partly timbered, but mainly prairie, gradually rising from 1,100 feet elevation above the sea, near Lake Superior, to 2,700 feet near the Rocky Mountains. This plain has a varied surface, and in its depressions flow the navigable waters of the Mississippi, the Red, the Upper Missouri and the Yellowstone, and their many tributaries.

Crossing at right-angles the valleys of the Mississippi and the Red River of the North, the northern route traverses the rolling prairies of Dakota to the broad and fertile valleys of the Missouri and Yellowstone. The latter it follows nearly the entire length of Montana to the foot of the mountains. Ascending the eastern slope by an almost imperceptible grade, and surmounting the divide by a pass so remarkable that it almost constitutes a gateway through the mountains, the Northern line enters the valley of a branch of the Columbia, and follows that noble river to tide-water on the Pacific. The leading advantages resulting to the Northern Pacific Railroad from the low altitude of the valley route along which it is building are:—1. A mild climate and a sheltered position. 2. Exemption from deep and drifting snows, and hence, with ordinary precautions, entire freedom from winter obstructions. 3. A productive and verdure-covered country flanking the road, resulting in rapid settlement, a large tributary population, and a profitable local traffic. 4. An abundance of good water. 5. A saving of many millions in cost of construction, with a proportionate reduction of interest burden. 6. A succession of natural and easy grades, which will greatly reduce the cost of operating the road, and enable the same motive power to accomplish far greater results, both in speed and traffic, than are possible on an elevated or mountain route.

The experience of the past winter, the severest since our territories were settled, and not likely to be repeated for many years, has thoroughly justified the claim that the Northern Pacific Road, when completed, will not be at any time obstructed by snow. Authentic reports—official, unofficial and incidental, from surveyors, engineers, United States military and signal officers, and settlers, representing all important sections of the route—agree that during the past hard winter there has not been a time when, with the precautions usually taken on roads in Northern States, Northern Pacific trains could not have made regular trips.

Chief-Engineer Roberts of the Northern Pacific Road, who has no superior in his profession in this country, and has carefully studied the Western snow problem during the past three years, in a recent report, based on very full data, sums up his conclusions in this sentence:

"With ordinary means of protection at exposed points, the Northern Pacific Railroad, when completed by the Yellowstone route, can, unquestionably, be kept open for regular traffic its entire length across the Continent, even during winters as severe as the present, should they occur."

He further says, alluding to a mass of testimony from Montana:

"These very favorable reports, during a winter of unprecedented severity, cover the most elevated and mountainous portion of our line, where obstructions from snow would occur, if anywhere on the route; and, when it is remembered that the obstructions on the Union Pacific have been virtually confined to a section of 180 miles, every part of which is at least 1,000 feet higher than the highest summit on the Northern route, and most of which is 2,500 to 3,000 feet higher than the mountain section of equal length on the Northern Pacific line, it becomes perfectly safe to predict for the latter as complete exemption from winter blockade as is enjoyed by railroads in New York and New England."

Intelligent judges believe that the Union Pacific Company, taught by experience, will be able hereafter to prevent any serious blockade on their line. Whether this shall prove true or not, it can be considered settled that the Northern Pacific Road, following, as it will, the channel-way of the great rivers of the Continent, traversing the mild-winter belt and running at an elevation 2,500 to 3,500 feet lower than its neighbor, will, from the day of its completion, furnish a reliable means of transit between the Atlantic and the Pacific. It is particularly and vastly important that this fact be known and emphasised, now that we have among us an important embassy from Japan, whose report on the efficiency of our trans-continental thoroughfares will do much to hasten or retard the increase of our direct trade with the Orient.

The past year's business on the Union and Central line, with its promise of rapid increase, establishes, beyond doubt, the success of the first trans-continental road; but it renders equally certain the profitableness of the Northern Pacific, which has radical advantages, with an ample field and future of its own. The two lines are so far apart as not to interfere with each other. As is the case with the present Pacific Road, the bulk of the earnings of each will doubtless come from local traffic; while the Asiatic and through carrying trade of both will be increased to an enormous volume by their joint efforts to turn the current of the world's commerce across the American Continent, and by their joint demonstration that the trans-continental route is equal to all commercial needs.—*Independent.*

Facts for the Ladies.—Dr. A. K. Gardner of New York says there is not the slightest foundation for the vague and interested statements that the light Wheeler & Wilson Lock Stitch Sewing Machine is injurious to feminine health. We speak advisedly when we deny most positively that any form of disease is traceable to its proper use by any woman in health. For twenty years we have carefully watched the progress of the Sewing Machine, visited the large factories where it is used by the hundred, questioned the makers, the foremen in the workshops, the girls daily working them, and never yet have been able to trace a single disease as having originated from the use of this domestic implement. See the new Improvements and Woods' Lock-Stitch Ripper.

Special Fertilizer.—We notice that Mr. Geo. E. White of 160 Front St., New York, the well-known importer of German Potash, Phosphatic Guanos, and the *Soluble Pacific Guano*, is pressing upon the public the claims of the Soluble Pacific to be considered the best general fertilizer without exception, having the exact and properly balanced proportions of ammonia, soluble phosphoric acid and potash, that is required for nearly all crops, while it is, from the presence of the potash, specially adapted to potatoes, clover and tobacco. Nearly all our light loams and sandy soils are greatly benefited by the application of a fertilizer with just these constituents, and we may safely recommend it for such land.—*Ex.*

The Grand Revolution in Medical Treatment, which was commenced in 1860, is still in progress. Nothing can stop it, for it is founded on the principle, now universally acknowledged, that physical vigor is the most formidable antagonist of all human ailments, and experience has shown that Plantation Bitters is a perfect invigorant, as well as the best possible safeguard against epidemic diseases.

Watch No. 2291, Stem Winder—bearing Trade Mark "Fayette Stratton, Marion, N. J."—manufactured by United States Watch Co., (Giles, Wales & Co.,) has been carried by me eighteen months; its total variation from mean time five seconds per month.—E. O. WHIPPLE, Con. U. & B. R. R.

Civil Service Reform is the cry of politicians. No more traveling agents whose support doubles prices is our reform. THE JONES SCALE WORKS, Binghamton, N. Y.

It will pay you to send to Porter Blanchard's Sons, Concord, N. H., or to any dealer in *first-class* dairy machinery, for the circulars of their excellent churn.

SPECIAL NOTICES.

RUPTURE CAN BE CURED

without suffering. ELASTIC TRUSSES are superseding all others. Before buying Metal Trusses or Supporters, send for a descriptive circular to the ELASTIC TRUSS CO., No. 683 Broadway, New York.

THE MARKETS.

MONEY AND TRADE AFFAIRS.

NEW YORK, Saturday, March 23, 1872.

GENERAL trade has been moderately active in Imported Merchandise since our last report, and also in Domestic Cotton Goods, but the export movement is dull, and at this port as well as those South, the clearances of cotton, so that domestic produce for foreign markets is falling behind last season. The exchanges, however, keep below the gold shipping point, and gold itself is ⅛@⅜ lower than last week on account of a large supply of Bills on London made against very extensive purchases of Erie Stock for foreign account. The course of this stock has again been the feature of the Stock Exchange and Wall Street. The price was run up to 52 per cent. on orders from abroad, and the supply of the stock on the market has been considerably reduced, and the amount left in this country of the common capital of the road is supposed to be less than one-fifth of the whole, if so much. Some estimates place it at 100,000 shares out of 780,000.

Money keeps pretty close, and the Stock Market, with the exception of Erie, is barely sustained at last week's figures.

The following are the comparative movements of the City Banks for the past fortnight

	March 16.	March 23.

PRODUCE AND PROVISIONS.

NEW YORK, Friday, March, 22, 1872.

Receipts.—The receipts of the principal kinds of produce since our last embrace 13,678 bales of cotton, 201 pkgs. dried fruits, 15,129 bbls. eggs, 36,333 bbls. flour, 19,530 bush. wheat, 223,650 bu. corn, 62,655 bu. oats, 21,900 do. barley, 3,086 sacks grass seed, 515 bbls. beans, 231 bags do., 262 bales hops, 4,251 pkgs. pork, 1,019 pkgs. beef, 14,118 pkgs. cut meats, 10,364 pkgs. lard, 7,319 pkgs. butter, 6,572 pkgs. cheese, 1,558 bags peanuts, 950 hhds. tobacco, 8,256 boxes do., 4,001 bbls. whisky, 830 bales wool.

Butter.—The market is active and higher, and everything will be closed up clean beyond question. It is again time for the annual, but too much unheeded objection, to fictitiously colored new butter. Much of what is hurried in at this season, at the best, is dubbed "hog grease," and the strong tint that is apt to be inartistically supplied, fails to delude purchasers.

State dairies, fine, 33@35c.; State dairies, fair to good, 29@32c.; State, half-tubs, good to fine, 36@38c.; State, do., common to fair, 28@32c.; State, firkins, fine yellow, 31@33c.; State Welsh, good dairies, 31@33c.; State do., common to fair, 25@30c.; State do., fresh made, 34@37c.; State, fancy select tubs, 38@42c.; rolls, good Western, 21@23c.; common to fair, 12@18c.; grease butter, 9¾@10c. New white butter, 33@38c.

Beans and Peas.—The arrivals of beans have been small, and with a good home trade, prices are very strong, especially for mediums. Kidney, prime, $3.25@3..5; do. good, $2.60@3.15; do. red, good to prime, $2@2.50, mediums, prime, $2.75; do. good, $2.45@2.70;

do. common to fair, $1,95@2.10; Marrowfats, prime, $3 @3.10; do. good, $2.90@3.00; do. common to fair, $2.30@ 2.50; pea, prime, $2.85@3; do. good, $2.40@2.60. Peas sell at $1.24@1.25 for Canada, free, in bbls., and $1.90@2 for green, and $3 for Southern blackeyed, per 2 bushel bag.

Beeswax—Is scarce and higher. Sales at 36½@37c. for Southern.

Broom Corn—Is offered freely at weak figures. New hurl, 7@8c.; new green, 5c.; new red, 3@5c.; old at 3@6c.

Cheese.—The features of the market are much the same. No further changes in prices have occurred, but holders remain confident. The home trade are the only purchasers, as the foreign quotations are much below the market. The high prices are calling in the surplus stock held back in the interior, but this supply has been discounted. No new cheese has been received, but a few small lots are expected early next week. Holders expect to clear out the old stock at present prices, but there is not much animation in the market, consumers buying only as they have occasion to use.

Quotations are: Fine State factory, 20c.; good do., 18@ 19c.; ordinary, 14@16c.; State farm dairy, prime, 17@19c; Vermont factory, 18@19c.; Ohio factory, good to fine, 17@18½c.; English dairy, 16@17c.; pineapple, State, 17@19c.

Cotton.—There has been a very quiet market for prompt delivery, and a weak feeling. Exporters buy sparingly.

	Uplands.	Alabama.	N. Orleans.	Texas.
Ordinary	19¾	19¾	20	20¼
Good Ordinary	21¾	21¾	21¾	21¾
Low Middling	21¾	22	22¾	22¾
Middling	22¾	22¾	22¾	23¾
Good Middling	23¾	23¾	23¾	23¾

For forward delivery latest sales on the basis of low middling are as follows:—April, 22c.; May, 23¾c.; June, 23¾c.; Aug., 22¾c.; Sept., 21c.

Dried Fruits.—Apples firm and tending higher. Unpeeled peaches saleable at full figures; peeled, quiet. Blackberries favor buyer.

Apples—Old State, qrs., 7@8c.; Western, new, 8@9c.; Southern, new, qrs., 7½@8c.; do. fine, sliced, 10@12c.; new State qrs., 9½@10c.; do. sliced, fine, 13@14c. Peaches, peeled, new N. C., 17@18½c.; do. Geo., 15@16¾c.; peeled E. Sh. Va., 13@16½c.; new unpeeled halves, 7¾ @8c.; do. quarters, 4½@5c. Plums, 25@27c. Cherries, new, ₱ lb., 30c. Blackberries, 13¾c. Raspberries 28@30c.

Eggs.—Prices were as low as 21c. early in the week, but the cold snap creates reaction. There is some speculative inquiry. Sales at the close at 24@25c., but there is considerable disposition to realize at these figures.

Fresh Fruits.—Choice apples bring high prices, with a light stock. Common fruit plenty and weak. Cranberries sell at full prices. We quote:

Apples, good, barrels, $3.75@4; do. selections, $4.25; do. poor, $2.75@3; cranberries, fine, bbl., $14.00; do. crates, fine, $4; do. do. common, $3@3.12; oranges, La., bbl., $14@15; peanuts, Wilmington, bush., $2@2.25; Virginia, new, $2@2.20; do. common, $1.25@1.50; hickory nuts, $1.75@2; Pecan nuts, ₱ lb@9½c.

Flour.—The low prices have induced some speculative inquiry, and an increased trade for home use, and there is a stronger feeling. There is scarcely any foreign demand.

The quotations are at $6.00@6.30 for superfine State; $6.35@6.80 for common extra do.; $6.35@6.35 for good to choice do.; $7.00@7.30 for fancy do.; $6.00@6.30 for superfine Michigan, Indiana, Ohio, Iowa, &c.; $6.50 @6.80 for extra do.; $6.85@7.50 for choice extra do., including shipping brands of round hoop Ohio at $6.75 @7.00, and trade brands of do. at $7.05@7.75; good to choice white wheat extras at $7.50@7.80; Minnesota, fair to very choice extra, at $7.00@8.00; St. Louis at $6.80@7.50 for common to fair extra, and $7.55@9.50 for good to choice. Southern at $6.75@7.85 for extras and $7.90@9.50 for good to choice. Rye at $4.10@5.05.

Grain.—For wheat there is a strong market, in sympathy with foreign reports, but there is not much trade. No. 2 spring in store, $1.52@1.53, No. 1 do., $1.57@1.59, winter red Western, $1.66@1.70, amber do., $1.72@1.74, white Western, $1.75@1.78. Rye is quiet at 88@89c. for Western. Oats are active in part on speculation, and prices are higher. Sales at 51½@55c. for Western, 55@58c. for white Ohio, and 56c. for State. Barley is entirely nominal. Western malt sold at $1.60. Corn is higher, with an increased export trade. Sales at 71c. for new Western mixed and Southern yellow.

Hay and Straw.—The stock of hay is very light, and, with a few orders from shippers, prices have advanced (temporarily) to $1.35@1.40 for shipping. Prime qualities, $1.35@1.70. Long rye straw sells at $1.05@1.10.

Hops.—The arrivals are very light, and, with a fair trade from brewers, the market is very strong.

New Yorks, growth 1871, 25@65c.; Eastern do. 1871, 2@ 60c.; Western do. 1871, 25@30c.; yearlings do. 1870, 10@ 30c.; olds do. 1869, 10@15c.; old olds do. 1868, 8@12c.; Californians do. 1870, 15@25c.; Californians do. 1869, 9@15c.; Bavarians, 65@75c.; English, 60@65c.; Belgians (nominal), 50@55c.

Poultry and Game.—The arrivals have not been sufficient to meet ordinary wants of consumers, and prices are higher. Wild pigeons arrive regularly, and are declining.

Turkeys, Western, good, 20@22c.; do. State, 22@23c.; do. Jersey, 24@25c.; Ducks, Western, 20@22c. Fowls and Chickens—Western good, 19@21c.; do. State, 21@ 22c.; do. Bucks Co. and N. J., 21@23c.; capons, 30@32c. Ducks, Western, 20@22c.; do. State and N. J., 25@28c. Live, State and N. J., 18@20c. do. Western, 18@23c.; roosters, 13c.; ducks, per pair, $1.50. Geese—Western, $1.50@1.75; do. Canada, $1.75@2; do. Jersey, $3@3.50; turkeys, 20@22c.

Game.—Rabbits per pair, 35@45c.; hare do., 40@50c.; canvas backs $3, red head $1.25, mallard $1, widgeon and teal 50@60c.; Black duck, 75c.; English snipe per doz., $4; squab per doz., $1; wild geese each $1.; wild pigeons, per doz., $2.

Provisions.—The market for pork has been depressed. Sales as low as $12.65, but with full parcels sold, the quotation is entirely nominal. Small lots are selling at $13. Sales for March at $12.85, for April at $13. Extra prime, $11.50; Western prime mess $13. Dressed hogs are steadily held at 5¾@5¾c. for Western, and 6@6¼c for city. Middles are offered freely at lower prices. Sales at 6c. for Cumberland; 6½c. for short rib; 7c. for long and short clear. Cut meats selling in lots at 8½@9¼c. for hams in pickle; 8¾@9c. for do. in salt; 5@5¼c. for shoulders. Smoked meats at 10@13c. for hams; 6¾@7c. for shoulders; 7¾@8¼c. for clear rib. Lard has been weak under large receipts. Western steam, 9¼c.; for April, 9¼c.; for May, 9½c.; for June, 9¾c. City at 8¾c. for No. 1. Beef is dull, at $8@10 for plain Western mess; $10@12 for extra mess. Tierce beef at $15@17 for prime mess, and $19@21 for India mess. Tallow is weak, at 9@9½c. for prime.

Seed.—The arrivals of clover have been small, and prices steadily held. The demand is almost wholly from the home trade. Sales at 8¾c. for Ohio, and 9¾ @9¾c. for prime Indiana. Timothy is dull at $3@3.25.

Tobacco.—A good business has been done in Kentucky leaf, and there is a very steady feeling. Lugs quoted at 7¾@8¼c.; common to medium leaf, 8¾@10c., and selections up to 15c. Seedleaf has been sold more freely at full figures. Conn. and Mass. wrappers, 25@ 40c.; selected do., 45@55c.; fillers, 15@16c.; Ohio assorted, 16@25c.; do. wrappers, 30@40c.; Pa. and Ohio fillers, 12@15c. Havana has been taken to a large extent, at satisfactory prices; fillers, common, 85@87½c., gold; do. fair, 90@97½c.; do. fine, $1@1.10, gold.

Vegetables.—Potatoes have been coming in freely, and are lower, especially for Peach Blows. There is a fair receipt of Bermuda tomatoes; they sell at $1 per box.

Potatoes, Early Rose, bbl., $2.00@2.50; P. Blows, $2.25 @2.75; Prince Albert, $1.75@2; Monitor and Goodrich, $1.25@1.50; Jackson, $1.50@1.75; Dyright, $1.50@2; Nova Scotia, $1,75; sweet Del., $3.75@4.00. Onions, red and yellow, $1.50; white, $2.50@3; Coun., 100 strings, $2.50 @3. Garlic, per 100 bunches, $20@22. Turnips, Russia, bbl., $2. Cabbages, per 100, $6@8. Hubbard squash, per bbl., $5; marrow, $5. Beets per 100, $1,25. Carrots per 100, $1.50.

Wool.—Fleeces are offered sparingly, and only at very full rates. Manufacturers consider prices as high as they will go, and buy only as they have occasion to use. Texas and California stock sells slowly. Foreign are held firmly, with a moderate business. Latest sales are at 52½c. for unwashed fleeces; 80c. for extra pulled; 80c. for super pulled; 35@35½ for slightly burry fall clip California; 60c. for Noils; 55c. for East India; 47½@49c. for Cape.

Whisky.—Prices have declined, but at current quotations there is more business. Western, 87@87½c.

Furs and Skins.—The market feels the advance abroad, and extreme prices are realized for all grades of skins that even approach good quality. We quote currency prices:

	Northern and Eastern. No. 1.	Wost'rn. No. 1.	South'rn. No. 1.
Beaver, dark, p'r pce.	$1.00@ 4.00	$ 50@$2.00	$ 25@$1.00

LIVE STOCK MARKETS.

New York, March 22, 1872.

Cold weather still continues, causing a good demand for all kinds of meats, and keeping back fresh fish, eggs, &c., which would go for substitutes. Cattle and sheep have fallen off largely in numbers, and the latter, especially, are not in sufficient supply to meet the wants of butchers. The feeling at the close is scarcely as firm. Hogs continue to come forward freely, and are weaker. Packers have nearly closed their operations for the season, and there is a large stock of hog products on the market.

Beeves.—The severely cold weather favors trade. The cattle offerings last Monday were 99 car loads at Communipaw, 34 cars at 100th street, and 42 cars at Weehawken. There were several lots of extra fine cattle among them. One car was superior in quality to anything we have had since the holidays, weighing 1,300 lbs. each, alive, the best selling at 14c., 62 lbs. per cwt. Still, 13c. was fairly the top of the market for fat cattle, the pick of several lots reaching 13½c., when owners permitted selecting. Since Monday, the arrivals have amounted to 2,378 cattle, or rather more than could be sold readily at full rates. A few were left over last night. Save some Quills at 5@5¾c. ₱ lb., live weight, and dry cows at about 10c., the 11@11½c. Cherokees were the lowest grade, and they were not very poor. One lot of 82 fair, 6¾ cwt. Ill. steers was sold at 12c.; 3 cars 8 cwt., 13c.; 4 cars Cherokees, 1,050 lbs, 11¾c., 57 lbs ₱ cwt., and 3 cars Mo. cattle, 8 cwt., $100 each.

The following are the closing prices for the week, in comparison with what cattle brought one week ago, for net weight of beef:

	This week. Cents.	Last week. Cents.
Choice beeves, ₱ lb	13 @ 13¼	13 @ 13¼
Good to prime	12 @ 12½	12 @ 12½
Ordinary to medium	11 @ 11¾	11 @ 11¾
Lowest grade	10 @ 11	10 @ 11
Average sales	11¾ @ —	11½ @ 11¾

Milch Cows.—Dealers in fresh cows had such a hard time of it one week ago that they are acting more cautiously now, bringing in fewer animals; and still the market is overstocked, especially with ordinary and poor cows. It is strange that farmers will send in, or dealers buy, such miserable trash as some of the apologies for cows now upon this market, and for which $25 would be a big price. These poor cows injure our markets more than anything else. The few good milkers and springers sell at $75@80, but this kind is very scarce. The majority sell at $40@60, with a surplus on hand.

Veal Calves.—Receipts are increasing both of live and dead calves. Cold weather has been a fine thing for the dealers, enabling them to hold the hog-dressed veals a whole week, if not sooner sold. The great bulk of the calves come in dressed, some of them from the Western States, and mostly sell at 8@10c. per lb., being thin. Good ones are worth 12@13c., with none fairly quotable above that. The poorest sell at 6@7c. Live vary from 5@8c. for poor, up to 9@10c. for fair to fine, one lot of 180, prime Bucks Co., 140 lbs., averaging 10c., with 51 of 122 lbs. at 9c.

Sheep.—Receipts have been light during the past week, and trade continues good, the high rates of past weeks being fully sustained, viz:—10@10¼c. for prime to extra fat, 9@9¼c. for ordinary to fair, and 8@8½c. for poor. One lot of very ordinary 68 lbs. Virginia sheep sold at 8¼c. Two cars 69 lbs. Ohio sheep were sold at 9¼c.; 3 cars of 95 lbs. at 9¾c.; 2 cars, same weight, at 10c.; 2 cars choice, 111 lbs., at 10¼c. There were 7,26[illegible] sheep sold during the week, very many of them of extra quality, averaging $9.91 per head, with 1,915 only medium, at $7.71 each.

Hogs.—These continue to arrive freely, quite in excess of last week's supply. There were 5,584 Western dressed hogs received during the past week. The market is inactive, and prices lower, live ruling from 4¾c. to 5¼c. when anything is sold. City-dressed are selling at 5¾@6¾c. as extremes, most weights going at 6¼@6¾c. Western-dressed are dull, at 5¾@5¾c. The hog season, so far as packers are concerned, is drawing towards a close.

AGENTS WANTED

Address F. P. Follett, 3 Asylum St., Hartford, Ct.

"FAMILY FAVORITE!"
THE
WEED. WEED
The most perfect, reliable and generally useful machine in existence. For the family of the farmer or mechanic, where the work required of a sewing machine ranges from the heaviest garments of men's wear to the most delicate and ornamental fabrics for ladies and children, it has proved itself thoroughly efficient and entirely satisfactory. Of unequaled simplicity and compactness of construction, capable of being learned and operated with one-fourth the usual expenditure of time and labor, with a capacity for quantity, quality and variety of execution beyond its competitors, and a reputation for durability and reliability known and appreciated by thousands, it is offered to the people for the most critical inspection and comparison, with confidence that its obvious merits cannot fail to convince the careful examiner of its superiority. Manufactured by the
WEED SEWING MACHINE CO.,
HARTFORD, CONN.
REPRESENTED IN ALL THE PRINCIPAL CITIES AND TOWNS.

CAMPBELL'S Late Rose Potato.—A new Seedling from Early Rose, of wonderful productiveness and finest quality. Will yield twice as much as any other potato. *Three bush.* were grown from half a pound the past season. Circulars free. Price, $1 per lb., or $3 for 4 lbs. GEO. W. CAMPBELL, Delaware, O.

RIVERVIEW Military Academy, Poughkepsie, N. Y. A thorough-going school for boys.

TO FARMERS.—DOUBLE REFINED POUDRETTE of the "LODI MANUFACTURING CO," for sale in lots to suit customers. This article is sold for *half the price* of other fertilizers, and is cheaper for tobacco, cotton, corn and vegetables than any other in market. It is made entirely from the night soil, offal, &c., of New York city. Price, delivered on board in New York city, Twenty-five Dollars per ton. I ask attention to the following Testimonials:

Oneida Co., N. Y., Oct. 12th, 1871.—*Dear Sir:* For two years past I have used the Double Refined Poudrette for corn, potatoes and garden Vegetables, and I have realized on the first crop 100 per cent. for all the money invested. Yours truly, T. B. ALLANSON.

Windham Co., Vt., Dec. 4th, 1871.—*Dear Sir:* I think the Lodi Company's Double Refined Poudrette the best manure I can find for tobacco, corn and potatoes. I shall order a number of tons another season. Yours respectfully, E. S. HORTON.

Jesse Vaughn of Lancaster, N. Y., under date of September 20th, says:—I applied the Double Refined Poudrette, last Spring, on corn and potatoes, and I believe I have the best corn in town, and my potatoes are an excellent crop. I have used your Double Refined Poudrette several times before, and always with good results, but this year the effect has been more perceptible than ever before.

A pamphlet giving full directions, &c., sent on application to JAMES T. FOSTER, 66 Cortlandt St., N. Y.

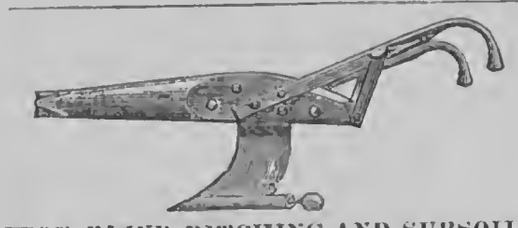
CARHART'S
PATENT TWO-HORSE
Pulverizing Cultivator

Was Awarded the First Premium at State and County Fairs in 1870 and '71.

It is superior to the best Wheel Cultivator.
The price is only Twenty Dollars.
The draft is reduced nearly one-half.
The depth you wish it to run is regulated without the use of wheels.
It can be drawn close to a tree or plant without injuring it.
It is not disturbed by short undulations of earth, like the Wheel Cultivator, but pulverizes, levels and fits the ground for the Mowing Machine better than any Cultivator in use, and can be used for more purposes than any other implement on the farm.

C. C. BRADLEY & SON, Man'frs, Syracuse, N. Y.



FOR BLIND DITCHING AND SUBSOILING.—Makes a ditch as fast as the team can travel. Will ditch meadows without injury to the sod, and add from one-fourth to one-half to the production of crops. Address
GEO. CHAMBERLIN & SON, Olean, N. Y.

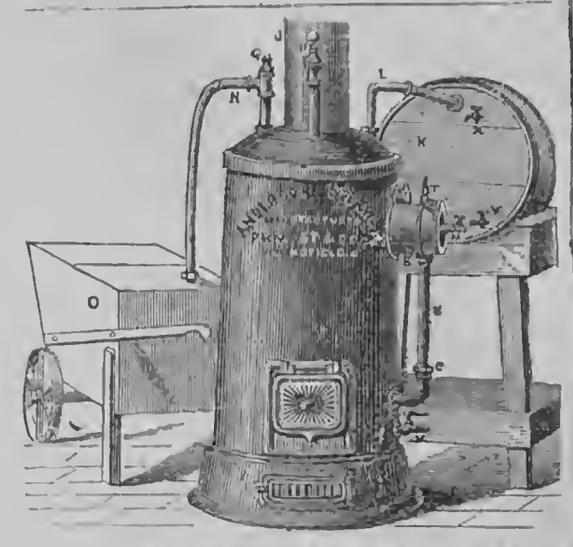
Sold by Dealers.

For level land and side hill, do perfect work *without dead furrows or ridges.* Easy draft. Have Hinged Cutters.

Send for Circular. **F. F. HOLBROOK & CO., Boston, Mass.**



ANDERSON'S AGRICULTURAL STEAMER, for *Steaming* FEED FOR STOCK Heating Cheese Vats; Tannery Vats, Conservatories, &c. This Steamer is made of Wrought Iron, thoroughly riveted and finished in good style. It has a reliable Automatic or Self-regulating Water Feeder, Safety Valve, Vacuum Valve, Water Gauge Cocks, Whistle, &c., all complete. The boiler is peculiar in construction, being ONE COMPLETE DOUBLE BOILER WITHIN ANOTHER, the two communicating one with the other. It has an extraordinary amount of fire space for the size of the boiler; No. 3, a medium size, having 3,853 square inches of fire surface; consequently, it requires but little fuel to run it. Either wood or coal may be used for fuel.

It will cook more feed, or heat more water, in a given time, than any other Steamer of the same size or cost. It is more durable than any other, for the reason that the fire-box is made of wrought iron, and is *entirely surrounded with water.* We are also manufacturing:

Anderson's Low Pressure Steam Heater, for Heating *Private Dwellings, Stores, Churches, Conservatories, &c.* We manufacture for all the territory east of Illinois.

For further particulars address
P. P. MAST & CO., Springfield, Ohio.

FARMERS, DAIRYMEN AND BUTTER BUYERS!
PACK YOUR BUTTER
IN
WESTCOTT'S
RETURN BUTTER PAIL

Approved and recommended by the leading authorities of our country on dairying, and acknowledged by all butter dealers to be the very best package in use.
Butter packed in this Pail brings **5 to 10 cents more** a pound in the New York City market than the same quality in any other package.

READ THIS:

NEW YORK, Nov. 15, 1871.

We, the undersigned, Produce Commission Merchants of the City of New York, consider Westcott's Return Butter Pail, manufactured by Silsby Bros., Belmont, N. Y., *the best package in the market.* It is our experience that Butter packed in this Pail *sells more readily and commands a higher price* in this market than in any other package, and we heartily recommends its general use by the dealers, dairymen and butter buyers who ship to this city.

Respectfully,

(Signed by 45 leading Commission Merchants.)

The Westcott Return Butter Pail meets my approval as a good butter package. It is one which I always feel safe in recommending.
X. A. WILLARD,
Dairy Editor Moore's Rural New-Yorker.

Dairymen, send for a Circular! Dealers, send for a Price List! We are the sole manufacturers of **Westcott's Return Butter Pail,** and also manufacture very extensively Butter Firkins, Half-Firkin Tubs, 25-pound Butter Pails, Well Buckets, &c., &c.

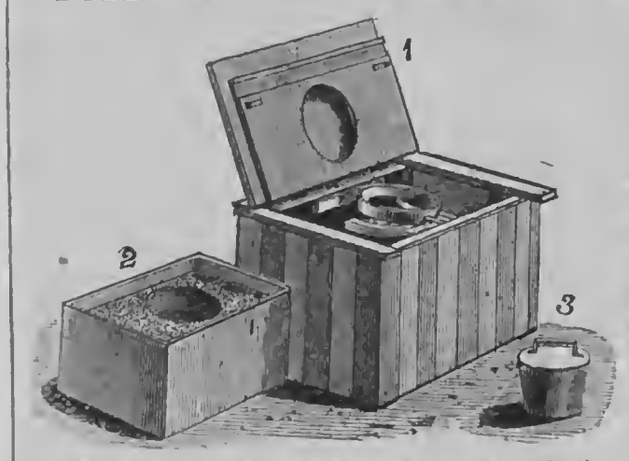
PUBLIC HEALTH PROMOTED! AGRICULTURE BENEFITED!
GOUX'S
PATENT ABSORBENT CLOSET & URINAL.



"The Goux system possesses all the advantages of the dry earth system without its disadvantages; it is economical, deodorizing and self-acting. The whole refuse of every house, its excreta, liquid or solid, ashes and sweepings, are disposed of and turned to account, and it is applicable in individual cases, dwellings, and in large communities. The alterations to the ordinary closets, to adapt them to the dry system, are less costly in the Goux process than in any other, and it is applicable to the best description of houses, as well as to the dwellings of the poor."—*Scientific American, Jan. 1, 1872.*

MARION
UNITED STATES WATCH CO'S WATCHES.
REPORT OF JUDGES
TO THE GENERAL COMMITTEE
CINCINNATI INDUSTRIAL EXPOSITION:

GENTLEMEN—The Judges appointed to examine into the merits of the articles contained in Class 10, beg leave to make the following report:

No. 1650. United States Watch Company, Marion, New Jersey. These watch movements, the result of American capital, skill and perseverance as specimens of this branch of science and manufacture, rival those of European make. The watches exhibited by this Company are of all grades, from that of the most exact timekeeper, to the cheaper kind for the million. All are excellent of the kind, and are too well known and appreciated by the people to need further comment. First Premium is awarded to the United States Watch Company.

E. S. Higgins
James Powell
William M. Davis } Judges

Price Lists furnished the Trade on application, inclosing business card. For sale by the Trade generally.

Ask your Jeweler to see the MARION

WATCHES.

BEWARE of worthless imitations with which the country is flooded. To avoid imposition, see that the words MARION, N. J., are engraved on the plate over the Main-Spring Barrel. All others are spurious.

Paints, Oils, Blacking, &c.

ARE YOU GOING TO PAINT?
MORE THAN
100,000 HOUSES
HAVE BEEN PAINTED WITH THE
AVERILL CHEMICAL PAINT
IT IS THE BEST

In the world for exterior work upon Cottages, Villas or Buildings of any kind, whether built of brick, wood or iron. It is a liquid, *ready for use,* and requires no oil thinning or drier. Purest white, and any desired shade can be had in packages from one gallon upwards.

Letter Received from Levi Shaw, Trustee of the United Society of Shakers.
MT. LEBANON, N. Y., Sept. 27, 1871.

RESPECTED FRIENDS:—In reply to your inquiry as to what we think of the Averill Chemical Paint, we have used in our Society at Mount Lebanon some 1,000 gallons. We are very much pleased with it, and until we are convinced that there is something better, shall give it the preference of all other paints. We have used heretofore the (— l, (—), and most all other brands of white lead, neither of which have given us perfect satisfaction. Most of it would chalk off after being on some two or three years. This, after three years' experience, we do not find to be the case with the Averill Pure White Chemical Paint. Indeed, it appears just as well as when first put on. I will write you again on the subject when I am not in quite so much of a hurry.

Sample card of beautiful colors, and recommendations from owners of the finest residences in the country, furnished free by the
AVERILL CHEMICAL PAINT CO., 32 Burling Slip, New York, or 118 Superior St., Cleveland, Ohio.

P. S. The superiority of these Paints has already brought numerous *worthless* imitations in the market. We caution the public against using them.

Knitting and Sewing Machines.

NEEDLES FOR ALL SEWING MACHINES can be obtained at about one-half the usual rates by ordering direct. Singer's, 40 cents per doz.; Wheeler & Wilson, 60 cts.; Howe's, 50 cts.; Grover & Baker, 50 cts., and others in proportion. Inclose the amount and Needles will be returned by first mail. Address
EAGLE NEEDLE CO., Watertown, N. Y.

MILLER & COATES, 279 Pearl St., New York.

The Nursery Favorite Safety Pin.
PATENTED 29th AUGUST, 1871.
BEAUTY, ECONOMY, UTILITY, SAFETY.
THE BEST AND MOST PERFECT PIN EVER MADE.
It takes 22 Inches of Wire to Construct One Pin.
IT OVERCOMES OBJECTIONS constantly made by those using other pins. Unlike them the wire is formed into a long and short spiral coil. The pin is pointed at the end and is of a triangular shape, which will allow it easily to penetrate one or more thicknesses of cloth. When confined, the sharp point is perfectly inclosed and secure, and cannot become loosened except by hand manipulation
THEY GIVE PERFECT SATISFACTION.

Liberal inducements offered to the Trade. Local and Traveling Agents wanted everywhere. One-half dozen pins packed in a neat little box and sent post-paid to any address on receipt of FIFTY CENTS.
DOOLITTLE M'F'G CO., 539 Broadway, N. Y.

MAGIC PHOTOGRAPHS.—The Wonders of the World. 25c. a package. 5 assorted packages for $1. Send to W. C. WEMYSS, 730 Broadway, N. Y.

MUNICIPAL BONDS
10 TO 12 PER CENT. INTEREST.
SAFETY AND PROFIT COMBINED.

States may repudiate, but Counties, Cities and Towns cannot.

We have at all times **Good Municipal Bonds** for sale at the lowest market rates.

SEND FOR DESCRIPTIVE PRICE LIST AND PAMPHLETS.

W. N. COLER & CO.,
No. 11 Wall St., New York.

"BEST" THRESHING MACHINES and Clover Machines. G. WESTINGHOUSE & Co., Schenectady, N. Y. ☞ Circulars sent.

BUY THE
Iron Clad Milk Can

The only one ever manufactured that will stand the hard usage to which they are subjected. For sale by all can makers. Stock and Trimmings for sale only by the IRON CLAD CAN CO., Send for Circulars. 51 Dey St., New York. ☞ All genuine are stamped I. C. C. Co.

FIRST PREMIUM (MEDAL) AWARDED IN 1870, AND INDORSED BY CERTIFICATE FROM THE AMERICAN INSTITUTE IN 1871, AS
"THE BEST ARTICLE IN THE MARKET."

The "**Asbestos Roofing**" is a substantial and reliable material, which can be safely used in place of Tin, Slate, etc., on steep or flat roofs, in all climates. It is finished on the roof with the "**Asbestos Roof Coating**," prepared ready for use. (Also valuable for restoring old Tin, Shingle and other roofs.) It is proof against burning sparks and cinders, and can be easily and cheaply transported and applied.

Also, manufacturer of ASBESTOS BOILER FELTING, Roofing and Sheathing Felts, Boiler Scale Preventive, Acid Water and Fire-proof Compositions, Paints, &c., and dealer in "ASBESTOS, ASPHALTUM, and general Roofing materials."

Descriptive Pamphlets, Price Lists, Terms to Dealers, etc., by mail. H. W. JOHNS, [Established in 1858.] 78 William St., N. Y.

ORIENT SAFETY LAMPS,

Entirely of metal, are the only lamps in use which can neither break, leak nor explode. Are ornamental and cheap. Adapted to all household uses; also, to stores, factories, churches, &c.

AGENTS MAKE $10 A DAY
SELLING THESE LAMPS,
Manufactured by

WICKES' ECLECTIC OIL

is designed for use in ordinary kerosene lamps wherever good light and perfect security from accident are required.
J. H. WICKES, 120 Maiden Lane, N. Y.

STEEL
CROW-BARS AND HARROW TEETH.

We beg to call the attention of Farmers and others to this new class of goods—quite as strong, with two-thirds the weight, and less cost than the old-style iron ones. Sold by Hardware Dealers generally.

Crow-Bars..... 10 to 30 lbs..... 14 cts. per lb.
Harrow Teeth.. ⅜ in. square.... 12½ "
" " .. ½ " .... 13½ "

Address SWEETS M'F'G CO., Syracuse, N. Y.

Agents Wanted for **THE NATION.**

Is needed in every home; has 10 Illustrations; all U. S. Presidents; all U. S. Censuses; all U. S. Senators; all valuable documents. Is prized by all! One agent reports 261 orders in 6 days. In English and German. *Write us.* NEW WORLD PUBLISHING CO., 7th and Market, Sts., Phila., Pa.

You ask WHY we can sell First Class 7 Octave Pianos for **$290**? We answer—It costs less than $300 to make any $600 Piano sold through Agents, all of whom make 100 per cent. profit. We have no Agents, but ship direct to families at Factory price, and warrant 5 Years. Send for illustrated circular, in which we refer to 300 Bankers, Merchants, &c., using our Pianos in 40 States and Territories.
U. S. Piano Co., 865 Broadway, New York.

ACENTS WANTED FOR
"JESUS."
By CHARLES F. DEEMS, D. D.

His divinity established and rationalism routed. The most popular and rapidly-selling religious work ever issued. For Circulars, address UNITED STATES PUBLISHING CO., 411 Broome St., New York.

BAXTER ENGINE.
2 to 10 Horse Power.
☞ Send for Circular and Price List to
WM. D. RUSSELL, 18 Park Place, New York.

A GREAT CHANCE FOR AGENTS.

Do you want an agency, *local or traveling*, with a chance to make $5 to $20 per day selling our new 7 strand *White Ware Clothes Lines? They last forever*; sample free, so there is no risk. Address *at once Hudson River Wire Works*, cor. Water St., and Maiden Lane, N. Y. or 16 Dearborn St., Chicago, Ill.

WEBSTER'S PATENT
BUTTON-HOLE WORKER.
Patented June 27, 1871.

One of the most important inventions of the age! The most perfect Button-Hole Worker ever invented! So simple that a child can work a more perfect button-hole with it than the most experienced hand can work without it. Every stitch is taken with the most perfect mechanical accuracy, is used entirely independent of the sewing machine, and will last a life-time. Does away with pricking the fingers, straining the eyes, and with imperfect and irregular worked button-holes. They give universal satisfaction. Ladies who use them say that they are worth their weight in gold. Over 11,000 sold during the first week of their introduction. The most liberal inducements offered to the trade. Dry Goods and Fancy Goods Merchants find it an excellent selling article. Local and traveling agents wanted everywhere.

Samples and terms, with full directions for use, sent prepaid on receipt of 50 cents. Orders by mail receive prompt attention. Address

Floricultural.

IVIES FOR INSIDE DECORATIONS.

WE herewith give an illustration of the interior of a wide hall decorated with ivies. The plants are grown in large pots, and then trained upon wire trellises fastened to the wall and ceiling. The illustration explains itself better than we could in words; but we will add that, there being many varieties of the ivy in cultivation, it is advisable to use more than one, for the sake of contrast, some of them having beautiful, variegated leaves; others are broad, heart-shaped, and almost as broad as a man's hand; while others are deeply cut or palmated. All these different forms add greatly to the beauty of the whole.

It may also be stated that the room decorated with ivy should not be kept too warm, but at a moderate temperature; such as is most healthful for a person is the best. No one need fear to make the room unhealthy by introducing the ivy in abundance; for plants purify the air, and it is only when we introduce those emitting strong odors that anything but beneficial effects result. As all the ivies succeed well in the shade, they are more suitable for the purpose herein designated than almost any other kind of plant.

There is also another plant largely used for this purpose, which is not a true ivy, although known as German Ivy (*Senecio scandens*). It grows even more rapidly than any of the true ivies (*Hedera*), and we have seen a small plant grow so fast that it encircled quite a large room in a few weeks. It thrives well in the shade, and the leaves resemble somewhat the common English ivy, but are of a lighter and more cheerful green color. This, and a great variety of ivies, are grown for sale by our florists.

SPRING TREATMENT OF AURICULAS.

A correspondent of the Journal of Horticulture says:—I maintain that the Auricula ought never to have a drop of rain, and least of all in the spring. Every grower of this beautiful flower knows that its greatest enemy is damp, and that his efforts are directed to the great end of giving it a free and open situation, keeping it free from drip, and not allowing water to settle in the heart of the plant. Unless you are for ever near your frames, it is impossible to do this and yet let them have any rain. If you leave directions with your man that they are to have only gentle showers, you will find some day to your cost that this idea of a gentle shower differs very widely from yours. For the safety of your collection, I strongly advise no showers. But even if you allow them to get rain under your own eye, the drops will settle in the heart of the plant, and then canker and decay take place. Rain may possibly run off the plain-foliaged plants, but those with the mealy foliage retain it very pertinaciously, and nothing will free them of it except taking the plant up and blowing the water off. Then, too, I think that to allow the mealy-foliaged plants to become spotted with rain entirely destroys their beauty. I grudge even when watering that the outside leaves should get any on them, and should sadly grieve if the beautiful young leaves were to be thus injured.

Iris Reticulata, a lovely purple flower, with a bright, golden lip, is pronounced by florists a beautiful early blooming bulb for green-house pot culture.

FLORICULTURAL NOTES.

Texas Plants.—Enclosed find plant, which please name for me. It is one of our earliest flowers; the prairie is now covered with them. It is about two weeks earlier than the Snowdrop, and, as it is a bulbous plant, I think deserves a place in the flower-garden. I also enclose you the labels which came around some bulbs which a friend sent me. I cannot find either of them in any bulb catalogue, nor in GRAY'S Field Book of Botany. Please give description, and tell me how to cultivate.

There used to be cultivated in old gardens a plant called "Globe," the seed of which exactly represented the outline of a man's face. Can you give me the right name for it? I have looked dozens of seedsmen's catalogues through in vain, hoping to meet with it.—DICK HOPSON, *Sherman, Texas.*

THE little plant, with pink flowers, veined with purple, is the quite common *Claytonia Carolina*, or "Spring Beauty." There is another, equally as common, but larger-growing species (*Claytonia Virginica*), also known by the same common name. They are exceedingly pretty plants, and we are not surprised that so early a flower should attract attention.

The labels of bulbs enclosed are: 1—*Anomatheca cruenta*, a small, bulbous plant, cultivated in conservatories at the North, but will probably succeed with you in the open ground. Flowers, blood-red, approaching a scarlet. The plants bloom freely throughout the summer, if planted in the garden, and taken up in autumn; or the season may be reversed, and by cultivating under glass, they may be made to bloom in winter, and dried off and given rest in summer.

2.—*Phædranassa chloracea* is a South-American bulb, requiring similar soil and treatment as that given to our common lilies, except that, in localities where the ground freezes in winter, the bulb should be taken up and kept dry in winter. The flowers are crimson. The other label you send we are unable to make out, and think that the same is misspelled, as we know of no plant, the name of which comes anywhere near it.

Ivy Culture.—Will some one give the name of an Ivy that can live in a room where it will freeze occasionally? I read so often of Ivy being trained over frames and arches; but will it live in a room with an open fireplace, and where the soil will be frozen a few times during the winter?—A SUBSCRIBER.

THE English or Irish Ivies are quite hardy when grown in a half shady situation. But when cultivated in the house, where the heat excites growth one day and the temperature is allowed to go below freezing point the next, the plants are liable to be injured. If your room is so cool as to prevent any growth in winter, a little freezing occasionally will not injure any of the hardy or half-hardy Ivies.

ROOM PLANT-CULTURE AT ST. PETERSBURGH.

How to Start Flower Seeds Without a Hot-Bed.—Procure a block 4 inches long, 3 wide and 2 thick. Take strong paper—a flour sack—cut it the length of the block and wide enough to reach around it, with an inch to spare. Prepare flour paste, set down with your lap-board, and paste the paper around the block lengthwise; then draw it down far enough to paste over one end; slip it from the block and you have a box. Ask Mr. CANDLE to make you two or three shallow boxes of old boards, in which to sit these paper boxes. Write the name of the seed you intend to plant on each box, fill with fine, rich earth, and a little sand; put a few seeds in each one, keep moist with warm water, cover with flannel, and set in a warm place. Thus plants can be grown. —MRS. E. M. TAYLOR.

Crape Myrtle.—I would like to inform your readers that a white Crape Myrtle is not a new thing in Texas. In the summer of 1863 I boarded three months with a lady in Polk county, Texas, who had trees of the pink, purple and white, at least ten feet high. It is a charming shrub. If any body has raised one from seed of the pink, he did well; but it was not the first white crape myrtle. I see the New Orleans Delachaise Nurseries (R. MAITRE) have a red one in their catalogue, and the Magnolia Nurseries advertise both crimson and scarlet; the latter I have never seen.—A. B. N., *Brownwell, Texas.*

English Crocus or Snow Drop.—Lady G.:—The flower you now send us is the Snow Drop—*Galanthus nivalis;* but it is very distinct from the blossom produced from the bulb sent us last fall as "English Crocus," which proved to be as we said in RURAL, Feb. 17. *Narcissus suavis.* You ask the language of these flowers. According to WOOD, *Crocus* means, "What an enigma thou art;" and *Narcissus*, "Egotists are agreeable only to themselves."

A Vigorous Verbena.—I raised a Verbena from the seed, last season, whose branches, together, measured 378 feet. This seemed to me such an extraordinary growth that I thought I would ask if any brother or sister reader of the RURAL has beaten it. —E. P. RICHARDSON, *Lawrence, Mass.*

Hybridizing Flowers.—"Heart's Ease," Indianapolis, Ind., urges American florists to pay more attention to the improvement of flowers by hybridizing, and proposes to give instructions in the method. We shall be glad to hear from him.

Iron for Roses.—A correspondent of an English paper recommends the laying about rose bushes old iron. He finds that the iron rust acts as a tonic to the rose.

WE have several seasonable communications for this department for which we have not yet been able to find space. They shall appear soon.

Sheep Husbandry.

ATTEMPT TO REPEAL THE WOOL TARIFF.*

THE fact has transpired, in a way that admits of no doubt of its correctness, that the Ways and Means Committee in Congress have, by a majority of one, determined to report in favor of abolishing the present duties on *combing* and *clothing* wools, and substitute therefor merely *ad valorem* duties of thirty per centum. The N. Y. Tribune, March 14, thinks the proposed *ad valorem* rates may be fifty per cent. We cannot say what changes may take place in the determinations of the Committee, before making their report, but at the time of this writing (March 18) they stand committed by vote to the thirty per cent. rate. But in the practical result it makes not the slightest difference which rate is adopted. Either is fatal to the wool husbandry of the country. The Ways and Means Committee have also substituted for the present duties on woolens, *ad valorem* duties of fifty per cent. on all manufactures of every description, composed wholly or in part of wool.

Who has called for this sweeping change? The Rhode Island wool manufacturers have done so. A few free trade newspapers, free trade leagues, etc., have done so. But the great masses of the people of the country, and of the industry of the country, have neither asked for, nor do they wish it.

The wool tariff of 1867 doubtless saved the growers' interests from entire destruction, from the time it went into effect until the close of 1870, but it did not help them until after that period sufficiently to render growing profitable. There were impediments to be removed before it could do so. The failure of Congress to pass the bill in 1865-6, allowed importers, in anticipation of its passage, to forestall the markets under nominal rates of duty. Seventy million pounds of wool and woolens of the value of $57,115,000, almost equaling the entire imports of the four preceding years, were imported in 1863. The government, too, at the close of the war, threw millions of dollars' worth of its woolen army stores on our markets at mere nominal prices. Various other circumstances, which have been too often specified to require repetition here, operated in the same direction. Wool was grown at a loss in all the principal wool-growing States of the North. Sheep sold for a song. Sheep, for example, that had fetched six to eight dollars a head in Illinois during the war, sold from fifty cents to a dollar a head. A large proportion of the growers could not hold on to their flocks for the good time coming, and killed them for their pelts. Yet the growers did not move for any change in the tariff. They were satisfied with the law. They knew it would bring relief to those who could hold on, when the obstructions in the way of its normal operation should be removed. All who could encounter the temporary losses held on. At length, in 1871, the law began to produce its legitimate effects. Wool-growing became profitable, but not more profitable than dairying had been for a number of preceding years. No sooner did this occur than the Rhode Island manufacturers and the "revenue reformers" commenced agitating for repeal. They did not produce much effect in the session of 1870-71. But the remarkable and exceptional condition of wool production now existing throughout the world—the "wool famine," as it is called—which has raised the price of wool to an extraordinary pitch in every country of the world, is now seized upon as an excuse for agitation. Our people are to be made to believe that the wool famine *throughout the world* is due to our tariff—or that the repeal of the tariff will relieve that famine!

But, famine or no famine, we should have had a repeal agitation. The Rhode Island manufacturers, who can readily see why the manufacturers of a product should be protected, while the grower should not, though equally needing it, would have equally clamored for the restoration of the "good old times," when their feet were on the necks of the producers. The revenue reformers would, of course, co-operate with them. And the chronic tendency to *change* in tariff legislation could not have failed to manifest itself more or less extensively in Congress, in case of any tariff law which had been in effect upward of four years! Speaker BLAINE placed a majority of revenue reformers on the Ways and Means Committee, and hence, repeal has the important advantage of that Committee's official recommendation.

Is there danger that the repealers will be successful in their assault on the wool and woolen tariff? We think it is unsafe to act on any other hypothesis than that there is danger. There are enough wavering, undecided members of Congress, who will swim with what they believe to be the current, to render the result doubtful. It is the business of the growers and the friendly manufacturers to show them which way the popular current really sets. We are not of the opinion that petitions will be of much avail for this purpose. The manufacturers must judge of their own course of procedure, but we advise intelligent growers immediately to address their representatives and State senators, *by letter*, on this subject. (Neighbors might join in the same letter, if they chose.) It is not necessary to their effectiveness that they be argumentative or long. Those who have important facts or arguments to communicate, let them do so; those who have not, let them merely express their wishes. These letters will strengthen the hands of decided friends, and tend strongly to influence the action of the undecided and wavering. If the friends of wool protection will thus show their hands, and do so promptly, we shall have no doubt of the result.

We cannot but hope we shall obtain some (secret or open) assistance from our most far-seeing and discreet opponents among the hostile manufacturers themselves. We have not chosen to argue that question now, but we fully believe that repeal would involve the manufacturing in as complete destruction as the wool-growing interest. We know such to be the fixed opinion of the leading manufacturers who belong to the National Association of Wool Manufacturers. We cannot believe all the anti-tariff manufacturers are so blinded by their prejudices as not to see the facts in the same light. What is the meaning of the following paragraphs, from the New York Economist (March 16), the organ of the New York wool trade, and hitherto the bitterest denouncer of the wool and woolen tariff of 1867? They have special significance, and we invite an attentive perusal of them:

"We have sound reason to believe there will be no change in the Wool Tariff, nor is it at all desirable just at this moment, for verily no greater calamity could befall the manufacturing interest than to *reduce the Tariff* just now, because it would afford no relief, as we have shown above, by way of *Cheap Wool*.

"Besides, if the duty was taken off of wool the Western farmers would, in a body, advocate free trade. *Free wool* means *free goods and cheap woolens*. If the manufacturing interest generally, and the Government, stand ready to advocate this policy, we are equally ready with the people of the West to *advocate open Free Trade*.

"Now, if the ports were thrown wide open to-morrow to free wool, it would not help the manufacturing interest much. It is true it would set more sets of woolen machinery in motion, but it would cheapen goods at the same time and cause the farmers to kill their sheep in whole flocks—in thousands; the very thing we are endeavoring to discountenance at present. If Congress and the manufacturers of New England will but let the Tariff alone, we shall get the farmers, after a year or two, to grow a sufficiency of wool at low enough prices to keep all the woolen machinery of the country in full motion the year round."

No friend of the wool and woolen tariff could have stated the results of its overthrow, or even of its *reduction*, more correctly.

*Dr. RANDALL wrote and mailed this article in time for our last issue, but the snow blockade on the railroads prevented its arrival in season.—[EDS.

NOTES AND QUERIES.

Fat Sheep Dying.—I found in the lot a very choice ram of mine dead. The morning before he was as well as he ever was. The next week I had two very choice ewe lambs die. One of them died in an hour from the time it was taken sick. Yesterday morning I found a large fat sheep that could not stand, which died in a little while. These sheep were all fat. What was the cause?—S. C. LEWIS, *Orleans Co., N. Y.*

Did our correspondent make a *post-mortem* examination? If so, what did he discover? It may be they died of over-fatness, plethora, or apoplexy. When sheep are so taken, SPOONER recommends a dose of two or three ounces of Epsom salts for full-grown sheep, and for lambs half a dose. RANDALL recommends, for Merino sheep, two ounces of the salts, followed by an ounce every six hours, until copious evacuation takes place.

Sheep Dying in Wisconsin.—Geo. PELTON, Sauk Co., Wis., Feb. 17, writes:—"Our sheep are dying off pretty fast. They seem to grow poor, notwithstanding they are fed grain and roots. They go off by themselves, refuse to eat, and soon die."

Field Crops.

ORCHARD GRASS.

MY attention was arrested by a remark, in the RURAL NEW-YORKER of March 2d, by an "Old Subscriber," in regard to Orchard Grass," and your appended remarks. Will you permit me, as one who has had some experience with Orchard Grass for the last six years, to say a word in regard to that most neglected grass? Were I to be asked, "Which, of all the grasses with which you are acquainted, do you value most for *pasturage?*" I would say, emphatically, Orchard Grass. From my experience with it, I think that one acre well seeded to Orchard Grass, is worth, for pasture, two of Red Clover, or four of Herd's Grass, on land that is easily affected by drouth.

I have been surprised, in my intercourse with farmers, to see how many have never heard of such a grass, and how few of the remainder have interest enough in it to try to post themselves up in regard to its real value. Were there far more Orchard Grass sown in our pastures, I think there would be less complaint of cows "falling off in milk" as the dry season advances.

It is better than Herd's Grass to use with Clover in seeding down our meadows, for these four reasons:—It gives more hay per acre; it is in its prime for cutting just when Clover is; it roots much more strongly, and consequently "throws out" much less than Herd's Grass; because of its strong roots and rapid "after growth," it is a *real protection* to the Clover. My advice to every farmer is, Do not raise *less clover*, but *far more Orchard Grass.*

Waukesha Co., Wis. T. LOOMIS, SEN.

TOBACCO—QUALITY AND CULTURE.

IN reply to A. G. H., Clayton O., in the RURAL of March 2, I would say, that I am told by an old tobacconist that the quality of tobacco seems to depend a very great deal upon the climate or latitude, or perhaps both. The same kind of tobacco raised in Connecticut or Minnesota, which is worth from eighty cents to a dollar per pound, if raised in Ohio, Pennsylvania, Indiana or Kentucky, will bring only from ten to fifteen cents per pound. It is better if grown in Maryland. If grown in Cuba or some of the neighboring isles, it is far superior to that grown in Connecticut. But if grown in Florida and some other Southern States, it is very poor indeed. Who can tell the cause of this? Tobacco should be topped soon after the buds are formed. The number of leaves left depends upon circumstances. If late in the season, it should be topped low, so that it will ripen up quick; if early, of course top high enough to save all the most valuable leaves. Keep the suckers and worms off *all* the time. It makes but little difference whether it is done when the dew is on or off, if it is only done. AN EX-TOBACCO GROWER.

Winona Co., Minn.

FIELD NOTES AND QUERIES.

A Corn Swindle, Probably.—We have a circular sent us by a correspondent, which issues from Cincinnati, in which the statement is made that the subscriber received three kernels of corn from his brother in Hungary. The circular says, "Last year I planted the grain on nearly an acre of ground, and raised, with ordinary culture, 100 bushels of corn from it." It seems to us hardly necessary to say that this is too apparently an attempt to swindle to warrant us in supposing that any one will be duped by it and send $2 a pint for the seed.

Selecting Seed Corn.—I fear it is not generally the wisest of your farmer friends who write to you. Instance the long harangues about corn raising. They were indeed interspersed with many useful hints; yet look at the chaff. Only one person hinted at the fact that all of the grains of corn on the cob should be planted; but he did not give the true reason for it. Most intelligent persons know the reason hinted at, but your writers, it seems, did not. When quite a boy I had learned that grains taken from different parts of the cob developed and ripened differently. I experimented by planting a few grains from the extreme ends. The hills planted from the butt ripened about a month before those from the top. Now these are reasons why the whole ear should be planted, except you wish to modify the time of ripening. Corn to replant should be taken from the butt of the ear. All observant farmers know that they should have late pollen for late issues of silk that is produced by "late rains," which "fills out" our corn crop. The corn from the point of the cob will do the job. If you want a few plain, simple facts, just call on your friend—FLEATOW.

IT is the fault of "the wisest of our farmer friends" that they do not write for us—not ours, for they know, or ought to know, that they are always welcome. We have to publish "a little nonsense now and then," to call them out. We call, at his suggestion, upon "Fleatow" for "simple *facts*." Has he got them? Will he furnish them?

A Tanning Potato.—A correspondent at Canon City, Col., writes us that he has discovered there a potato that is largely charged with tannic acid. Being a tanner, he has tested it, and finds it tans hides very readily, and quicker than bark. He says it yields abundantly, is soft as a potato, and only needs boiling to yield its tanning qualities. He wants to introduce it to the attention of tanners, and asks us to take an agency, which we respectfully decline; but we would like to see a single specimen of it that we may determine what it is.

Orchard Grass.—F. P. MARTIN is informed that we should prefer to sow Orchard grass for pasture, under the circumstances he details. We think it will prove more profitable than Blue grass.

The Swine-Herd.

DISEASED PIGS.

ALLOW me to give you the symptoms of a disease prevailing among my pigs. I would like to know what is the matter and what to do for them. The pigs are between four and five months old; have been kept in the pen on the floor and well fed with corn, milk, slops from the kitchen, etc., and out of a litter of six all but one have been attacked, with more or less severity, about as follows:—I noticed first that when one of them would attempt to eat corn it would be attacked with cramps or spasms; would run backwards, fall on its side, and lie for some moments as if suffering the most intense agony, when it would recover, get up, and walk about the pen apparently blind, running against any object that happened to be in its way. Others would not cramp so badly, but would get stiff, and could with difficulty walk at all. One of them has for two weeks been unable to stand on its hind feet, but is slowly recovering. I notice, when first attacked, a constant grating of the teeth, and an indisposition to eat, particularly hard substances. When attempting to drink, they swallow with difficulty, strangling and coughing and throwing the milk or water from the nostrils. I have been applying some simple remedies. Two have nearly recovered, while two are improving very slowly, and one has just been attacked. There are some large hogs in another part of the same pen. What is it? and is it contagious and likely to attack the larger hogs? E. W. LIBBEY.

Cuyahoga Co., Ohio.

PIG-PEN PAPERS.

Tribute to the Berkshire.—The Editor of the Rural World says of the Berkshire: "The Berkshire is a grazer and fruit eater in such a degree that we have him in killing condition on such feed alone. We have them fat, healthy and good breeders, that have not consumed a bushel of corn a head in the year. They feed on clover and blue grass, fallen fruit and acorns, in summer and fall. In winter and spring, turnips and potatoes, with bran, shorts, and a little cotton seed meal, is the regimen adopted. We prefer the sire to be twelve months old, but his services are often valuable before that age."

Castrating Pigs.—I lost some fine shoats last fall in spaying. I thought there might be something in time and sign. Now, if you believe there is anything in the sign and time it should be performed, please give me the necessary information, explicitly. —C. JONES.

WE have never observed signs or times in our practice, except we usually castrate those we desire to just before weaning—say a week or ten days previous.

Hogs Eating White Corn.—Having noticed in RURAL NEW-YORKER an inquiry in regard to hogs preferring white or yellow corn, I confess I never had trouble in getting my hogs to eat white corn, but I do not know that they ever tasted yellow.—A NEW YORK FARMER.

The Apiarian.

TO MAKE A BEE HOUSE.

BEE culture forming one of the topics discussed in your columns, the results of actual experience in that line may prove of interest to those of your readers seeking facts rather than theory. In this latitude the moth or miller proves very destructive; many experiments have been made to counteract the evil, yet few, if any, are found effectual. My experience for the past seven years warrants the belief that the object has been attained by the construction of a bee house more particularly designed to obviate the trouble and danger attending the hiving of new swarms.

As this is the season when the bees are in a dormant condition, and easily removed, a description of my bee house may prove of value, especially to amateurs, or those who would gladly keep the insects were it not for the danger from their stings and trouble of hiving them.

Four locust posts, seven feet long, squared for four feet of the length, and set three feet in the ground, so as to form an oblong square four feet wide by eight feet in length, will form the frame of the house. On the top of these posts are spiked two scantling, two by four inches, to form the support for a comb roof, which should project twelve inches all round. At the hight of ten inches from the ground fit in a floor in form of a double inclined plane, or inverted V, giving it about the same slope as the roof, allowing each side of the floor to project one inch outside of the posts, to afford a place for the bees to alight on before entering the house. Line up and ceil on the inside of the posts, and weatherboard on the outside, and the work is done. Place a movable glass sash in one end, to observe the working of the bees, and over that a light wood door. Leave a space of half an inch between the floor and lower weather-board on each side, to give entrance and exit to the bees.

This house is amply large for four hives of bees. I use a box hive 14 inches square in the main body, with space on top for two boxes 14 by 5 inches each, and a frame 14 by 14 square, and 3 inches high, attached to the bottom. In this frame is fitted a double inclined plane with a half inch space between it and the side of the hive, beyond which it projects a half inch. These hives are suspended by cleats about four inches above the floor of the house, which should be planed smoothly on the upper side to allow dead bees, vermin or dirt to roll outside.

My bees have not swarmed for seven years, but the colonies are very strong, and the annual yield of surplus honey, from the boxes, is increasing. Large combs now cover the outside of the hives, which if not removed early in the fall, the honey therein contained will be removed to the interior of the hive by the bees for winter supply.

During the past seven years I have not found the miller at work in the hives, though occasionally found in the house, or alighting on the board outside. The darkness inside of the house probably prevents the pest from finding its way into the hive. I am satisfied with the test.

The primary object in view, in the construction of the house, was to prevent swarming of the new colonies, which has proven a success, owing, it is presumed, to the absence of that degree of heat necessary to hatch the eggs deposited by the queen. If, in addition to that, freedom from the ravages of the moth has been secured, two great evils have been removed, and amateurs, or private families wishing a supply of honey without cost, can attain it by adopting my method, which they are at liberty to do. Of course those who raise bees for profit are not likely to adopt it.

I will only add that the house may be highly ornamented, so as to add to the beauty of yards or flower gardens. Mine stands in a front door yard, covered with flowering vines and roses. Ex.

Gallipolis, O.

"BEE HIVES."

WE find in the RURAL of March 2d an article from the pen of J. E. MOORE, with the above caption. It seems that friend MOORE is considerably exercised over that hive we described in the RURAL NEW-YORKER some time since. In the first place, he quotes from our former article, endeavoring to show that we had not tested, or ever seen in use, hives upon which we had passed judgment. In the first line of friend MOORE'S quotation from our article, the word "neither" should have been published "either." It was so written in the original manuscript, and should have been published so. The hive we mentioned some time ago, that we were satisfied combined more advantages, with fewer objections, than any one yet devised, was *not* the one we gave a description of, and friend MOORE *knew* it when he penned his article!—at least, any one possessing a grain of common sense must have known it, even though he had only casually read our article. Perhaps his statement that we described a hive that was in use some fifteen years ago, may seem plausible to some; but the facts in the case are that we did *not* describe the LANGSTROTH hive; nor was the two-story LANGSTROTH hive in use at that time, by a considerable. We hope Mr. M. will keep his assertions more within the bounds of truth and propriety in the future. We doubt not but that Mr. M. thought he was perpetrating a nice joke when he copied from our article, placing some of our own words in italics, thereby endeavoring to distort our meaning; but we leave it to your readers whether such measures are either fair or honorable.

We, too, prefer a hive that will give us more perfect control over our little yellow pets, and have a hive of our own invention that will give it. But we *never claimed* that the hive we described was the *best one in use*, as friend MOORE *very well knows*. What we did say was that it was the best hive we had yet tested. We assure your readers that it is a *good* one, as is amply proven by many of our best apiarians, who have had it in use. We think that we are entitled to our own opinions and preferences, as well as friend MOORE, and if we prefer to use the two-story hive, why should he object? We think we can give as many instances where those who have used the two-story hive, have made bee-making a success, as he can of those who have used the one-story hive. We should not have made any reply to his article, only some of our correspondents wished to ascertain the truthfulness of his assertions, that they might know to a certainty whether we had endeavored to mislead them or not.—HERBERT A. BURCH.

Entomological.

ANGOUMOI'S GRAIN MOTH.

INCLOSED you will find specimens of several kinds of wheat, rubbed from heads which grew in the vicinity of Chambersburg, Pa., and harvested in the summer of 1871. The heads were of good size, well filled, and the wheat, when shelled, apparently of good quality; but, upon a closer examination, about nine grains out of every ten were found to contain a small grub which, in the latter part of September, or early part of October, came out in the form of a small moth, specimens of which you will find inclosed. (For living ones put this wheat in some warm place for a time.) What is the name, habits, &c., of this insect?—W. S.

THIS insect is the well known destructive Angoumoi's Grain Moth—*Butalis cerealella*. Its common name is derived from a province in France, where it was discovered more than a century ago, doing immense injury to wheat and other grain. The date of its introduction into this country is unknown; and HARRIS states that it was known to be in Virginia as early as 1768. It not only attacks wheat while in the field, but after it is stored; also corn in the crib, but particularly when grain is kept in a warm room. It is one of the most destructive insects known, and farmers should be on their guard lest they unwittingly aid in its dissemination and propagation.

The moth is quite small, the wings expanding scarcely more than a half an inch. The body and fore wings are of a brownish gray; the hind wings are of a dull lead color, surrounded by a black fringe.

The best method of destroying this insect, when in stored grain, is probably by fumigating with gas from burning charcoal. The store-room should be made tight and the grain placed in such a position that the gas shall reach every portion. The fumes of burning charcoal will neither injure the grain, as it imparts no bad flavor to it, nor impair its power of vegetating. Heating the grain is also resorted to in France to destroy this insect. Farmers must be constantly on their guard when receiving seeds from seedstores in any of our cities, or abroad, because noxious insects are constantly being introduced and disseminated through these channels.

Study Insects.—Let those who send us insects for identification study their habits, tell us on what and when they are found, what birds or insects prey upon them, and all the detail of information acquired.

The Gardener.

FORCING CUCUMBERS.

PROBABLY few of the readers of the RURAL NEW-YORKER are aware of the extent to which cucumbers are forced for market. It is not wholly confined to our larger cities, but in the small inland towns and villages this vegetable is extensively cultivated. My experience in forcing cucumbers occurred in a village several hundred miles from New York, where I had an eighth of an acre of frames filled with this vegetable, while a neighbor had six span roof houses devoted entirely to its culture. Believing that some of your readers may be interested in this branch of gardening, I will give them the practical details of my operations and success, although I shall take a different standpoint from some of the gardeners around New York. Still, I will endeavor to show the why and wherefore, which I think many authors have failed to do. For instance, all say that the watering must be done with tepid water in cold weather; but in the books that have come under my observation not one has stated the manner in which this tepid water is to be obtained. The size of sash usually employed is 3x6, but I like 4x5 better, for the following reasons:—1st, they are not so liable to settle in the center in case of a heavy fall of snow; 2d, three feet is farther than a man can reach to trim the vines; 3d, in using this size sash I can make my straw mats 5x6½ feet; then the straw will lie lengthwise the sash, the same as shingles on a roof, thereby permitting the rain and snow to pass off more readily than it will crosswise of the straw; and it can also be swept off more easily. My frames were made out of two-inch plank, the back, or top, 18 inches in hight; the bottom, or front, twelve inches, with two strips across the frame on which the sash rested.

Preparing the Hot-Beds.—Never excavate, but always build your beds above the ground, for the reason that cucumbers require a large amount of water; and if a pit is dug, that which is applied to the plants will settle under the beds, causing the manure to rot and the heat to subside. Always use fresh stable manure—that which has not fermented. If several frames are to be used, draw the manure to where the beds are to be made, making a long winrow, care being taken to prevent excessive heat.

The manure should not remain over four days in the rows without being shaken up with a fork. Lay out the bed one foot larger in every way than the frame. Shake the manure carefully, and beat down firmly and evenly with the back of a fork, but never tread on it with the feet. I should as soon think of walking over the sash as over the manure in my hot-beds. Some may think this of minor importance; but having tried both plans, I have become satisfied that a hot-bed made in this way will retain heat longer and give better satisfaction. The depth of the bed should be at least two feet when finished, if made early in the season, although there is little to be gained in making them before the 15th of February, for one must have the light and heat of the sun to raise cucumbers successfully. As soon as the beds are prepared, place the frame and sash on them, and as the heat rises give a little ventilation. It should remain thirty-six hours or more before the soil is put on, which should consist of one-third well rotted manure and two-thirds of sandy loam, well mixed together; the soil should be eight inches deep.

Plant the seed in four-inch pots, putting five or six in each; then plunge them into one end of the frame. When the plants begin to grow, bank up around them every three or four days; this will cause new roots to shoot out from the covered stems. When the plants have grown six inches long, take them from the pots and transplant into the frame. I usually place two plants in the center of each end sash and one in each of the others; lay the plants down, covering the stem up to the leaves. Choose a warm day for transplanting, as the plants are very tender and should be carefully protected while being carried from frame to frame. After the vines have grown eighteen inches, they should be layered again—that is, six or eight inches of the vine covered with soil. As the vines advance, the leaves will touch the glass; the sash may then be raised by placing a stone or a block of wood under each corner.

I usually sow, at the same time I plant my cucumber seed, some Silesia lettuce, also some olive-shaped radishes. As soon as large enough these are transplanted in the bed, leaving a vacant place a foot square in the center of each sash for the cucumbers. I always get two crops of radishes before the vines begin to run, and as soon as this occurs the bed should be cleaned, and all dead leaves removed and the ground worked over with a hoe or rake.

Watering.—I know of no vegetable that requires as much water as the cucumber; and when one intends to grow it extensively, this should receive careful attention. I use the common watering pot; though if one has a force pump and hose, the watering can be done more rapidly, and at less expense. I speak now of watering in the summer, when the water does not require warming. Always water in the afternoon, commencing at about four o'clock; close the sashes after watering; the plants will then be dry by morning, which is the usual time for picking the cucumbers.

Tepid Water.—Make a bed the same as for a frame; on this place two boards crosswise; place a hogshead on the boards, then cover the whole with fresh manure. As the heat subsides remove the old, covering with fresh manure as before. I use a large sheet-iron funnel in the top, and a large faucet to draw the water as wanted.

Ventilating.—This is a very important point, and requires a great deal of judgment as well as practical experience, before one can be a successful grower of this vegetable. At a time of year when snow storms are frequent, and the beds have to be covered with mats two or three days in succession, the vines become tender, and I have often had to keep two men busy raising and lowering the sashes. When the sun was shining bright, the sashes were raised; when in a cloud, they were lowered; but this seldom occurred. I usually give a little ventilation at nine o'clock in the morning, increasing as the day grows warmer, though cucumbers will stand a temperature from 80° to 110°. As I said before, we gain very little by making hot-beds too early, because nearly all of the flowers will be males, and it is important that we give ventilation for the purpose of scattering the pollen from flower to flower. If the weather does not permit of this, it may sometimes be advisable to scatter the pollen by hand, that is, by cutting off the staminate flowers and shaking them over the pistillate, although this is seldom necessary.

Insects.—The insects most troublesome to cucumber vines grown in frames are the green fly (*Aphis*) and the common cucumber or square bug (*Coreus tristis*). The former can readily be destroyed by fumigating with tobacco; but the latter is not so easily got rid of, and the most effectual method is hand picking and crushing. By being constantly on the alert, the first bugs that crawl into the frames may be killed and thereby prevent an increase in number.

Fearing that some may think that raising cucumbers for market would not be a very profitable business, I may state that from the one hundred and thirty sash, we picked and sold eleven thousand cucumbers. The largest number cut from one sash, in one day, was twenty-two. The average price through May was six dollars per dozen; the total receipts for the season were $800. Of course the profits would depend somewhat upon the price paid for manure. Near New York, where it is worth from five to six dollars a cord, the profits would be less than where it is only one dollar for a two-horse wagon load, the price paid by me. H. C. F.

Hygienic Information.

HYGIENIC NOTES AND QUERIES.

Remedy for Rheumatism Wanted.—C. L., Waterloo, N. Y., a boy 12 years old, does not go to school, because he has the rheumatism. He writes:—"I have had it near three years, and it is so lonesome in the house all day long, that if any of your numerous readers will inform me what will cure it, I shall be very much pleased."

Relief for Sick Headache.—JAMES LORD, Erie, Pa., writes the Scientific American that he has found relief for the sick headache by the use of a bath of hot water, softened with carbonate of soda, taking the bath in a sitting position, and remaining in ten to fifteen minutes.

Cure for Caked Breasts.—At the first symptom of soreness, take a dose of salts, or some other physic; it operates like a charm. The trouble is occasioned by taking cold and being bilious. Bathe the breast in hot vinegar, but not too much, as it dries up the milk.—EXPERIENCE.

The Herdsman.

COOKING FOOD FOR STOCK.

I SEE farmers are complaining of their stock getting poor, and discussing the propriety of giving them cooked food; but the question don't seem to be decided, whether it would cure the evil or not; and the more sensitive question, "will it pay?" is the drawback in trying experiments. Now, as every civilized nation has its own way of treating this subject, it may not be unacceptable to you if I state how they meet this question in Scotland, where the science of chemistry is made the slave of agriculture, and has wrenched results from a cold and sterile soil which would be considered magnificent in the virgin soil of some of the older States of the Union.

Every farmer there knows, from experience, that to keep his stock in good order

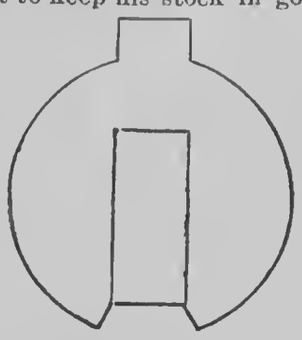

FIG. 1.—FEED BOILER.

he must raise turnips to feed them during the winter. A farmer with 150 acres, raises from 25 to 30 acres of turnips, which are used in the following manner: Those animals that are to be fattened for the butcher are tied up and fed with as many sliced turnips (which are cut with a revolving machine) and as much oat and barley straw as they can use; also a piece of rock salt, which they lick at pleasure. In two months, the fattening process is completed, when they are sold. When they want to hasten the manufacture of beef, they, in addition, give them bean flour. The cows are also tied up, and receive turnips in lesser quantities than those that are to be sold. The calves of the previous summer are likewise tied up, which keeps the larger ones from abusing the smaller ones. The two-year olds are allowed to run about in an open court, which has an open shade which forms, generally, three sides of a square. The roof is water-tight, and the sides are built of stone. Their straw is put in a rack which is erected the entire length of the walls, and the turnips are simply pitched down to them in their entire state along the base of the wall. The bedding is particularly attended to, not only for the comfort of the animals, but for the purpose of making manure.

Scotch farmers are very particular to have their stables warm, well ventilated, and with plenty of light, to enable the animals to see what they are about. It is a fixed thing with them that it takes a certain amount of food to sustain animal heat; additional food goes to build up the superstructure; consequently, they must have their stock kept warm and clean. By following out these principles, they possess the

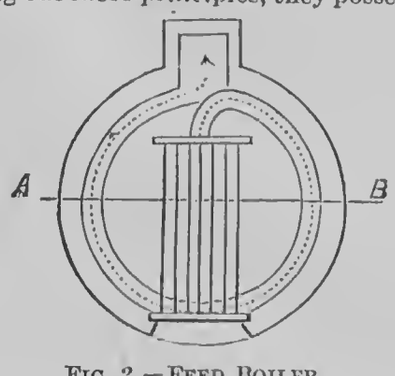

FIG. 2.—FEED BOILER.

power to control the condition of their stock, just as you can control the heat of the room you sit in.

Cooking on a large scale is rather expensive. It must be done with steam. The apparatus costs too much for most farmers. Still it is done on a great many model farms in England and Scotland. I have enclosed a rough sketch of a boiler which is used by every farmer in that country.

This boiler is used by farmers in Scotland; also by every well-to-do family, in the washhouse, for boiling clothes. Once, as a farmer's boy, I attended to them, and since I have been a mechanic, I have built probably one hundred of them. Twenty minutes of a good fire will set it boiling. This sketch represents one about three feet in diameter, capable of cooking a supper for eight horses. It is charged in the following manner:—A layer of chaff, bran and grain, and a layer of roots, alternately, until it is full; a little salt is added. Figure 1 is the ground plan; Fig. 2 shows the furnace placed and the direction of flue, which commences at the back of the furnace and makes a spiral circuit around the boiler and enters the chimney below the coping (see dotted lines); Fig. 3 is the elevation; Fig. 4, a section at the line A, B, in Fig. 2.

With this boiler the Scotch farmer has his horses in good condition all the year round. The top of the boiler is finished with a cut stone coping, about three inches

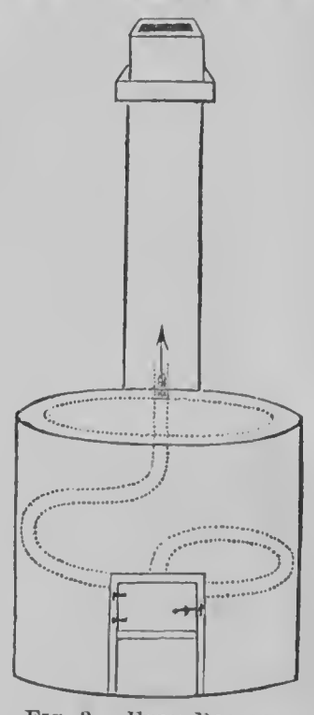

FIG. 3.—FEED BOILER.

thick, with an inch and a-half of projection, and a drip cut underneath, to clear the water off the brick work. An ordinary bricklayer can build one in a day.

NOTES FOR HERDSMEN.

To Fasten Cows Tails when Milking.—I have a method of fastening cows tails at milking time, which I never saw in use except by myself, nor described in print. It is this:—Take a No 13 or 14 wire and pass it through staples driven into the braces or joice over, and a little in the rear, of the cows, the whole length of the stable or milking barn. On this wire, as you put it up, place two or three small iron rings

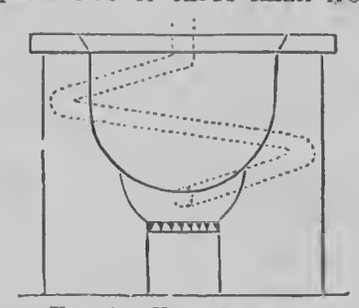

FIG. 4.—FEED BOILER.

between each two staples, and to them attach cords of sufficient length, which, with a hook made of the same sized wire, will raise the cow's tail on a line with her back; fasten the hook in the brush of the tail, and you can milk without having a cow's tail whisking about your face in fly time, or at any other time. Each milker should have two of these fixtures, so as to fasten up the tail of the cow behind him, if the animals remain in the barn till all are milked.—H., *Turin N. Y.*

Cows Bag "Sprung."—I have a fine cow, which I expect will have a calf some time this spring, but do not exactly know the time. One quarter of her bag has "sprung," and the milk flows as freely from it as that of a cow which has just had a calf. The other parts of her bag remain unchanged—she giving from this one quarter more than from all the other three teats. If any of your subscribers can tell me the reason of this, and will kindly do so, I shall be obliged to them. Let me add that she always milks up to the time of calving, and is giving at present about two gallons of milk a day.—D. C. R., *Atchison, Kan.*

Cows with Caked Bags.—As the season is at hand for new milch cows, and as there is more or less trouble in regard to their having caked bags, I thought that I would send you a remedy which we have used for many years, and have never known it to fail, in a single instance, of producing the desired effect. It is simply common soft soap applied to the parts affected, and thoroughly rubbed in with the hand. My father has used this remedy for many years, and generally found one application sufficient.—H. F. WOODWARD.

Lice on Animals.—The best exterminator of lice on any kind of animal, is fine sand or road dust put on the back from the head to the tail.—I. G. L., *Half Day, Ill.*

Devon Stock.—Where can Devon stock be found? I don't see it advertised.—C. P. R.

Pomological.

POMOLOGICAL GOSSIP.

Pears for Maryland, New Jersey and Pennsylvania.—The same correspondent asks for a list of twenty-five pears with the same merits for Maryland, New Jersey and Pennsylvania. We must give the best of those recommended for these States, at the same time and in the same manner as in the case of the apples:

For Maryland the following were recommended:—Bartlett, Belle Lucrative, Doyenne d'Ete, Flemish Beauty, Seckel, Beurre Bosc, Howell, Beurre d'Anjou, Beurre Clairgeau, Beurre Dell, Duchesse d'Angouleme, Lawrence, and Sheldon. The foregoing were recommended for Maryland as of great superiority and value; the following were recommended for general cultivation, but as not possessing equal merits with the foregoing:—Bloodgood, Buffum, Kingsessing, Rostiezer, Urbaniste, Beurre Dell, Doyenne Boussock, Onondaga, and Louise Bonne d'Jersey.

For Pennsylvania the following were recommended as of great superiority and value:—Kingsessing, Howell and Lawrence; and the following for general cultivation: Kingsessing and Seckel.

For New Jersey the following were recommended:—*Bartlett, Seckel, Buerre Bosc, *Beurre d'Anjou, Beurre Dell, *Duchesse d'Angouleme, Lawrence, and Beurre Clairgeau; those with * receiving the highest commendation.

Apples for Maryland.—A correspondent in Baltimore Co., Md., asks us to "furnish" a list of twenty-five apple trees (naming them according to merit and number of each), for home use, whose characteristics shall be hardiness, quality and size, and the best for keeping." Our knowledge of the fruits that thrive in Maryland is so limited that we can do nothing more than name the apples recommended by the representatives from Maryland at the meeting of the American Pomological Society at Richmond last September. They were:—American Summer Pearmain, Summer Queen, Carolina Red June, Summer Sweet Bough, Carolina Greening, Cannon Pearmain, Nickajack, Pryor's Red, Gilpin (on rich soil), Winesap, Rawles' Janet, Maiden's Blush, and London's Pippin.

Impulsable Strawberry is the somewhat singular name of a new strawberry obtained by M. MABILLE of Limoges (Haute-Vienne) from the seed of the strawberry Ananas du Chili, crossed with Trollope's Victoria, which is described as "a large continuously-bearing strawberry, which produces fruit as large as the English or American kinds, and continues to bear up to the first frosts." ED. ANDRE, in *L'Illustration Horticole* says:—"We do not hesitate to strongly recommend it, not only for its intrinsic value, but because it will, without doubt, prove the parent of large fruited and really continuously-bearing varieties superior to itself."

Strawberries in Rooms.—We saw, the other day, in the window of a lady's sitting room, four or five pots of strawbery plants, with fruit set, and blossoms upon them. She took young plants from the garden bed in October, put each in a 10-inch pot filled

FIGURE 3.

with good garden soil, watered them (occasionally with liquid manure), and will soon have a crop of strawberries of her own arising. They were Triomphes, and she will triumph with her early strawberries.

Ray's Victoria Grape.—Mr. W. R. SAMUELS of Clinton, Ky., in Nashville Union and American, claims to have originated a new grape—the Ray's Victoria—which he claims is adapted to all latitudes, localities, climates and soils. No other variety can compare with this, as it yields equally well in Northern or Southern exposures, in the bottoms or on the hills, upon sandy or clayey soils. This is what is claimed. But we have no evidence that it has been sufficiently tested to warrant such commendation for all localities.

The Vineyard.

BOTTLING GRAPES.

IN our issue, March 23, page 197, we gave an English Gardener's testimony as to the advantage of cutting grapes grown in cold graperies when they are ripe and bottling them, thus keeping them (in a dry room) from October to march. The room in which grapes are kept, must be guarded against damp, frost and artificial heat. In good weather fresh air must be introduced, and light as often as possible. In cold weather the room must be so nearly air-tight as to exclude frost without employing artificial heat. We copy from the Cottage Gardener, the accompanying illustrations showing how the grapes are stored. Fig. 1, is a standard, 6½ feet high, 2 inches square, into two sides of which alternately are set brackets 1½ inches thick, exposing, when adjusted, 4½ inches by 3½ inches of surface. Fig. 2 is the bottle receptacle which is laid on the brackets in Fig. 1. They are to rest perfectly level, and are made fast with a screw nail driven through the underside of the bracket into the underside of the bottle receptacle. A light facing of wood, fitted on the front of the standard rests upon the receptacle,

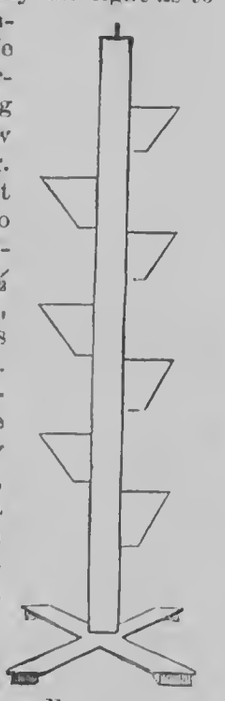

FIGURE 1.

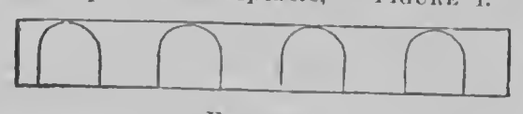

FIGURE 2.

and fits under each bracket, thus preventing the receptacle from rising up behind, and giving the whole a neat and finished appearance. Each pair of standards has seven 10-feet lengths of bottle receptacles, four on one side and three on the other, each length holding eleven bottles, so that each standard carries seventy-seven bottles. There are two laths of wood along the top of the standards, with holes in them the same distance as that at which the standards are placed, and bound together by means of an iron spike which passes through the holes. Fig. 3 gives a full sectional view of the receptacle containing the bottle. The testimony seems to be that pure rain water and charcoal are the best mixtures with which to fill the bottle, close to which the stalk of the bunch of grapes is placed, as shown in Fig. 3.

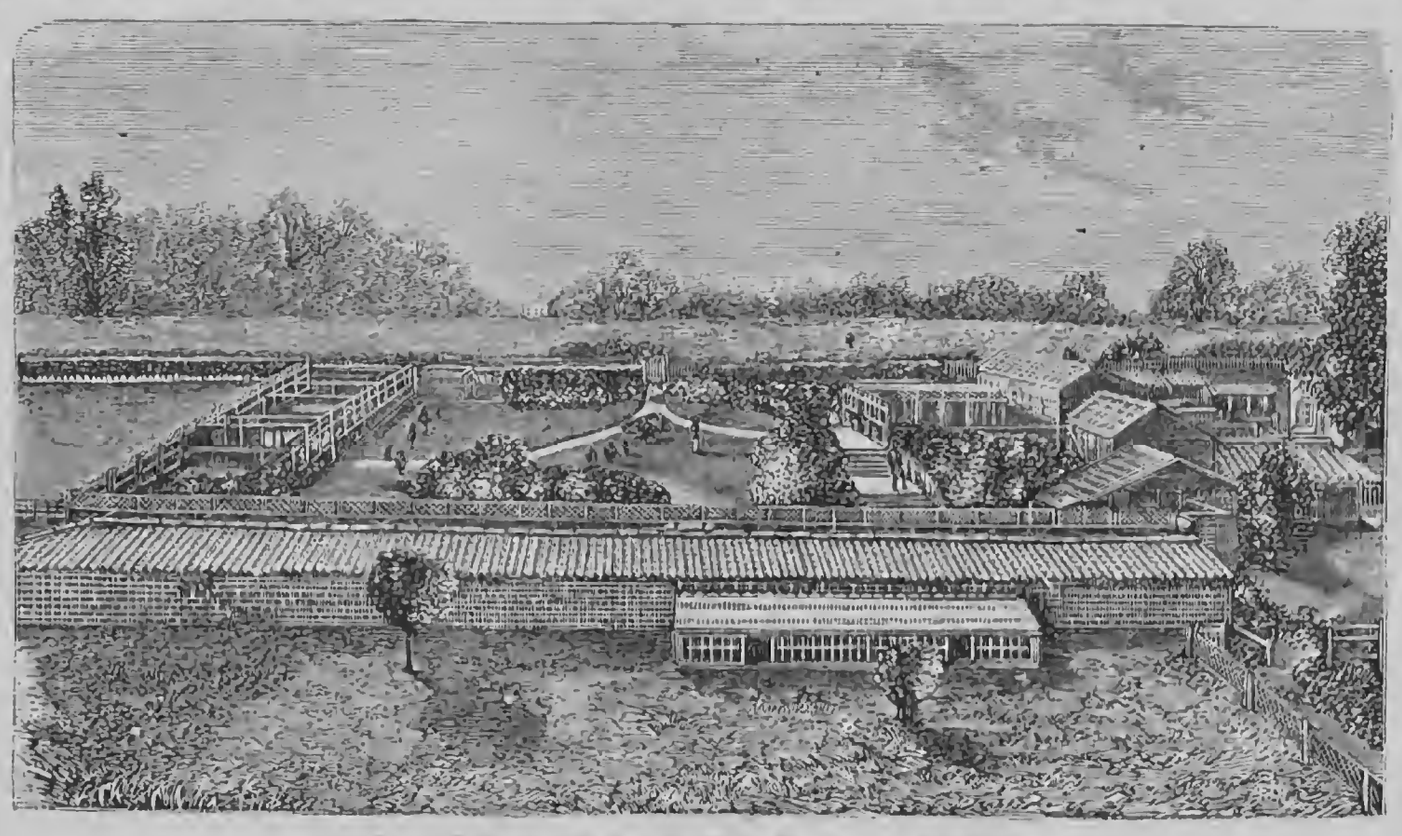
JOHN POTTS says the grapes should be cut as they ripen, and not taken off all at once, irrespective of their exact condition. Ten or twelve days before he cut any bunches, he went over all the vines in the Muscat house, when the foliage was perfectly green and healthy, and selected forty to fifty ripe bunches, the shoots of which he shortened to two eyes above the bunch, at the same time letting remain what small laterals there were attached to these eyes. By thus cutting back the shoots ten or twelve days before taking the bunches to the store-room, the use of sealing wax, or any other material, is dispensed with, as the shoots become perfectly hard and dry, and will neither take in nor give off moisture. He has the bottles prepared before hand, and after cutting the shoots off at the second eye, beneath the bunch, if possible, he carries the bunches with all the green foliage untouched, to the store-room and place them in their respective positions. The foliage should be allwed to die off of its own accord, after which it must be carefully removed.

Old Concord Wine.—A correspondent of the Rural World, having tested Concord wine of the vintage of 1865, says it had lost its foxiness, much of its color being now brownish yellow—bright, clear, smooth, agreeable, mellow.

The Poultry-Yard.

LADY GWYDYR'S POULTRY YARDS.

HEREWITH we give a picture of one of the most complete and largest poultry yards in the United Kingdom of Great Britain. The greater part of the immense range of buildings is built on the side of a small hill. The soil is very light and sandy, so that the drainage is unusually good; and no matter how heavy and continuous the rain may be, with the aid of the complete system of drainage adopted in all the yards, it passes away very quickly, leaving them free from water, which is carried into the valley below, there forming the duck ponds. A road running through the middle of the place divides it into two distinct yards—the show yard and the working yard.



STOKE PARK—THE SHOW YARD.

We describe the first of these, viz:—the show yard, of which our engraving gives a general view. On the right-hand side, by the tree, we obtain a glimpse of the manager's house; in the distance is seen the mansion belonging to Lord GWYDYR. On entering the yard through the gateway at the further side, and turning to the left, we find eight pens of various sizes, from 15 to 20 feet wide, and 25 feet long. The roosting places are in the sheds at the back of these runs. At the bottom are four more pens about 25 feet wide and 30 feet long. Only the backs of the sheds are shown in our engraving. On the other side are three large pens. At the top, in a large iron cage, we noticed a big shaggy, ferocious-looking dog; although he is kept in this iron cage, it is considered advisable to chain him.

The bottoms of all the runs are covered several inches deep with sand, and every morning a fine rake is drawn over this, removing anything that may have accumulated during the previous day. It keeps the pens clean, and gives them a neat and tidy appearance. In one corner, and under cover, is a dust bath, composed of old mortar and rubbish; quantities of this are eaten by the birds. Growing round the front and over the tops of these pens, which are only wire and open to all kinds of weather, are honeysuckles, roses, jasmines, and many other climbing plants, thus protecting the birds from the cold winds and the heat of the sun. The center, measuring about 100 feet by 80, is covered with grass; and hardy evergreen shrubs are planted in different places, affording shelter. The whole of this space is one large run, and the poultry in the houses round the sides get their run in rotation. Amongst the roots of these shrubs in the soft, sandy soil, the birds at the time of our visit were indulging to their heart's content in a bath, every one the picture of perfect health and enjoyment.

The grass runs, cleanliness, good food, regular and systematic feeding, and the attention which the birds enjoy, are seen in the splendid condition of every bird on the premises, all this care contributing in no small degree to the immense success which Lady Gwydyr's birds have achieved at almost every show throughout the kingdom. No matter how well any one's stock may be bred, unless these matters are attended to, the birds will be sure to sicken and die.

Vases are also distributed over the grounds and filled with geraniums and other flowering plants, and these, together with the many magnificent birds in their bright fresh plumage and graceful motions, make a very pretty and attractive picture, such a one as must often delight and gratify her ladyship and her visitors on inspecting the show yard.

POULTRY NOTES AND QUERIES.

Brahma Fowls as Summer Layers.—W. A. TALMADGE writes:—"In the fall of 1870 I purchased six pullets and a rooster—Light Brahmas. They began laying about the first of January, 1871. A correct account of eggs gave to April 3d 19 dozen. March 20th I set two hens and two again on the 29th of the same month; consequently in April my supply of eggs was small. I kept a strict account of their eggs for each month; and during the month of May they gave me 69 eggs; June, 108; July, 107; August, 83; September, 44. Add to the number obtained from January 1st to April 3d, as above, 228, and they gave from October 1st to October 1st, 639 eggs, or fifty-three and three-twelfths dozen for the year, besides raising forty chickens. Counting the chicks at half a dollar apiece, about the price of ordinary fowls, and making the average price of eggs at 18 cents per dozen for the year, these six hens paid for themselves, for all their feed, and for the feed for the chickens, for the year, and gave me a balance of $13.50.

Account With Barn-Yard Fowls.—Rev. WM. BROOKS, Erie Co., N. Y., had 10 of the common barn-yard fowls which laid in 1871, 1,484 eggs, from which were sold $22.33 worth; and from spring chickens (13) sold in December, $13.71; total, $36.04. Cost of keeping (which does not include the scraps from the table, sour milk, &c., but the amount actually expended for corn meal, corn, screenings, &c.), $9; leaving a balance of profit of $27.01, and leaving out of the account the eggs and some half dozen spring chickens consumed by two persons. The fowls had the range of the farm, good warm quarters, and were fed warm food—scalded meat, &c., two or three times a day. Mr. BROOKS believes feeding and care have more to do with success than the breed.

Houdans and Dorkings as Winter Layers.—WM. POMEROY writes that Jan. 1, 1872, he had eight Houdans and eight Dorking hens and pullets. During January the Houdans laid 45 eggs and the Dorkings 75; during February the Houdans laid 78 eggs; the Dorkings 107. Both breeds had the same care and keep. He adds:—"The Dorkings will have fits of sitting, you know; then perhaps the Houdans will overtake the Dorkings and outnumber them in the aggregate production of eggs."

Starting a Hen-Yard.—The correspondent who has "thought of starting a hen-yard" should buy the "People's Practical Poultry Book," for sale at this office (price $1.50), and study it carefully before engaging in the business. It will pay him to do so.

Male Canary Birds.—A correspondent asks whether a male Canary will sing as well after breeding as before. We know nothing to the contrary. Perhaps our readers do.

The Sportsman.

NOTES FOR SPORTSMEN.

Trapping Foxes.—In the first place, make your bed of ashes and put little pieces of meat in it; scent the meat first by burning it a little. The first night the fox will come and look at the bed. The second night he will come and eat the meat and paw the bed all over; then set your traps and you will have him. Care should be taken to smoke the traps, and not let the least bit of iron or anything be seen. After setting them, walk off an opposite way from that in which you came to set the trap. This is a genuine way of trapping foxes.—A TRAPPER, *Dell Prairie, Wis.*

Killing Moose in Maine, is, according to the Maine Farmer, prohibited by law between the 15th day of March and Oct. 1st under a penalty of $40, for each Moose killed. The average number captured during the past six years is estimated by experienced woodsmen to be about one hundred per year, which are killed chiefly on the head waters of the Aroostook, Allogash and Penobscot rivers.

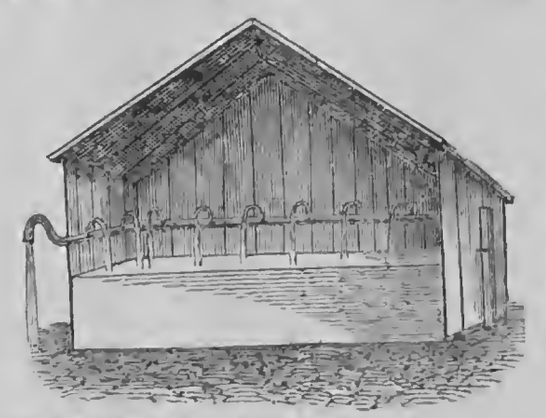
Farm Economy.

MAKING AND KEEPING ICE.

WE have frequent inquiries concerning ice-houses for the dairy, and for a cheap method of filling them with ice. A correspondent writes us that he is located a long distance from the river and finds it expensive to haul ice so far to fill his ice-house. He inquires whether he cannot utilize water from a spring on his farm by conveying it directly to the ice-house and allowing small quantities to freeze from time to time.

We have a communication from C. L. SHELDON, Esq., of Lowville, N. Y., which gives a plan for filling ice-houses cheaply. The late LYMON R. LYON of Lyons Falls, N. Y., adopted a plan similar to that described by Mr. S., and he informed us the method of filling had worked well for a number of years. We give Mr. SHELDON'S description, with accompanying illustration, as follows:

I have a high penstock just outside my ice-house; I connect a tin pipe about two inches in diameter, by means of a hollow plug, with this penstock, making a hole through the siding for that purpose. This tin pipe may pass through the center of the ice house, or it may be fastened to the side walls, passing partly or entirely around. If passing through the center, conical tubes similar to the nozzle of an oil can, about an inch in altitude, should be soldered on either side of the tin pipe so as to discharge jets at an angle of about thirty degrees to a perpendicular. If passing around the sides, cones should be so soldered as that the jets shall be thrown inward. The aperture through the apex of these cones should be very fine, about the size of a small pin. At the discharge end of this pipe, passing through or around the ice-house, should be fastened a rubber pipe of four to six feet in length. By raising the movable end of this rubber pipe we give whatever head we desire to the jets; in severe cold weather the



METHOD OF FILLING ICE-HOUSE BY JETS OF WATER.

greater head, and as the weather moderates less. Should it be thawing, or too mild to freeze, then lower the rubber pipe so that the water will flow through the pipe without being discharged from the cones; for this purpose the pipe should have a gradual descent toward the discharge end. Should this not effectually prevent any water flowing on the ice, then bore a hole in the penstock below the pipe passing through the ice-house, and let the water discharge from this hole during mild weather.

The jets may be within two feet of each other; better results attend a large number of fine jets than a less number, discharging the same amount of water.

In starting, the bottom of the ice-house should be covered with sawdust, or other suitable non-conducting substance. The ice will form very slowly at first, but after the bottom is covered it will congeal more rapidly. After a sufficient quantity of ice has been formed, the sawdust may be put on, covering thickly around the edges, so that as the ice melts the dust will fall down and protect it.

Ice formed in this way will keep better than if sawed and packed in the usual way; yet there is more waste and trouble in getting it up for use.

The 800 cubic feet of ice that I now have in my ice-house, has not cost me over one day's labor all told; and the first cost of fitting up was less than five dollars. Taking into consideration the trifling cost of filling an ice-house, and the better conditions for keeping, I consider this mode of saving ice worth a practical test by all who have running water and sufficient fall.

ABOUT FARM TOOLS.

FOR some time I have thought to give my views on the above topic, or rather to point out what I deem a radical defect in the construction of agricultural machinery and implements. And a late visit to the extensive Steel Works of SWEET'S MANUFACTURING CO. (Syracuse, N. Y.,) has determined me on the point. I was agreeably surprised to find this Company turning out a new style of steel crow-bars and harrow teeth by the ton. The fault with farm tools generally is they are too heavy; and this firm, alive to this truth, are using steel instead of iron, and with extended facilities are enabled to supply all demands with an article quite as strong, more convenient, of about two-thirds the weight, and at about the same cost as the old clumsy iron ones.

As I said before, our tools are too heavy, and one, perhaps the chief, cause of this lies in the fact that many of the makers of these goods are not, in fact, real mechanics; they do not discriminate where the strength is really required, or where weight may be dispensed with; an inability on their part to properly adapt means to ends is what fills our tool houses with machines of doubtful utility. There is also a class of tool makers, as in other branches of mechanical art, who have a great desire to see their names in large letters on a piece of parchment in company with the words "Letters Patent"—and, without taxing their skill to produce something new and really useful, they take advantage of what has been done, and by a different combination of mechanical movements, alter some old machine until there are no outside features of it left, and then claim a patent for an improvement. In the mean time what should be the grand object—to get up a new and better implement—is lost. Our back-yards and sheds are littered with tools usually stamped *Patent*, which have been thrown aside just because the maker *did not know* where to make them strong, and where weight and expense might be dispensed with. YORICK.

ECONOMICAL NOTES.

A Cheap Way to Make a Well, is to use plaster instead of stone. I have tried it with success. Dig and stone to the depth of six feet, making the shaft, when stoned, four feet in diameter. Then dig and plaster with good water-lime as you go down. By stoning you get below the effect of frost before you commence plastering. One barrel of lime is sufficient to plaster a shaft 40 feet deep. Such wells are easily cleaned, and there are no crevices in which reptiles can secrete themselves or lie and decompose in the water.—GEO. W. TRIPP, *Columbus, Wis.*

SUCCESS will depend much on the character of the soil, we should think.

Advantages of Underdraining.—The Massachusetts Ploughman sensibly says: "One important advantage of the underdrain is, that it is at work when the top of the ground is frozen, when, of course, a surface or open drain is inactive; thus making the subsoil so dry and porous that when the frost comes out of the water it drops through at once and leaves the ground dry.

Castor Bean Pomace.—What is its value as a fertilizer? What should it be mixed with, and how much used per acre?—H. S., *St. Louis, Mo.*

WILL not some of our readers who have used it give their experience?

Dairy Husbandry.

VALUABLE STATISTICS CONCERNING BUTTER-MAKING

How Much Milk Required for a Pound of Butter.

NOTWITHSTANDING the great increase in dairying during the past ten years, and the introduction of butter factories, very few statistics have been given showing the quantity of milk required for a pound of butter, as an average, for the season, from a large number of cows. We have numerous statements, from time to time, showing what the milk of a single cow will yield in butter for short periods, and at different seasons of the year. These statements are generally quite unsatisfactory, inasmuch as the milk from cows of different breeds, and from different cows of the same breed, varies greatly in quality. Then again, the distance from the time of calving, feed of the cows, and other circumstances, have so much influence that most of the records showing the quantity of butter made during brief periods cannot be taken as a safe guide for the average yield of a herd of cows during the season. The question of setting milk deep or shallow, is one upon which dairymen still differ in opinion. One man gets more butter for a week by deep setting, and another by shallow setting. Nearly all these experiments are unsatisfactory, because they have not been continued long enough, and most of them are worthless, because they have been badly conducted, or have been made by persons so strongly prejudiced in favor of the one or the other system, that accurate and reliable results cannot be had from them.

The question is constantly occurring, "How many pounds of milk are required for a pound of butter from an average herd which is kept in the ordinary way during the season?" The cheese factories seem to have settled the question that it takes on an average about ten pounds of milk to make one pound of cured cheese, one season with another. Some factories, it is true, report a little better result than this, but it is generally understood that no cheese maker would be warranted in buying milk to be made up into a good "shipping cheese" on a basis of anything less than the ten pound average. What the dairy public now desires to know is the number of pounds of milk required for a pound of butter, when the herds are similar to the cheese dairying herds, and have similar feed and treatment. If we can determine with any degree of accuracy this question, dairymen will at once be able to tell whether there is more profit in turning milk into cheese or into butter. We have statistics from the creameries of Franklin county, N. Y., which we regard as of great value in helping to solve this problem of "how much milk to the pound of butter."

In Franklin county the creameries use the Jewett Pan, and the temperature of the milk is kept uniform by means of cold water flowing under it. The statistics of the factories referred to represent yields from comparatively shallow settings. If some of the Orange county factories, or factories which employ the pool and pails, will furnish us statistics showing the average from deep settings during the season, the merits of the two systems may be very satisfactorily compared and summed up.

L. B. SPERRY of Malone, N. Y., Secretary of the Berry butter factory, reports as follows:—Factory commenced receiving milk 21th May, and closed Oct. 28th, 1871; whole number pounds of milk received, 425,988; pounds of butter made, 16,931. Thus showing a fraction over twenty-five and one-tenth pounds of milk to the pound of butter. Sales of butter averaged a little over thirty-one cents per pound.

S. W. DICKERSON of the Moria butter factory, reports as follows:—Factory commenced operation 23d May, and closed Sept. 16th, 1871; whole number pounds of milk received, 348,263, which made 15,056 pounds of butter, being an average of one pound of butter from 23⅛ pounds of milk. Milk set in Jewett pan, about six inches deep, and kept at temperature of 60° to 62°—except in hottest weather, when it went up to 65°; used dash churn and salted butter at rate of one ounce salt to one pound butter; sales of butter were made at 30c.

P. W. SHIELDS, Treasurer of the Keeler butter factory, reports that the factory commenced taking in milk June 27th, and closed Oct. 22d; the whole quantity of milk received amounted to 152,829 pounds, which made 7,387 pounds of butter, or an average of one pound of butter for twenty and five-sevenths pounds of milk; set milk five inches deep in Jewett pan; churned with revolving barrel churn; salt at rate of one ounce to the pound, and sold butter on an average at 31¼ cents per pound at the factory.

The Union factory, of Bangor, N. Y., reports 96 days' milk, amounting to 233,161 pounds, and 9,522 pounds of butter sold, making an average of 24½ pounds of milk for a pound of butter.

The Cold Spring factory, of Malone, reports 441,267 pounds of milk received, and 19,776 pounds of butter made, or one pound of butter from 22 31-100 pounds of milk.

The Borley Spring factory, of Chautauqua, reports 270,811 pounds of milk for 12,012 pounds of butter made, or 22 55-100 pounds of milk to one of butter.

These statistics are of great interest and value. From them we learn the fact that herds of our common cows at pasture, with no extra attention to feed above that usually given to herds in the cheese-dairying districts, produce milk that has yielded, as an average, for the season, a pound of butter from only 20 5-7 pounds of milk. Again, that the average of five factories is only 22 6-10 pounds of milk required for one pound of butter. We have taken the average of the five factories last in the list because the first one named was troubled with defective water, which the manager thought lessened the yield of butter, as the milk could not be held at the proper temperature.

If we assume that 22 pounds of milk will make a pound of butter which sells at 31c., then butter-making at factories is a little better than cheese making when cheese sells for 14c. per pound, to say nothing of the difference between the value of the skimmed milk over the whey.

We should judge, from these statistics, that 22 pounds of milk for a pound of butter may be as safely taken as an average at butter factories, as 10 pounds of milk for a pound of cheese at cheese factories. It will be observed that the early closing of the factories has considerable influence on per centages. The milk in the fall and early winter is rich in cream, and if these factories had continued their operations up to January, as is the case with many cheese factories, we have no doubt the quantity of milk for a pound of butter would have been reduced to near 20 pounds.

We shall be glad to receive further statistics from the butter factories. Such reports as those we have given are of very great importance to dairymen, because they establish something definite and reliable from which a basis of profits may be estimated by those who propose to enter upon this business.

CONDENSED MILK.

I WOULD like a little information on the subject of condensed milk. I want to know where there is an establishment for condensing milk; what such milk is worth in market; what amount of milk it takes for a gallon of condensed milk; what would be the expense of an apparatus, etc.—WILLIAM SHELDON, *Oswego C., N. Y.*

1. THERE are two or three establishments for condensing milk on the Harlem Road. The one at Brewster, N. Y., is under the management of Mr. JOHN GAIL BORDEN, who is a son of the inventor of the process for condensing in vacuo.

2. The sugared condensed milk sells in market at from 28 to 30 cents per pound. the plain condensed milk at 30 to 40 cents per quart.

3. It takes four gallons of milk, as it comes from the cow, to make one gallon of plain condensed milk. In other words, three-quarters of its bulk in water being evaporated.

4. A factory with suitable apparatus, etc., complete, will cost from $10,000 to $15,000. Some of the factories, with apparatus, etc., have cost as much as $50,000.

DAIRY NOTES.

Churn Power.—Please tell the readers of the RURAL NEW-YORKER that a nearly worn-out reaper or mower gearing, set up edgewise, and strongly staked down, makes a good power for churning. Put a pole on the driving-wheel (by means of a wire or chain) to hitch the horse to, and another pole, notched in the end, for a tumbling-rod. Have a post on the outside for the lever to work on, and you have just the *thing* right—motion and all—for churning without back-ache or arm-ache. I have used one for two years, in this way, and like it.—J. O. A. B., *Morrison, Whiteside Co., Ill.*

Horse Power for Churning Wanted.—I would like to get, this spring, a power for churning—not a tread power of any description, but a sweep power to be run by a horse. Will any of your readers let me know where they can be had, or will the manufacturer advertise?—A. KING.

Diary of a Ruralist.

DAILY RURAL LIFE.

FROM THE DIARY OF A GENTLEMAN NEAR NEW YORK CITY.

Write a Book.—*March* 18.—Yes; this is what some of my supposed-to-be friends advise. But I remember that old saying, "Oh! that mine enemy had but written a book!" and fearing that a good many would take me for one, and tear my work in pieces, I must decline the honors of an author at present. There seem to be but two kinds of books that pay their authors anything handsome for the labor. In one case the remuneration comes in cash, and the other in honor. The most useful and beneficial kinds merely bring honor and very little cash, and that is poor encouragement to those who have the good of mankind at heart. If I were to write a book it would certainly be on some rural subject requiring considerable study and a long series of experiments, involving considerable expense in time and money. So far as the honor of the thing is concerned, it is all very well to write such a work as Hoopes on Evergreens, Thomas' American Fruit Culturist, or Downing's immense Cyclopedia of Pomology, but no man who has had any experience in these departments of horticulture believes that the authors ever have, or ever will, receive one-tenth of what their works cost them. To collect the required information to write such works costs more money (to say nothing about the requisite study and labor of writing) than any author ever received from his publisher. The same truth holds good in all departments of science, simply because the masses prefer something more easily digested than wisdom.

Grafting Geraniums.—*March* 19.—Many of the new Zonal geraniums are wonderfully slow growers on their own roots, requiring two or three years to obtain a good, showy plant. Among the plain-leaved sorts there are plenty of strong, vigorous growers. I am using these for stocks upon which to graft the more delicate kinds. Grafting geraniums has been practiced but very little in this country, but I think that when our gardeners learn its value, it will be extensively used for the slow growing but elegant Zonal varieties. Even for the purpose of obtaining a supply of good strong cuttings, grafting the weaker sorts upon the stronger will be found of considerable value to the commercial florist.

A Visit to Rutgers College.—*March* 20.—A few minutes ride on the cars to-day brought me to New Brunswick, N. J., where the old Rutgers Scientific School or College is located. This famous old school having received the funds apportioned to the State by the general Government in aid of agricultural colleges, it is now supposed to teach agriculture as well as theology, the latter being the principal object of its founders. A farm has been purchased, and, under the management of Prof. GEO. H. COOK, who is a practical as well as scientific agriculturist, it will no doubt soon be worthy of a visit by the farmers of New Jersey and adjoining States.

I presume that the students of Rutgers College will have the privilege of walking over the farm and looking at the big Short-Horns and Long-Horns, and perhaps see how some strong Celt can hoe beets and potatoes; but I have my doubts in regard to any college student trying to learn how to get a living by tilling the soil. Boys generally go to college for the purpose of becoming lawyers, doctors or ministers; and if they fail in this, perhaps some kind of manual labor will be taken up as a *dernier* resort.

When one looks over the course of study mapped out for the students in any of our colleges, agricultural as well as others, it is no wonder that so few are ever able to get an honest living by the sweat of their brow or use of their brains. Their heads are crammed full of old fossiliferous nonsense, for which they have no more use in the voyage of life than a dog has for a fish-hook and line. Rutgers College is as good as the general run of such institutions, and probably better than some that could be named, but, I ask, in the name of common sense, and the good of mankind, when will the educators of men and women learn that every child is not cast in the same mold, nor fitted for the same position in life? Why should every young man or woman be compelled to pursue the same course of study in order to graduate with college honors? Our greatest men are specialists who have studied one subject thoroughly, instead of spending their time endeavoring to grasp that for which they had neither capacity or natural inclination. It certainly speaks well for the youth of our country that so few are ruined by the present system of education, which tends to suppress natural talent and make them mere machines to do the bidding of others. They are taught to absorb the ideas of others as a sponge does water, and not to create, remodel and progress.

Domestic Economy.

SELECTED RECIPES.

Orange Chips.—Cut your oranges longways, take out all the pulp, and put the rinds into rather strong salt and water for six days, then boil them in a large quantity of spring water until they are tender; take them out, and lay them on a hair sieve to drain, then make a thin syrup of fine loaf-sugar (one pound to one quart of water); put in your peels, and boil them over a slow fire till you see the sirup candy about the pan and peels, then take them out and grate fine sugar over them. Lay them on a hair sieve to drain, and set them in a stove, or before the fire to dry. Lemon chips or candied peel may be made in the same way.

Rosie's Raised Cake.—Three cups bread-dough, two cups sugar, one cup butter, or half cup butter and half cup lard, two eggs, nutmeg to suit the taste, one wine-glass of wine, half a teaspoonful of soda, one pound of raisins chopped or stoned; beat all thoroughly together, and let it stand to raise till quite light. Always roll raisins in a plenty of flour before putting into the dough to prevent their sinking. We know Rosie's cake is excellent, for we have often been favored with it. And, also,

Rosie's Sally Lunn.—One spoonful of butter, one of sugar, one egg, one pint of milk, one quart of flour with two teaspoonfuls of cream of tartar sifted with the flour, and one teaspoonful of soda added the last thing. This is an excellent breakfast cake, as well as tea cake; and is sometimes varied by stirring in a pint of whortleberries.

Truffles au Vin.—Take some good-sized fresh truffles, wash them perfectly clean, put them in a saucepan with a pod of garlic, a bundle of sweet herbs, and pepper and salt to taste; fill up the saucepan, so as to cover the truffles, with some very good stock and white wine in equal parts. Let them boil gently till done, and serve dry in a napkin.

Truffles a l' Italienne.—Lay some truffles cut in slices in a dish that will stand the fire; strew over them some parsley and shalot finely minced, some pepper, and a little salt; pour some olive oil over them, put them in the oven, covered close, for a quarter of an hour or twenty minutes, and when done squeeze the juice of a lemon over, and serve.

Truffles Sautees.—Put some butter in a saucepan, and some truffles cut in slices; toss them for five minutes, then moisten with a glass of sherry, and add pepper, salt, a little powdered nutmeg, and a small piece of glaze; let them stew gently till done. Serve with sippets of bread fried in butter.

Orange Salad.—Peel eight oranges with a sharp knife, so as to remove every vestige of skin from them, core them as you would core apples, then cut them in slices, and lay them in a deep dish; strew over them plenty of powdered loaf-sugar, then add a large wine-glassful of pale brandy; keep the dish covered close till the time of serving.

ODDS AND ENDS.

Cracked Wheat.—Immediately after breakfast put a kettle of water to boil, with a steamer above, placing therein a two-quart tin vessel, half full of cracked wheat, a tablespoonful of salt, and water enough to cover. Allow it to steam all day (with less time it tastes raw); add hot water occasionally, just enough to keep the cracked wheat covered; it will swell double. Allow it to stand till cold, then turn it on a plate; serve at any meal, with cream and sugar. For the sake of hygiene I have, at every meal, cracked wheat, Graham, oat-meal or samp.—MONA, *Titusville, Pa.*

Graham Bread.—Stir into two quarts of blood-warm water enough Graham flour to make about the consistency of pancakes; add half a pint of yeast and a tablespoonful of salt; allow it to stand all night in a warm place; early next morning add two cups of common molasses and stir in enough flour to make about as thick as for cake—not good if too thick; at ten o'clock put into deep buttered tins (about four), set in a warm place to rise; in two hours it will be light enough. Bake one hour.

Does Gypsum Injure Land.—JOHN LABEW asks if gypsum injures land. No. We have used it, and know farms upon which it has been used thirty years. It does no injury that we know or can conceive of.

To Prevent Maple Molasses Crystallizing.—After having hermetically sealed it, shake it thoroughly before setting it away, and it will never crystallize.—P. H. K., *Farmington, Pa.*

The Literary World.

NEW PUBLICATIONS.

The Amateur Microscopist. By Prof. JOHN BROCKLESBY, A. M. New York: William Wood & Company.

A HAND-BOOK of microscopic manipulation and microscopic objects, like the present one, has long been needed and will be welcomed by all who are learning to use the wonderful instrument. This handsome little work contains 247 illustrations, and contains much matter of interest to the general reader, as well as the microscopist. Intended for the Amateur, it meets a long felt want, and will be eagerly sought after.

An American Girl Abroad. By ADELINE TRAFTON. Boston: Lee & Shepard.

THIS neat, illustrated volume, is very sprightly, sparkling, and amusing. Being readable, the reader will follow the wanderings of the American girl in London, Paris, Berlin, through Holland and Switzerland, with a rare relish. She seldom gives details of the things she saw, but woman-like, seizes upon many points we all like to read about, skipping from one to the other with great freedom.

Poor Miss Finch. By WILKIE COLLINS. New York: Harper & Bros.

THE writings of this author are well known and popular in America. Since the death of DICKENS, COLLINS is the best living story-writer we have. "Poor Miss Finch" is as interesting as any of his romances, and will afford entertainment to all who read it. Some day we hope to see American authors produce romances equally as interesting.

The Adventures of Oliver Twist. By CHAS. DICKENS. New York: Harper & Brothers.

THIS handsome edition is called "The Household," and has 28 illustrations by J. MAHONEY, which are new, and very good. The book is beautifully printed in wide, two-column pages, and handsomely bound in green and gold. Those who think of buying this very fascinating story cannot do better than get it in the form here announced.

A Slaver's Adventures on Land and Sea. By W. H. THOMES. Boston: Lee & Shepard.

A LARGE book for young folks, of over 400 pages, written in the form of a narrative, and profusely illustrated. It is decidedly sensational, and will be relished by many who love to read of an exciting life of adventure. The tone of the book is a little too loud for most families, and stronger than we wish it was when it treats of doubtful subjects.

Twenty Years Ago. Edited by the author of "John Halifax, Gentleman." New York: Harper & Bros.

THIS is a book for girls, being the journal of a girl in her teens, kept while living in Paris. It tells, in a pleasing manner, much about Paris—its society, its parks, etc.; and the story of the *coup d'etat*, as it appeared to a young English girl, is told. Readers of this book will find much in it to please and amuse.

The Heroines of History. By JOHN S. JENKINS. Hartford, Conn.: S. M. Betts & Co.

THIS large and handsome subscription book of over 500 pages is very interesting to read, and contains well-written sketches of Cleopatra, Isabella of Castile, Joan of Arc, Maria Theresa, Josephine, Elizabeth of England, Mary of Scotland, Catharine of Russia, Marie Antoinette, and Madame Roland.

A Crown from the Spear. Boston: James R Osgood & Co.

A SENSATIONAL French novel, full of convents, cathedrals, priests, archbishops, etc., by the author of "Woven of Many Threads." If one desires to read the story of a little waif, this book will give it to them. The style is sprightly and will suit many readers. Price, 75 cents.

Kate Beaumont. By J. W. DE FOREST. Boston: J. R. Osgood & Co.

MR. DE FOREST is an American writer of more than usual interest, and his stories have found many readers in our magazines. Those who have formed his acquaintance there will be glad to read the story of "Kate Beaumont" in book form.

Young America Abroad. By OLIVER OPTIC. Northern Lands. Boston: Lee & Shepard.

ANOTHER one of those chatty and interesting books from the pen of OLIVER OPTIC. This volume takes the reader through Prussia and Russia, and treats of much which will amuse and instruct all young readers, be they boys or girls.

The Boston Transcript has just got into its new and elegant building on Washington street.

New Publications.

MASON & HAMLIN'S
Cabinet Organ Method,
By EUGENE THAYER.
PRICE.....$1.50.

Why pay Two or Three Dollars for a method, when you can obtain the Mason & Hamlin's method which is far superior in every respect, for $1.50.

Charming Song. Illustrated Title.

CORN CORN CORN CORN CORN CORN CORN CORN CORN

The Best and Most Productive Variety in the World for Field Culture.

How this Variety of Corn was Originated.

This celebrated variety has been brought to its present perfection by planting largest, most prolific and earliest kinds for a series of years and annually selecting the earliest ripening, largest and most prolific ears for seed.

120 to 150 Bushels of Shelled Corn Grown Per Acre.

In order to show that it is NO HUMBUG, we have put up 500,000 small SAMPLE PACKAGES, which we will send FREE to all who send *stamp* to pay postage.

What we Claim for the Chester County Mammoth Corn:

The important points of superiority claimed for this corn over other varieties, and which are fully sustained by the voluntary statements of farmers who raised from seed got of us last year, are these:

1st. This corn will yield from twice to three times as many bushels to the acre on the same soil and with the same culture.

3d. The stalks grow more vigorous and healthy, and sufficiently strong to produce one or two very large ears.

4th. The stalks bear more foliage and is better for feeding.

5th. That it will grow and produce a profitable crop on ground where other corn will not grow to maturity.

6th. It ripens earlier and is not liable to be caught by frost.

7th. To be cut green and used for feeding, it is fifty per cent. better than any other variety of corn.

Our corn has all been selected with the greatest care, the small end of every ear broken off, the balance shelled by hand.

We Warrant Every Grain of it to Grow.

The increase yield per acre over the old varieties will pay for the seed twenty times over, besides every farmer that plants this year will have a large demand for seed at good prices. SEND FOR CIRCULARS AND TESTIMONIALS.

Price $2.50 per peck; $5 a bushel; five bushels $20.
Address N. P. BOYER & CO.,
Parkesburg, Chester Co., Pa.

Business "	2.50	"
Reading "	3.00	"

☞ No advertisement inserted for less than $3.

SATURDAY, APRIL 6, 1872.

THE RURAL'S SPRING CAMPAIGN!

A NEW QUARTER,

AND A GOOD TIME TO SUBSCRIBE!

Agents and others interested, are reminded that a New Quarter of the Rural New-Yorker commences *this week*—April 6th—affording a good starting point for all who wish to take the paper. We hope that not only all our Club Agents, but every Subscriber also, will bear this in mind, and kindly see what may be done toward increasing our circulation among those who would be benefited by taking the Rural. The season is at hand when thousands who do not now take it will want to consult the pages of this Journal concerning operations in Garden, Orchard and Field, and we ask those who know its value to introduce it to notice and support in their respective localities. Those forming new clubs, or making additions to old ones, will be entitled to the same Premiums offered in January—so that all aiding the Rural will not only have the consciousness of doing good to others, but be liberally rewarded therefor.

All non-subscribers who receive this number of the Rural New-Yorker—and we mail it to many who have recently written for specimens, as well as to numerous other persons—are requested to give it a careful examination, and, if approved, encourage the circulation of the paper among their neighbors and other acquaintances. Those thus receiving the paper, together with the necessary documents to aid in forming clubs, will especially oblige us by referring the matter of obtaining subscribers to some friend who will give it attention—provided they cannot themselves act in the premises. There are thousands of localities where clubs of from five to fifty subscribers may be readily formed if the stranger-friends addressed in this paragraph will kindly lend their influence in that direction at this opportune season. How many will do us and their neighbors the favor to give the matter TIMELY ACTION?

THE SPRING OF 1872.

The Winter of 1871-2 has been remarkable for its uniform cold in all portions of the country, for its heavy snows in some sections, its tornado-like winds, the absence of snow in some of the snowy regions, the general drouth, sudden changes where the weather is ordinarily equable. The Spring is a late one. Its coming is reported to be two to six weeks behind time in a wide range of localities. Not in many years has there been so much frost reported in the ground at this season as now. The winter grains, in the regions where most cultivated, have suffered seriously from exposure to drouth and cold, exhausting the vitality of the plants and necessarily affecting the prospective profits of the husbandman. Work in the fields is to come "all in a heap." This fact must affect the breadth of land planted and sown, unless a greater proportion of fall plowing was performed than we have reason to suppose.

Naturally, all consumers, and all interested in handling produce, look with anxiety for what the season is to bring forth. A small per cent. decrease of production of any crop in all parts of the country affects the aggregate seriously. And values are proportionally affected. The old advice, "plant one acre more," is the advice consumers will give. We advise planting liberally so far as it can be well done. The ground, as soon as the frost leaves it, will be in excellent condition for culture—especially where a small per cent. of rain has fallen. The action of the frost pulverizes the soil. The seed once sown, with the soil in this dry condition, spring rains and sunshine will give it a quick start. But will it "catch up?"

We need not advise men who depend upon the products of the soil to be active; that would be insulting to their intelligence. We need not urge that prosperity depends upon production; that is self-evident. We need not prophesy decreased production, and, therefore good prices; that would be presumptuous. But we may express the opinion that, so far as we can judge, there was never greater reason for diligence in improving the short seed time than this Spring of 1872.

RURAL NOTES AND QUERIES.

Not a Patron of Husbandry.—The Western Rural, March 9th, in an article defining its position relative to the Patrons of Husbandry, says: "It is stated that a leading editor of the Rural New-Yorker is (or was) an officer of the Patrons." It is only just to the Patrons of Husbandry, and to ourselves, to say that not "a leading editor of the Rural New-Yorker is (or ever has been) an officer of the Patrons," nor even a member of the Order—at least, we know of no one who is or has been. Certainly, none of the office editors have held such position. We have full sympathy with the organization just so far as it aims to elevate the agriculturist, and promote agricultural progress. We have no sympathy, however, with any class of men who, failing to gain promotion and power otherwise, use their positions in this Order to lift themselves into places which they could not obtain otherwise, and for the discharge of the responsibilities of which they are not qualified. The Order may, by virtue of the power of combination, do great good: but that power may also be used by scheming and ambitious men, to foist themselves upon the people, to the detriment of the general interests of agriculture and agriculturists. We hold the position of dispassionate, independent, and impartial observers, and shall not hesitate to commend whatever good we may discover resulting from this organization, and to denounce such as, in our judgment, have an evil tendency. In other words, we intend to do the Order justice, no matter in what direction it may lead us.

Manufacturing Patented Articles.—H. Robinson, Allegany Co., Md., writes:—"Can I make an article for my own use (that is patented) without infringing on the right of the patent? I have been using an *ink* in my trade for a number of years, composed of certain ingredients. Now a man comes along with the same to sell—the recipe *patented*, and tells me I must discontinue its use or be prosecuted according to law.' *Was* the ink patented? Did he show you letters patent? Was the date of the patent (if it was patented) prior to the date of your first using it? Can you *prove* you used it before it was patented? We ask these questions because articles labeled "patented" are not always patented. If it was patented and you can prove that you had used it prior to the date of his patent, his claim against you, in a court of law, will only be nominal. If you can prove that you *invented* the ink before he did, his patent (if he has one) is void. If your ink is not composed of precisely the same ingredients and in the same proportions, substantially, as his patent sets forth, he cannot recover damages of you for its use. If a single ingredient which he uses is not used by you, he cannot touch you. If the use of the ink is of sufficient importance to you, we advise you to write to the Commissioner of Patents at Washington for a copy of the patent and the date of the application. You can then act intelligently in the matter.

A Boy who wants to Run Away.—A Connecticut boy writes:—"I am ambitious of becoming an artist—a painter; but here I have to stay plodding on the farm. It almost drives me mad some of the time. I make some drawings nights and rainy days, when I can get the chance. I feel sometimes just like running off. I will be of age in four or five years. Please tell me what to do; or at least advise me a little." We say study nature, and discharge your duties to your parents by remaining on the farm until you are of age, unless they are perfectly willing you should leave them to pursue your art studies. As an artist, you cannot be too thorough and critical a student of nature in all its forms and phases. If you are a true artist, every day you will fix permanently in your mind some picture to be reproduced hereafter with your pencil and brush. Correspond with, and ask suggestions of, any good artist to whom you may have access. Act, so far as you can and discharge your daily duties faithfully, upon such hints. But remember that no true artist can obtain too intimate and critical a knowledge of nature. The farm, and the four or five years you have to stay there, will afford you opportunities for this kind of study, and which ought to absorb your whole mind, and render you contented.

Advance in Number and Price of Sheep.—In some of the States, according to Statistician Dodge's last report, there has been an increase in flocks the past year: In Vermont, 6 per cent.; Texas, 9; Arkansas, Michigan, Wisconsin, Kansas, and Nebraska, 25; California and Oregon, 16 per cent. There has also been some increase in the Territories. The following is the advance in the average price of sheep, not less than one year old, since February last: Vermont, $2.75@4.56; New York, $3.37@4.32; Pennsylvania, $3.45@3.70; Ohio, $2.49@3.37; Michigan, $2.45@3.14; Illinois, $2.15@2.90; Iowa, $1.88@2.41; California, $2.84@3.08; Texas, $1.59@1.73. The Southern States have few sheep, and have not felt the appreciation materially.

Catalogues, Etc., Received.—From Upton, Shaw & Co., Brighton, Mass., circular concerning the Brighton Bone-Phosphate and Dry Super-Phosphate of Lime Ammoniated with Gelatine....From Furnas & Sons, Brownville, Neb., Descriptive Fruit List.... From L. L. Dorsey, Eden Stock Farm, Jeff. Co., Ky., Pedigree and Description of High-Bred Trotting Stallions, Geldings and Mares for sale at auction, May 1....From Edward J. Taylor, Waterloo, N. Y., Price List of Eggs for 1872 .. From W. H. Lockwood, Hartford, Conn., Price List of Fowls and Eggs....From Adriance, Platt & Co., Descriptive Catalogue and Price List of Buckeye Mower and Reaper.

Practical Dairy Husbandry.—This work, by X. A. Willard, editor of our Dairy Husbandry Department, is receiving high commendation from the press. The agricultural journals, especially, speak of Mr. Willard and his exhaustive treatise in the most complimentary terms. As an advertisement of the work (including extracts from notices) is deferred for want of space, we will add that it is sold mainly by subscription,—that agents are still wanted in many localities,—and that copies are sent, postpaid, to persons where there are no agents on the receipt of the price, $3. Address this Office.

Beet Sugar in Wisconsin.—From the Prairie Farmer we learn that the Black Hawk Beet Sugar Manufacturing Co. report the production of 131,400 pounds of pulverized, granulated, and loaf sugar. Two hundred and thirty acres were planted in beets; product, 4½ tons per acre. The factory was run nearly two months at a daily cost of $400; the product per day was about $402, leaving a margin of only $2 per day. We are not told how soon the Company expect to get rich.

Would We Plant Onions This Year?—A correspondent says:—"We went largely into onions last year, and lost money by it, because everybody else grew a good crop. Shall we plant this year?" We should, but not so largely as to neglect to grow some other crop to fall back upon. Do not depend upon one single crop for income.

THE SEASON.

St. Charles, Ill., March 23.—Winter has been tedious, long, and with little snow. To-day is cold; and has been so all through March. Spring promises to be very late.—H. H.

Norfolk, Va., March 23.—Weather here is backward for this country. We have had double the cold weather, and as much again snow, as we have had for the last six years in any one winter. Cold and wet.—M. H.

Griffin, Ga., March 18.—Our season is late and cold. Planting operations at least one month behind last season. Fertilizers selling freely, and an earnest effort on the part of planters to put in a larger crop of corn and cotton.—J. H. R.

Union, Hardin Co., Iowa, March 17.—We have had some very cold weather for the last few days. Snow falling fast, with about four inches on the ground; good sleighing now. Wheat is worth 95c.@$1.05; oats, 20c.; corn, 18@20c.; potatoes, 35c.; farm labor, $18@20 per month; land, $10@45 per acre; timber scarce; coal plenty, at $4.50@5 per ton at the banks, 15 miles north.—E. F. W.

Cazenovia, N. Y., March 15.—Have had an unusually hard winter, with scarcely any rain to fill our cisterns. Never has there been such a time for twenty-five years to get money to pay current expenses of the day. Scores in our villages and hundreds in our cities are out of employment, with nothing to do but wait for the approaching spring. There is a better feeling exhibited in regard to dairying than there was a few weeks ago. Cheese has advanced until it is now quoted at 19 cts., while butter is quoted from 25c. to 30c. per lb. Cows are worth from $30 to $40 per head. Good sleighing at present, with fair prospect of two weeks more of winter.—C. S. N.

De Vall's Bluffs, Ark., March 12.—Cold weather here for this climate; have had white frosts four nights in succession, but peaches are not hurt, I think. Surface of the country generally level, with good drainage. About one-half prairie. Timber good; ranges in price from $1.50@5 per acre. Native cows, $20@30; oxen, $75@125; horses $80@200. Many Northern people here now, but do not know as they will stay long.—O. R. S.

Helena, Ark., March 21.—A terrible hail-storm passed over this place on the 18th, doing considerable damage to fruit-trees, etc. It was accompanied with a fearful tornado, twenty miles west of us, uprooting and twisting off the largest forest trees. A number of buildings were blown down, and several persons injured. Hailstones are reported measuring seven to nine inches in circumference. Weather pleasant, but cool.—J. H. O'C.

Glenville, Harford Co., Md., March 26th.—We have had a very dry, cold winter; have only had three or four days' sleighing. Wheat looks very poorly; many of the fields are entirely bare. There has been no plowing done here yet; frost remains in the ground, in many places to the depth of fifteen inches. Wheat brings $1.75@1.95 per bushel; oats, 55c. corn, 62@64c.; hay, $28@32 per ton; potatoes, 65c.; eggs, 20c. per dozen; butter, 35c. per pound; fresh cows, $40@$50; good work horses, $150@200; land, $50@100 per acre.—G. P. C.

RURAL BREVITIES.

We do not know of any agricultural paper published in Florida.

We are having inquiries for cranberry plants. Who has them for sale?

Charles E. Ash asks where he can purchase Sultan fowls. We cannot answer.

The Board of Agriculture of McHenry Co., Ill., propose to have a reaper trial this summer.

Dr. E. S. Hull has ceased to be horticultural editor of the Prairie Farmer, and W. C. Flagg is his successor.

Edward Durfee is informed that we know of no book that will assist him except Webster's Unabridged Dictionary, latest edition.

H. A. Coe, Theresa, N. Y., asks some one to tell him where he can get Carrington's Mole Drain Plow, price, etc.; also, their experience in using it.

The Agricultural College fund of Ohio, realized from the sale of land scrip, was originally $340,000. It has been increased by accumulated interest, to $459,647.08; and it is thought it will amount to $470,000 by the time the College is completed.

"A Subscriber" is informed that there are no lands in North Carolina owned by th United States, subject to settlement under the Homestead law; but there is plenty of good land there to be bought cheap. Go, see, and select for yourself.

PUBLISHER'S SPECIAL NOTICES.

The Rural New-Yorker is electrotyped, and hence Back Numbers can always be supplied. Copies for sale by all News Dealers; price Six Cents.

Additions to Clubs are always in order, whether in ones, twos, fives, tens, or more. A host of people are subscribing for papers about these days, and we hope our Agent-Friends will give everybody an opportunity to subscribe for the best.

The Rural New-Yorker is sold by News Dealers generally throughout the United States and Canada at Six Cents. The Trade is supplied by the American News Co., 119-121 Nassau St., New York.

Show Bills, Specimen Numbers, Etc., of the Rural New-Yorker sent free.

BUSINESS NOTICES.

"THERE IS NOTHING LIKE IT."

"Don't wish for better." "Better than any other we have used." Like it much." "Can't speak too highly of it." "There can be no fault found with it." "Can testify to its superiority." "Don't use any other." These are a few quotations from the hundreds of testimonials in favor of Dooley's Yeast Powder, which is the only chemically pure, harmless, healthy and nutritious article of the kind in market. Perfectly reliable, easy to use, convenient and recommended by all. For sale by grocers. Dooley & Brother, Proprietors, 69 New Street, New York.

DR. STRONG'S REMEDIAL INSTITUTE,

Saratoga Springs, N. Y., is unsurpassed in the treatment of Lung, Female and Chronic Diseases. Turkish, Russian, Electro-Thermal and Sulphur-Air Baths. Hydropathy, Vacuum Treatment, Movement Cure, Oxygen, Calisthenics, &c. Terms lowest in winter. Send for a Circular. Endorsed by Bishop Janes, Rev. T. L. Cuyler, D. D., and Tayler Lewis, LL. D.

Dr. Jayne's Expectorant is both a palliative and curative in all Lung Complaints, Bronchitis, &c. It is a standard remedy for Coughs and Colds, and needs only a trial to prove its worth.

LOVE AMONG THE SHAKERS.

THE day of confession came at last, and with it most unlooked-for and terrible disclosures. To the horrified amazement of the assembled eldresses, and amid our choking tears, Sister Minerva went down "into the valley of humiliation." With a bitter struggle for composure, her dark eyes dilating, her beautiful face white and set, she confessed that the "baneful poison of natural love" had crept, with insidious but giant strides, into her heart. What must have been her conviction of sin when, with the courage of despair, she admitted that Brother Ernest had absorbed all her thoughts for many months! She had borrowed his books, learned his language, talked to him, until, suddenly awakened and alarmed at the sympathy, congeniality and admiration which she felt with and for him, she would have fled from the pleadings of her own heart, if she had had strength left to do so. Then, deathly pale and panting heavily, she took from her bosom a packet of letters written to her by Brother Ernest. If they had been the price of innocent blood, Minerva could not have cast them down with more vehemence before the ministry.

With solemn emphasis the senior eldress spoke: "Let repentance have its perfect work. Read the letters aloud. Whom are they from?"

Minerva had spoken so hurriedly and incoherently that her lover's name was not yet known. With quivering lips she was forced to repeat it. A beseeching look at Eldress Orangia told her that the poor young sister prayed to be spared this ordeal of reading the letters; but not an iota of the cross could the eldress remove. She could only sadly whisper, "Nay, you must comply."

And the whole correspondence was read and the answers confessed, word by word, as well as the sinning sister could remember. One letter, written in German, she begged to have burned without reading. The eldresses, of course, were ignorant of the language, and looked undecided.

"I will burn it here, right before your eyes," entreated Minerva; and she took from a work-basket belonging to Eldress Philomel an old tinder-box and flint, a precious relic once belonging to Mother Ann. With feverish haste she struck fire, and the next moment Brother Ernest's words of love were converted into the white ashes of her sacrifice. Think what a sacrifice, when there were pages of rhapsody such as this:

"My heart goes out to thee, my soul cries out to thee in yearning, passionate might! Life has become a dream! How can I think it a reality? I was once surrounded, in my fatherland, with beautiful, high-born women, who had no power over my heart, and here I have yielded it wholly to thee, my enchantress—nay, my pure saint!

"Oh, how vainly I strive against my passion! Love at its wildest was never so untamed as the love of my undisciplined heart; and yet it is pure, for I would not touch the hem of thy garment, nor raise mine eyes to meet the heavenly-pure brightness of thine, unbidden by thee!" Pages and pages like this, written by a Shaker brother to a Shaker sister, in Wisdom's Valley! Truly, the "natural affections" were a hydra-headed monster in that afflicted vale about those times.—*Galaxy.*

THE FAMINE IN PERSIA.

REV. J. H. SHEDD thus writes to one of our religious papere about the awful famine now raging in Persia:

The famine is not only one of cereals, but of forage as well. The prophet of old exclaims, "Alas! for the day! how do the beasts groan! The herds of cattle are perplexed because they have no pasture; yea the flocks of sheep are made desolate." These pastoral tribes have been fighting for two years past with the drought, and as the pastures have dried up their stock has perished. The most melancholy result is the death of the animals in such a land as Persia. There are no rivers, no railways, no canals, no roads for wheeled vehicles, and so when the animals die there is no means for transportation except on the backs of men. In this fact is one of the aggravations of the present famine.

A proper system of roads, and two or three railways, with some systematic provision for such a crisis, would make a famine like the present one impossible. But when all communication is by caravan, over paths not highways, provinces two hundred miles apart are practically of no service to each other. Each province must depend on itself; and when the beasts of burden are perished, and in the case of the Eelyats the flocks and herds also, on which they depend for food, there is little left but for them to sit down in the Mohammedan resignation of fatalism, and live on short allowance till either relief or death comes. There are this winter tens of thousands of the Eelyats of Persia, with their horses, dead, their cattle and sheep largely so, with no accumulated wealth with which to procure bread, and no place where bread can be bought if they had the means.

The grass may arrive with the coming spring, but it will be three years at least before the flocks and herds can be renewed, and one year at least before there can be a harvest to supply the people with bread. Thus Sir HENRY RAWLINSON, who knows Persia well, speaks of it as a "doomed country." Certainly many of these pastoral tribes are "doomed" unless help shall reach them. Their own resources are exhausted, and their isolation is such, and the means of communication so destroyed, that, practically, they might as well be on a barren island in a sea whitened by no sail, as in their dried-up valleys.

TAHITI GIRL GATHERING ORANGES.

ELK, MOOSE, OR MOOSE DEER.

ON our last page, we give an original sketch of a gigantic animal, known as the Elk, Moose, or Moose Deer (*Alces Malchis*, or *Cervus alces*). This is the largest existing species of the deer family, and is a native of the northern parts of Europe, Asia, and America. It grows to be six feet high, and 1,200 pounds in weight. The neck is short and thick, to sustain the great weight of the head and horns. A single antler has been known to weigh sixty pounds. The eyes are small, the limbs are long and graceful, the tail is only four inches long, and the body is covered with coarse hair. The hoofs are made to part widely, so the animal can walk on soft ground or snow. In running, the moose throws its horns back, so as not to have them caught by branches of the trees. Its color is a brownish black. They are sometimes seen in herds, but more often singly. They are very rare now in Europe and this country. Once they extended as far south as the Ohio River. They love the woods and marshy places, and live off of the branches of trees, being unable to eat grass, unless they get upon their knees. They are very timid, but a single stroke from an elk's forefoot will kill a dog. This animal is extremely wary, and not easily approached by the hunter. The elk is easily domesticated, and its flesh is esteemed a good kind of venison. Many of our readers in Maine and Canada are, no doubt, familiar with the elk and its habits.

TAHITI GIRL GATHERING ORANGES.

THE fine representation of a "Tahiti Girl Gathering Oranges," given on this page, is from a water-color painting in the collection of the Duke of Edinburgh. The Duke, as many of our readers are aware, has, in his sailor capacity, been all over the world, and during his travels obtained a large collection of curiosities—the best and rarest of everything within his reach. On his second cruise he was accompanied by Mr. NICHOLAS CHEVALIER, an excellent artist, who made numerous drawings and paintings of curious incidents and scenes; and one of these paintings was the original of the above beautiful illustration.

JEAN INGELOW.

MRS. BULLARD, in the Golden Age, thus describes JEAN INGELOW:

MISS INGELOW herself is a buxom, fine-looking woman, somewhere near her forties. She has an abundance of soft, brown hair, which she winds in a graceful fashion of her own about her well shaped head; bright dark eyes, and a lovely changing color which comes and goes in her cheeks at the slightest provocation. She is shy, delicate and reserved, and has a true English aversion to being looked at and a still greater horror of being written about. Miss INGELOW is a thorough conservative in ideas as well as in tastes.

BY HOOK OR CROOK.—There appears to be no want of an origin for this proverb. In the great fire of London many boundary marks were destroyed. This in consequence of many disputes as to the sites of different properties, had a tendency to hinder the rebuilding of the city. In order to escape from the delay, it was decided to appoint two arbitrators, whose decision should be final in all cases. The surveyers appointed were a Mr. Hook and Mr. Crook, who gave so much satisfaction in their decisions that the building proceeded rapidly. From this circumstance comes the saying, "By hook or by crook."

UNDER the civil-service regulations, the female clerks in the Treasury Department, at Washington, are hereafter to receive such positions as their deserts merit, and take their chances of promotion with the men in the department.

THE WHISPER OF SPRING.

WHO hears the voice of death
In the tones of genial Spring;
In the sigh of the south wind's breath,
So merrily whispering?
Who does not welcome life
In each budding flower and leaf
With hope and beauty rife,
Reckless of care or grief?

O who can dream of death,
When merrily up there swells,
Grey turrets underneath,
The chime of Easter bells?
Christmas mirth may wane
At sight of a vacant place;
But the loved ones live again
In the Springtide's laughing face.

For Earth is never dead;
Though Winter's somber wing
Wave her to sleep in snowy bed,
She wakes again in Spring.
And happiness lives on,
And joy succeeds to grief,
As surely as winter snows are gone,
When bursts yon emerald leaf.

So up, and join the song
Ye sang mid Yule-tide dearth,
Raise it loud and long
In midst of Springtime's mirth.
April passes away:
His showers are like our tears,
Giving place to golden May,
As in all the by-past years.

[*Tinsley's Magazine.*

Our Story-Teller.

NETTIE STERLING;

OR,

WHAT ONE WOMAN DID.

BY DE FORREST P. GUMMERSON.

CHAPTER I.

"IT'S no use, NETTIE! I may as well give it up first as last. My strength is not equal to the work I have to do. I don't want to complain, or make you feel sad, my dear; but when I look back and see what a great strong fellow I was when I asked you to be my wife, and then at the wreck I am now, and how all the golden plans that we then made have come to naught, it does make the bitter crowd out the sweet of life and leave me completely stranded. If it were not for you, my darling, and BIRDIE, I think I should be certain to yield some morning to the temptation of seeking rest in the smooth-flowing river which I cross each day on my way to and from business."

The speaker was EDWARD STERLING. NETTIE was his wife. As he said, his strength was not equal to his work. Early in the previous winter he had been dangerously ill with hemorrhage of the lungs. He had partly recovered from this illness, but the return to even partial health had been of necessity slow. He should not think of returning to his business, the doctor had said—at least for some months to come. He must return at once; the needs of his loved ones demanded it, and this ruled him. But the days dragged so wearily on, and his strength was so inadequate to the self-imposed task, that at last, when he really felt he could stand it no longer, he had let fall the words with which our story opened.

It was no use. It needed no words from his lips to convince the most casual observer of the man of this fact. Every nerve in his over-taxed body had been strained to its utmost—for this man had an iron will—but even iron wills are sometimes broken, and then what is there left but to yield, bitter though it be? He had one dream that seemed to him brighter than all the rest. It was of a home in some quiet country town, where, far away from the noise and bustle of city life, he might regain his health and win back some of the old and happy feelings of the past.

It was a fair picture that his imagination painted. NETTIE, sitting at the close of a June day upon the porch watching him at his work among the flowers, and in the garden,—and laughing, bright-eyed BIRDIE, chasing through clover-tops, fragrant with perfume, some doomed butterfly. Then, when the evening came, a quiet little home circle in which all hearts would be happy and no care would come creeping, or dread of the morrow's busy throng in the city.

It was a bright picture. You who have had perchance the same experience, know how, after some severe illness, a terrible dread came over you of the life of contention, and whirl, and excitement, that you had lived in before. And then, as the vision of green fields, and running brooks, and the soft melody of the singing of birds, like the Syren's song of old that lured the mariner on to destruction—so these songs and the vision seem to lure you on to a life of future happiness, and rest in fields elysian.

NETTIE STERLING was a brave woman—not such an one as martyrs are made of—but a woman who would look great difficulties squarely in the face, and then march on to overcome them. Her nature was a large one; she could listen to the sufferings of others, and when she had become fully aware of their extent, she could pour the balm of sympathy into their wounds, and something more substantial into their homes, if needed. This, in her better days, when plenty smiled upon her. But now, when a dark cloud lowered over her, she found the world too largely selfish. Of those whom she had helped in their hours of trouble, but two or three remembered her in hers. This night, on which her husband said, "It's no use, NETTIE," he had also told of his vision of the life that might be theirs in the country. And she listened and drank all of its golden beauty in, as he pictured it to her, until, ere he had finished, it had become her one hope and wish that it might be.

"We will go," she said.

"Ah! if we could;" regretfully.

"Well, why can't we?" in surprise.

"Oh! there are so many things in the way that I dare not enumerate them lest I frighten you. First——"

"Never mind the first, my dear. If we don't count them at all there will be so many less to overcome. As I said, we will go! decidedly."

EDWARD STERLING looked into his wife's face with no little surprise. To tell the truth, he had never seen her evince so much determination before in all the years of their married life. What had come over her?

"I have long thought about this," she said. "I am so tired and pained with seeing you so overworked, and wearing that worn-out look, which has been yours of late. Here, it seems to me, I can get nothing to do by which I may assist you, and make life easier. But in the country, I could keep cows and chickens, and cultivate flowers. If we did not go too far away from the city, I think I could do quite a flourishing business by the sale of flowers, to say nothing of the rolls of golden butter I should make, and the eggs we could dispose of."

EDWARD STERLING was more amazed now than before. He had never believed in woman other than as a creature to be loved and tenderly cared for. That a woman should have schemes and business plans, seemed so preposterous that, when his little wife made this unorthodox declaration, it almost took away his breath. He stood and watched her intently for a few moments, and then as the—to him—seeming ridiculousness of her plan shone in upon him, he broke into a laugh—not a joyous one, however, for he could not laugh without pain.

Nor did he laugh long, for a crimson stream, that soon filled his mouth, stopped all laughter, and brought tears into NETTIE'S eyes. He had brought on another hemorrhage! NETTIE flew about and got him some salt and water, which he drank quickly; then she prepared the bed for him, and placed him thereon. The astringent properties of the salt and water soon stopped the flow of blood; but NETTIE knew that weeks, perhaps months, must elapse before her husband could again leave the house.

"Oh," she said, "if this had not happened! I wonder if there is ever any great joy that is not, sooner or later, strangled by some greater sorrow. Only a few moments ago I was so happy at the thought of a home in the country, and rest for my dear husband; and now, all my joy is gone."

As soon as she could, she sent one of the neighbors for a physician. When he came, he gave her medicines to strengthen her husband. He was sleeping now. The physician was a man of large sympathies, and he knew how much this woman loved her husband, and how great her anxiety about him must be. So he bade her be of good cheer; her husband was in no immediate danger, and, perhaps, when spring came, and he could get into the country and breathe the fresh air, and drop the irksome duties of business life for a time, he would get well again.

Into the country! NETTIE dried her tears at once. Then, when she could collect herself, she told him her plan; how that poor, dear ED. had laughed at it, and how that had caused his bleeding.

"But, oh, doctor, I do believe it can be done. I know that I can work, and what would I not do that he might be spared to me?" And the doctor, looking full into those earnest eyes, believed, too, that it could be done; nay, more, that it should be.

EDWARD STERLING progressed but slowly. The days wore on, and were gone, and he was still as weak as a little child. When one is confined to bed with illness of a dangerous nature, it is necessary for a rapid recovery that the patient should be free from care and worriment of mind. With a family upon his hands, how was it possible for EDWARD STERLING to be thus? Could he steel his heart and shut out all their needs, and become callous to their sorrows? Knowing the man, I answer, "No!"

When he had made NETTIE DISBROW his wife, he had resolved to shield her and care for her always with tenderest love. Now, when this sorrow had come upon her, and with the prospect of ultimate want before him, his recovery seemed too slow to cause even the faintest hope to spring up in his bosom. He suffered more on their account than his own. What if he should never get well? What would become of them then?—a question he asked himself twenty times a day, and as often failed to find an answer.

If we could only leave these difficult problems with GOD, and not try to solve them. He is wiser than we; and yet who among us that would not sooner take our destiny into our own hands, than leave it with Him? Is it because we are too blind to see that He has only our good at heart!

Lying day after day upon his bed, with this vision of country life ever before him, EDWARD STERLING became as anxious to go as had been his wife. It seemed the one wish of his life now—the last uttered at the going down of the sun, and the first expressed when its warm rays came stealing into the windows at early morn.

It was but yet mid-winter, and the days seemed so far away ere spring would come. To remain in the city until then he believed would be almost certain death. NETTIE, knowing his fears, and seeing how anxious he was to get away, daily watched the papers, in the hope that some chance advertisement might meet her eye, of a snug little house and plat of land for sale, such as would come within reach of their slender means. She had a perfect horror of rent-paying always; and, to tell the truth, I think she was right. It seems so like paying out one's money without sufficient return to warrant the expenditure.

When her father had died he had left her the small sum of five hundred dollars, and when it came into NETTIE'S possession she had said, in a decided manner, that "not one cent of the money should go for household expenses, unless in case of sickness." So she had invested it in Government bonds, and held them as firmly as though her future salvation depended upon them, which to some extent it did, if one may believe in the theory of each one working out his own. At last, when it really had begun to look as though there were no places for sale in the country, her eye fell one morning upon an advertisement that filled her heart with a sudden and great joy. A cottage-built house, with seven rooms, together with four acres of land, all modern improvements as far as could be had in a country house, a good spring of water on the place and within a few feet of the door, must be disposed of at once, as the owner was about to leave for Europe per next steamer; a rare chance—price two thousand dollars.

When she had finished reading this, she flew about in a perfect bewilderment of joy. BIRDIE was dressed as quickly as possible, and dispatched with a message to Dr. WILDRICK, asking him to come as quickly as possible. He came, and with a frightened look asked, "If anything had happened to Mr. STERLING." NETTIE, in her haste, had not explained matters at all, so he feared that his patient was worse.

NETTIE answered him at once. "Not that, thank Heaven! not that. But I have found the enchanted and long sought for palace—our country home, you know—and she handed him the paper, pointing with her finger the while to the advertisement.

Dr. WILDRICK scanned it over hastily, and then replied:—"We must look into this matter; these pen-pictures of country houses are often very nice, but upon actual examination turn out to be somewhat highly colored. I will attend to this at once, however. Oh, by the way, how much did you say you could pay down, Mrs. STERLING? It has slipped my memory."

"Five hundred dollars, doctor; the coupons will leave me enough to pay all the expenses of moving."

"I will go at once;" then turning to the door which opened out of the sitting-room into that of the invalid's, he entered and attended to his wants. After having seen that he was made comfortable, he went to his own home. Two hours later the outgoing train bore him towards Woodvale, the *locale* of the advertised country home, "with modern improvements."

CHAPTER II.

WHEN Dr. WILDRICK entered the charming village of Woodvale he felt at once that this was the very place for the STERLINGS to come. He knew that to one with the refined tastes of Mrs. STERLING the kind of people she would meet would have largely to do with making her happy or otherwise. The people here seemed to belong to that well-to-do class who had not neglected every chance of intellectual improvement for the vulgar occupation of living only for the money they might accumulate. There was an atmosphere of thrift everywhere about the place, which, though it was severe winter, gave unmistakable evidence that when May suns and gentle winds should come again, it would burst forth into a blossoming fairy-land of flowers and beauty.

He found that the house in question was in reality a desirable one. To be sure the "modern improvements" were not many, and yet sufficient to acquit the owner of any attempt to deceive. It was situated at the extreme end of the village, yet quite near to the depot—so that, if Mrs. STERLING'S dream of selling flowers came true, she would not have far to go in order to send them into the city.

Mrs. STERLING had given the doctor full permission to do as he thought best in regard to the purchase, fully trusting him—a trust which he did no betray—for when he returned that evening he placed papers in her hand which made her owner of, as he said, one of the loveliest homes in the world; but then he was somewhat of an enthusiast, and prone to indulge sometimes in hyperbole. Mrs. STERLING did not know what to make of it at all. Surely the five hundred dollars she gave him would not pay for it. But he soon explained that it's owner was compelled to make a cash sale so he advanced the rest, thereby getting it for fifteen hundred instead of the two thousand which had first been asked, and Mrs. STERLING could repay him a little at a time, as she found it convenient, without regard to interest.

Noble man! If in this land thy like was oftener found, how many hearts that now break daily, might beat in the fullness of a new life—free!—the shackles that now bind them unloosed. And yet the love of gold makes men so cruel the lesson taught by thee can never be learned by some whose wealth is treble thine!

Mrs. STERLING at once commenced making preparations to move. She told her husband what she, with the aid of the doctor, had accomplished; and I think that the sweet, satisfied look of love and admiration that came stealing into his pale, wan face, was sufficient reward for her. There was much to do, and it did seem as if she was not strong enough to go through with it. I think the doctor feared she would break down under the mountain of things, too, for one morning he came marching into the house, with a great, stout Irish girl closely following at his heels.

"I've brought you some help, Mrs. STERLING," he said. "If you go on in this way, I shall have two instead of one sick on my hands. It's really labor-saving to myself, as well as to you, you see, so don't make an objection."

Then he turned and started quickly towards the door; but NETTIE was as quick as he, and ere he could close it, stared him fully in the face, and said—"Doctor, I cannot afford to pay for help, and I *can* get along without it."

"Don't want you to pay for help. I attended the girl's mother through a long sickness, and it's the only way I shall ever get my pay—in this world," he carefully added—"and besides you can't get along without it."

Then he was gone. And NETTIE went back, seeing how useless it was to refuse to accept this new kindness of the doctor.

BRIDGET DELANY proved a good and efficient help. She took hold with a will, and accomplished more in feats of strength than ever NETTIE could have done. Then, too, she had a kind heart; and having known what it was to have a sick one to care for, could the more easily sympathise with her mistress, and do many little things which one who had not lived through the experiences of a sick room would never have thought of. BIRDIE became an especial favorite with her. Indeed, I doubt if any one could have lived 'neath the same roof with this laughter-loving, mirth-provoking child, and not have loved her. To be sure she made BRIDGET more work than a quieter child might have done; but when Mrs. STERLING would forbid her the kitchen, and say she was bothering BRIDGET, the good-natured girl would reply for her:—"Now, mam, can't yez lave her alone wid me. It's just all the fun I hev whin her own illegant silf is botherin' me, as yez call it."

And the days wore on. It was now nearly March, and NETTIE had determined to be in her new home as early as that month at the furthest. There were lots of bulbs she must start then, the seeds for early tomatoes must be planted. Once or twice she had accompanied the doctor down to Woodvale, where he had helped her to make sundry improvements about the place—the doctor's cheerful little wife coming in to stay meanwhile with Mr. STERLING.

The first week in March two great wagons stood in front of the STERLING'S city home; and then strong men came into the house and bore away the furniture. Mr. STERLING was driven to the depot by Dr. WILDRICK, and safely placed, amid shawls and pillows, aboard the train, with NETTIE and BIRDIE to see that he might want for nothing on the way.

BRIDGET, who had grown to be of too much use to the family to be spared just then, remained behind to look after the things and see that everything was safely packed away—a duty which she faithfully performed to the end.

That night there shone no light from the home which had been the STERLINGS so long; but in another, nestled amid trees that would some day be verdant with leaves, through the window might be seen the form of a woman whose face was radiant with joy, busied in preparing the evening meal; while seated in an easy chair, listening to the prattle of a child, was a man, wan and pale-faced, whose eyes followed the movements of the woman, with loving and tender looks.

BRIDGET remained with the STERLINGS until the house was fully in order, and then NETTIE was forced to part with her, as she could not conscientiously let the doctor pay her, and she really could not afford so great a luxury. BRIDGET was very loth to go, and declared that she would remain for her board, if Mrs. STERLING would only keep her. But NETTIE knew that this would be unjust to the girl; and so, great as the temptation was, she was strong enough to meet it, and answer no.

BIRDIE almost cried herself sick when she heard that BRIDGET was going away, and the poor girl, feeling as badly about it herself, took the child on her lap and tried to soothe her grief by telling her that "jist as like as not, whin the mother was rich once more, she'd come back agin till her, so she would!"

And BIRDIE, child like—for her hope in the future had not yet become deadened by the bitter disappointments that most of us meet with—believed that this might be, and dried her tears and looked only at the time, in the far-off, when her BRIDGET would come back again.

"If yez are in wunt of a girrul, ma'am, BRIDGET DELANY'S the one thut'll come till yez, if yez had niver a cint in the wurruld to pay her wid, at all at all," said the DELANY, as she went out of the door, with her bundle in her hand. Would she ever come back again?

Mr. STERLING made no rapid strides toward recovery. It would take time, perhaps long and weary months, before he could be of even the slightest assistance to his wife. NETTIE knew this, but never, by look or word, did she let him know that she missed his wonted help. I think GOD, knowing how great a burden this woman had to bear, gave her strength and a cheerful disposition, in order that it might not crush her.

April came at last. Now, in connection with her household duties, came the care of her garden. One whole day was spent in finding a man to plow it for her. At last this was accomplished; and when the man received his pay, he asked, "Who was goin' to take care on't—hoe it, and keep out the weeds?"

NETTIE'S answer caused him to break out into a broad laugh, and to say, "That wouldn't do!—women didn't work out o' doors in this 'ere region; it wasn't considered the thing."

"Well, the thing or not, that is what I came here for, and what I intend to do," was her reply.

I think if there had been some other way open for her, she might have withdrawn, even then; but the thought of her husband and child made her strong in a moment, and her resolve to conquer this obstacle greater than ever.

She busied herself throughout the earlier part of each day in the garden, made beds for lettuce, and other early vegetables, and the rest devoted to her household duties. When the time for planting her flower seeds came, she spent the whole day out of doors, and at night, after her duties were through, would often be too tired to sleep.

One day, BIRDIE came running in; her hands filled with tiny blue violets, fragrant with the morning dew. "I found them in the meadow," was her answer to her mother's eager question of "where did you get them?"

NETTIE went to the meadow forthwith. She was one of those women who take time by the forelock—and when she returned to the house, her apron was filled with the blue treasures, while BIRDIE was sent back with a basket for more. She neatly arranged them in tiny bunches, and when the evening train left Woodvale that night it bore over one hundred of these floral treasures into the city.

Before NETTIE left the city, she made arrangements with a florist there to send her flowers to him. He made the sale of small bouquets a specialty. It was, as yet, early for violets, and they sold rapidly; so he sent a letter to NETTIE, telling her of this, and advising her to send all she could get; and when they had ceased to bloom, NETTIE had received from him, as her share of the profits, over eighty dollars.

Dr. WILDRICK came down soon after NETTIE'S successful "violet speculation." He brought with him a copy of the RURAL NEW-YORKER, containing a lengthy article on the cultivation of flowers.

"You will find this very useful," he said. "It tells one how to accomplish almost everything, from flower culture to butter making, and as an aid to keeping a "hen dairy," it is just indispensable; and I have ordered it for you for the next year."

"Oh! isn't it nice," said BIRDIE, who had an eye for pictures, and just at that moment had caught sight of a pair of pigeons that graced its first page.

NETTIE thanked the good doctor for his kindness, and hoped she should yet be able to pay him.

"Of course you will," he said. "Don't my wife and I intend running down here every little while during the summer, and get our pay by listening to the music of your birds, and stealing some of your most beautiful flowers." A thing which they did; but as they always brought much more than they took away, their visits did not leave the STERLINGS any the poorer.—[Concluded next week.

Ladies' Port-Folio.

SINCE YOU AND I WERE YOUNG, JOHN!

BY MAJASA.

THE times have strangely changed, JOHN,
Since you and I were young,
And Parson WELLMORE spoke the words
That made our lives as one.
Our two wee rooms were sparsely filled;
I smile as I recall
Your wedding coat, of homespun blue,
That hung upon the wall,—
But *then* it was the fashion.

The years passed on—you plowed and hoed,
I churned and baked and spun,
While JOHNNY played about the yard,
With RUTH, the little one.
Oh, those were happy days, JOHN,
But yet for fancied gain,
We left the dear old homestead
For that small village lane—
For 'twas, you know, the fashion.

The village grew and put on airs;
I would not be behind,
And often did things that I'll own
Were not just to my mind.
But Squire BURNAP lived right across,
And rich folks down the street,
The children must do like the rest,
As they would daily meet—
And so I followed fashion.

Both JOHN and WILL soon left our home,
They're money-making men,
Oh, could I have but for one hour
My merry boys again.
SARAH and RUTH—perhaps 'tis best,
They live in style I know,
And yet I wish that life for them
Was not all dress and show,
And running after fashion.

EVA was married long ago,
Our youngest and my pride,—
I heeded not your wishes, JOHN,
But put them all aside,—
And toiled, ah yes, beyond my strength,
That she my pet might shine,
A brilliant star among her set;—
Alas, this child of mine,
Leaves *me* now for the fashion.

And Sunday mornings, JOHN, you know,
When they were fair and young,
Our children filled the corner pew,
Folks said "how well they sung."
We never dreamed we'd sit alone,
Because far up the street,
The rich and stylish led the way,
And took each highest seat;—
Must *Faith* yield to the fashion?

Our home is grand, but lonely now;
JOHN, do the children think
That old folks can have other wants
Than clothes and food and drink?
How pleasant if they'd sometimes ask
Their parents out to ten,
With half the smiles they gave to-day
To that weak General B.—
But Generals are the fashion.

The times have strangely changed, JOHN,
Since you and I were young,
And Parson WELLMORE spoke the words
That made our lives as one.
We're old and feeble, JOHN, you know,
And to the times must bow,
But one thing I can plainly see—
We should be cured for now,
Could it but be the fashion.

Virden, Ill., 1872.

CHILDREN IN THE CITY.

BY CECIL BRADDON.

THE CHILDREN!—what could we do without them? They are at once our trouble and our joy. They brighten up our homes with their innocent prattle and their merry laughter; they cut paper dolls out of our parlor curtains, break our vases, and their little mischievous hands find their way to the most secret recesses of our drawers. Then we find in dismay our boxes have been opened, their contents scattered, and our Cologne bottle almost empty. But how can we be angry with the little ones, when they look up to us with such wondering innocent eyes, and cling with baby tenderness around our neck? Not only do they turn everything upside down, but they are keeping us in perpetual fear lest they should put their precious little lives in danger by upsetting the tea kettle over their heads, falling down stairs, or what is worse, into the well.

Yet, who of us is not happier for all this trouble? What mother would not willingly endure anything, rather than have the patter of those little feet cease, and the merry voices be hushed in her home. But if they do cease—if the Death Angel takes her darlings away in her arms—how tenderly and sadly each article, from the broken toy to the half-worn baby shoe, is cherished by the mother! If the little ones are taken away and the music and gladness go out from their home, so do the cheerfulness and joy go out from the mother's heart; everything is then so changed, so dark and desolate to her!

When I see a childless man and woman, with a heart as large as the great gloomy house they inhabit, I always wonder why they do not go out into the street and pick up the first little vagabonds they meet;—then, with soapsuds and love they could make them beautiful, merry children, to make musical their silent halls, and warm their hearts with their childish love. They then would save some little souls from a career of crime, which is begun by learning little sins in the streets. Oh! if every homeless little wanderer could be saved in this way! If fathers and mothers, who have happy homes filled with loving children, only thought how many little outcasts, with faces as fair and hearts as innocent as their own dear ones, were forced, by no fault of their own, to enter, as soon as they came into the world, in the lowest school of vice and infamy—who never knew the blessed influence of a happy home, the sweetness of a mother's smile, and never were taught at her knee night after night to say "Our Father"—if they did but think of this, they would wish to bring them to the safe, warm shelter of their own homes.

A few days ago, when passing down one of the crowded thoroughfares in our great city of New York, I met one of these outcasts. It was a little girl not more than six years old. Her face would have been pretty if it was not pale, pinched and dirty,—and her matted hair could be combed into beautiful ringlets, if kind, loving hands would do the work. Her dress—if such tatters could be called by that name—was no covering at all against the bitter cold. As she stood there she was rudely jostled by the careless crowd, who took no notice of that little outstretched hand, and scarcely heard that pleading voice that asked for "only a penny." I paused, as I was going by, and asked her why she staid out in the piercing cold instead of going home. She looked up wonderingly, as if the word home was a new one to her. Then I asked her why she did not go to her mother.

"Oh!" she said, sadly, "I have no mother;" and added, with a shudder, "I dare not go to my father; he gets drunk, and he would send me out again, to stay all night, if I did not bring him some money."

I dropped a few coins in her hand, and reluctantly went by. A little further on I saw a group of boys at a street corner; they were scarcely older than the girl I had just left, and yet their young faces had a sharp, cunning, and I might say, wicked look, as they stood there talking and swearing in a manner fearful to hear from such young lips.

Oh! it is frightful; and yet every great city is full of such little outcasts. If we could only snatch them from the dark career of vice and infamy they are just beginning, and make them, like our own curly-headed, laughing, little darlings at home, we would have something worthy of acceptance to render up to the child-loving CHRIST.

AUSTRIAN WOMEN.

WOMEN in Austria perform the duties of bricklayers, laborers, and may be seen carrying hods of mortar and baskets of brick up high ladders. More than this, they actually supply the place of navvies, and dig and wheel barrows of "ballast" almost as nimbly as their lords. They chop wood, they carry water, they offer to black your boots in the street, and perform many other little offices, which, according to our notions, hardly come under the denomination of "women's work." Perhaps this state of things is considered necessary to keep a standing army of 800,000 men. The women work inordinately hard, while hundreds of idle men are constantly sauntering about in various uniforms, doing nothing at all, except, perhaps, blowing a cloud of tobacco smoke.

WOMAN'S POWER.—Those disasters which break down the spirit of a man, and prostrate him in the dust, seem to call forth all the energies of the softer sex, and give such intrepidity and elevation to their character, that at times it approaches to sublimity. Nothing can be more touching than to behold a soft and tender female, who had been all weakness and dependence, and alive to every trivial roughness, while threading the prosperous paths of life, suddenly rising in mental force to be the comforter and supporter of her husband under misfortune, and abiding, with unshrinking firmness, the bitterest blasts of adversity.

BULWER says poverty is only an idea, in nine cases out of ten, and that there is really more happiness among the working-men in the world than among those who are called rich.

A YOUNG gentleman who had just married a little beauty, says:—"She would have been taller, but she is made of such precious materials that Nature couldn't afford it."

Reading for the Young.

SNOW DROPS.

RUDDY and gleeful children,
Seeing the snow-drops blow,
Shout to each glad new-comer,
"Lo! here are the eyes of summer,
Peeping from under the snow."

But the tender mother lingers
To kiss them where they grow;
For they 'mind her of baby fingers,
Of waxen, baby fingers
'Neath their coverlet of snow.

SAM IN ADVERSITY.

THE sun had disappeared behind the hills, and withdrawn the last of his fairy train who, robed in amber and violet and rose, had mingled in a maze of beauty upon a floor of light. The big moon arose from the opposite hills, with a wondering stare, as if not fairly awake—then roused herself and mounted away from the encumbering trees, and moved serenely above the river. The funny, glad waters! How they blinked and winked and glimmered and glistened and gleamed and glanced in mad merriment—mimicking the stately moon, and even the little stars!

Such a night to be out! And some bodies thought so, I am sure, for they clambered down into the boat, and the ladies tucked their skirts about them, and gave their shawls an extra twist, while the young men fell to the oars and shot the boat out into the river.

SAM WELLER came down to the boat a minute too late. "All this fun and I not in it," he moaned to himself. SAM was only a dog, so, when he whined piteously, they only glanced at him and sped farther up stream. "I shall burst!" he thought, "so full of words and no way to express them! It's a shame! If I could only *shout* as FRITZ does." So he whined, and rolled over and over in a twinkling, and bounded back and forth, and finally perched on a pile of lumber, looking like

"Patience on a monument
Smiling at grief."

He was not long thus resigned, but set up a piteous howl. This failing to soften the heartless boaters, he rushed down to the floating logs—bobbing from one to another, an excited, injured creature. The boat did not pause, nor did SAM, until he came suddenly to a big pier and could go no further, for the water washed all about it. SAM knew how to swim, but he had some human weaknesses. He looked at his pretty coat, which the fine lady at the house had declared was equal to real Astrachan; and he thought how clean and dry his pretty feet were; and he felt timid, too, for though the water was so full of its gay pranks, he knew it was deep, and dark, and treacherous—full of uncanny inhabitants, dreadful society for him! More than all, he *should have to swim or die!*

He, therefore, looked dolefully up and down and across the river, dropped his tail, and wailed a long wail. Suddenly he stopped his wail, wagged his tail with energy, and said, all to himself, "I'll go or die!" He scrambled down the pier, plunged into the dreadful wicked water—put out his paws and beat it with all his might. His drenched head looked like a bullet bobbing on the water. So funny!—SAM didn't think it funny. He was in dead earnest, panting, puffing, struggling with the waves.

The boat moved serenely onward. "Oh, they won't wait! I shall be drowned!" And SAM's heart sank. "Oh, ho! here is a log; I can climb up and rest." The log was not at rest itself, so it rolled and rolled. "So much time and strength wasted trying to rest," thought SAM, with vexation. The log was in his way; he would'nt bob under—must keep his head above water—so he swam on to the end. Here the latent strength of his nature came forth. "I *won't die!*" And he struck bravely onward.

"Do see the noble dog," exclaimed the kind girl in the boat. "Do stop for him, I beg!" How those get helped, who help themselves, do they not?

So SAM came alongside the boat and FRITZ caught him by the neck and pulled him in.

"You brave, cunning rascal!" he said, and held him fast, so he could not shake himself. Pretty soon FRITZ forgot to hold, and SAM thought now was his time to be comfortable, so he gave his soaked body a terrific shake and showered the whole party. The lady with the starched dress scolded—the others laughed. FRITZ looked into the kind girl's face, which the moon illumined, and said, "It's too bad," and she gently laughed "No matter," and wiped her sprinkled face. FRITZ looked down on SAM and said he was "bad," but patted his head so softly that SAM laid it on his knee, and felt secure.

They all began to sing,

"I'm dreaming of Hally."

The music floated over the water, even to the shadowy shore. SAM thought it very sweet. He wondered, as he glanced from face to face, if FRITZ and the young lady before him were dreaming of *Hally*. Again he felt as if he should burst, he wanted so to sing of the time when

"The 'possum sat in a 'simmons tree,
Looking cunning down on me."

They touched at the shore a minute. SAM forgot his past troubles, and bounded out, and roamed about the island seeking his pleasure—just as people sometimes do—and when he returned, lo! the boat was gone! He looked at the water and shuddered, and then the strength within him came up again, and he thought, "served me right to leave—so here goes!" He plunged in and plowed lustily through the waters.

The kind young lady exclaimed, "There comes our fearless SAM. Do stop for him, I beg!"

"Oh!" screamed the starched lady, "don't! He is nasty and wet."

"Never mind; I will hold him," said FRITZ. So he rowed up to poor, tired SAM, who scrambled up, but missed and fell back, giving the boat a great lurch. The starched lady shrieked and jumped, SAM sprang up again, and, somehow, together, over they turned the boat.

Not one of the party can tell *just* how it happened—not even SAM. They can only tell that they were all struggling together in the water, thinking a life-time of thoughts in a minute, and that FRITZ caught the kind girl by the dress, and swam to shore, and the other young man came near being drowned with helping the frightened girl near him. He caught her by the hair and it came off, then she grasped his arm, and by a master effort he reached shore; and the first thing they saw, on wiping the water from their eyes, was SAM towing in the lady who was starched; but, now, alas! was limp enough. So while they all were restoring her SAM shook his dripping coat and sat down and wagged his tail complacently; and viewing the scene, quietly said to himself: "It is a good thing for dogs to practice swimming, if they do live on land, and can afford to live without it. Then perhaps they can do good to even those who despitefully use them.

PROBLEM.—No. 5.

A CORRESPONDENT sends us the following problem, and asks for answers. We will publish such as we receive in two weeks, with the names of those who send them. A subscriber says:

"I have an angular field, situated on a level plain, whose 3 sides are, respectively, 20, 30 and 40 rods. Let it be required to tie three horses at the three corners of the field with the rope attached to each horse's nose, sufficient in length to allow him to eat one-half the contents of said field, provided the other two were not present. Required, the length of the three ropes and the amount of land the horses would have in common."

BIBLICAL SQUARE-WORD.—No. 3.

A FAVORITE flower.
A prophet who induced the King of Judah to renounce idolatry.
A celebrated Arabian city.
A tower called the tower of the flock.

From France.

ENGLAND and Spain regret the course of France in relation to the Commercial Treaty, and Spain will make reprisals, if duties are collected before 1877....Paris is still in a State of siege....The taxes of the last few months have produced 500,000,000 francs....France has a minister with the Pope, but none near Victor Emanuel....A literary convention with the U. S. has not been concluded....The proposition to tax raw materials has been abandoned....Germany will evacuate France upon the immediate payment of 500,000,000 of francs....France has abrogated her commercial treaty with Belgium....Gen. Trochu has commenced a suit against *Figaro* for libel....The Assembly is to take a two weeks' recess.

The Northern Pacific Railroad.—In whatever way the Northern Pacific Railroad is regarded, whether as to executive management, route, resources or business, it is a great enterprise of universal interest. The northern portion of the American Continent is rapidly becoming the bond of union between the trade of Asia and of Europe. Its railways, and especially the Northern Pacific Railway, will naturally command a great through traffic; and the local business will increase year by year with the development of the country. The line passes through one of the best wheat-growing regions in the world, and through districts teeming with many kinds of mineral wealth. These are the elements that attract population, and population implies industry, by which wealth is accumulated and distributed.—*London Money Market Review.*

Reanimating the Hair.—When the hair ceases to draw from the scalp the natural lubricant which is its sustenance, its vitality is, as it were, suspended, and if not promptly attended to, baldness will be the certain result. The one sure method of avoiding such an unpleasant catastrophe is to use Lyon's Kathairon, which, when well rubbed into the scalp, will speedily reanimate the hair and prevent it from falling out.

Facts for the Ladies.—Mrs. Sarah J. Fredericks, Toledo, Ohio, has used Sewing Machines for seventeen years, the last ten years Wheeler & Wilson's Lock-Stitch, and finds it far better than the other kinds. It runs lighter, with less fatigue, and holds a truer tension. She has used it for all kinds of dressmaking and fancy work. See the new Improvements and Woods' Lock-Stitch Ripper.

Watch No. 21039, Stem Winder—manufactured by United States Watch Co., (Giles, Wales & Co.,) Marion, N. J., has been carried by me four months; its total variation from mean time being seven seconds per month.—S. M. BEARD, firm of Beards & Cummings, 128 Front St., New York.

Political.—Various opinions regarding Grant's nomination, but one as to our $75 Four-Ton Hay Scale. THE JONES SCALE WORKS, Binghamton, N. Y.

For simplicity, beauty, durability, cheapness and effectiveness, we sincerely commend that Queen of dairy implements, the Blanchard Churn.

THE MARKETS.

MONEY AND TRADE AFFAIRS.

NEW YORK, Saturday, March 30, 1872.

SINCE our last Wall Street report the excitement in Erie Stock has been intensified by increased orders from Europe to buy, and by purchases to close out short contracts at home. The New York speculators are understood to have sold the stock heavily for future delivery at from 35 to 40 per cent., and ventures of the same sort were taken by speculators in the neighboring cities. When the price mounted on Monday and Tuesday last up to 55@60 per cent., many of these parties took alarm, and hastened to close out at a severe loss. The sales run up subsequently to 67¾ per cent. on Tuesday, returning to 58¾ per cent. on Wednesday night and Thursday.

Aside from Erie Stock there is a strong improvement in the market, backed up by the changed feeling in England and on the Continent in regard to the integrity and protection of American Railroad property since the overthrow of the Erie Ring.

In general Trade the business of the week is active. The imports are large, and the sales of Foreign Dry Goods from store and through the Auction Rooms are active and at satisfactory prices. The Exports of Produce partially improved, both from New York and the Southern Cotton ports. Our import trade throughout the country continues to gain on last year, and while the Export movement of Domestic Produce also shows a gain, it is not in correspondence with the excess of Foreign Merchandise consumed and which has to be accounted for by Gold or the further employment of American Stocks. The Bureau of Statistics in the Treasury Department has just completed the returns for the sixth month of the current fiscal year, and we here present a summary of the Foreign Trade movement of the half year ending December 31, 1871.

FOREIGN TRADE, UNITED STATES—SIX MONTHS.

Imported goods in gross		$278,458,131
Re-exported to other markets		8,997,403
Total, as for U. S. markets		$271,460,728
In bond, June 30, 1871	$68,324,630	
In bond Dec. 31, 1871	68,911,253—	616,594
Total taken for consumption		$270,841,134
Exports American produce, gold value		18,629,129
Trade balance, July 1 to Dec. 31		$72,215,005
Exported in domestic specie	$26,413,082	
Exported in foreign specie	4,636,539	
Together	$31,137,861	
Less foreign, imported	5,921,136	
Net outgo of specie		$25,216,725
Apparent balance against United States		$46,998,280

COMPARISON WITH CORRESPONDING MONTHS.

	July 1 to Dec. 31, 1871.	July 1 to Dec. 31, 1870.
Goods for consumption	$270,841,134	$226,974,461
Produce exported	198,216,725	182,670,285
Regular trade balance	$72,215,005	$41,304,176
Net specie outgo	25,216,725	39,659,207
Apparent balance	$46,998,280	$4,644,969

The following are the comparative movements of the City Banks for the past fortnight:

	March 23.	March 30.
Capital	$87,155,500	$87,155,000
Loans	259,938,000	277,761,500
Gold and Greenbacks	62,152,200	62,951,900
Deposits	200,019,300	205,717,000
Circulation	23,008,700	23,018,300

PRICE OF STOCKS AND BONDS.

Western Telegraph	73¾	Adams Express	95
Pacific Mail	63¼	American Express	73
N. Y. Central Stock	96	United States Exp's	71

The changes in our table since last week are all in favor of the market. Most of the railroads are 2 per cent. higher, and some of them 3@4 per cent. up. Erie is exceptional, and after going up to 63 per cent., or *eighteen* per cent above our previous quotation, fell to 58@58¾ per cent. The gold market is ⅛ per cent. higher, and U. S. bonds ¼@⅜ per cent. higher. The market, near the close of the week, is buoyant in the spirit of speculation, and active in the amount of business doing.

PRODUCE AND PROVISIONS.

NEW YORK, Friday, March, 29, 1872.

Receipts.—The receipts of the principal kinds of produce since our last embrace 7,712 bales of cotton, 138 pkgs. dried fruits, 11,677 bbls. eggs, 43,576 bbls. flour, 12,700 bush. wheat, 165,900 bu. corn, 57,401 bu. oats, 5,100 do. barley, 2,551 sacks grass seed, 1,528 bbls. beans, 239 bags do., 33 bales hops, 4,441 pkgs. pork, 227 pkgs. beef, 13,019 pkgs. cut meats, 9,057 pkgs. lard, 5,763 pkgs. butter, 4,558 pkgs. cheese, 1,502 bags peanuts, 902 hhds. tobacco, 5,133 boxes do., 4,585 bbls. whisky, 555 bales wool.

Butter.—There are no new features. Old continues to close out upon arrival, even when possessing only a moderate claim to table quality, and new is selling ahead for Eastern use. A portion of Canadian stock is reported ready for the markets over the line, but it is likely that Eastern cities will absorb it before New York. Fine Welsh butter is about used up.

State dairies, fine, 35@36c.; State dairies, fair to good, 29@32c.; State, half-lots, good to fine, 30@33c.; State, do., common to fair, 28@32c.; State, firkins, fine yellow, 31@33c.; State Welsh, good dairies, 31@33c.; State do., common to fair, 25@30c.; State do., fresh made, 35@37c.; State, fancy select tubs, 38@43c.; rolls, good Western, 22@25c.; common to fair, 12@18c.; grease butter, 9½@10c. New white butter, 32@33c.

Beans and Peas.—Medium beans have been bought up freely, and prices are about 5c. higher. Marrowfats are working more in the seller's favor. Kidney, prime, $3.25@3.35; do. good, $2.60@3.15; do. red, good to prime, $2@2.50; mediums, prime, $2.80@2.85; do. good, $2.50@2.75; do. common to fair, $1.95@2.10; Marrowfats, prime, $3@3.10; do. good, $2.70@2.90; do. common to fair, $2.30@2.50; pea, prime, $2.85@3; do. good, $2.40@2.60. Peas $1.20@1.22 for Canada, free, in bbls., and $1.50 for green, and $3 for Southern black-eyed, per 2 bushel bag.

Beeswax—Is scarce and higher. Quoted at 38@38½c. for choice Southern.

Broom Corn—Is offered freely at weak prices. New hurl, 7@9c.; new green, 5@7c.

Cheese.—There is sufficient home trade to keep prices on a steady basis. There is scarcely any shipping inquiry. A few small lots of new have been received, and old stock is coming in freely.

Quotations are: Fine State factory, 20c.; good do., 18@19c.; ordinary, 14@16c.; State farm dairy, prime, 17@19c; Vermont factory, 18@19c.; Ohio factory, good to fine, 17@18½c.; English dairy, 16@17c.; pine-apple, State, 17@19c.

Cotton.—There have been some large parcels taken for export, and there is a steadier tone to the market. Holders offer a fair quantity of stock at current prices.

	Uplands.	Alabama.	N. Orleans.	Texas.
Ordinary	20⅜	20½	20⅝	21
Good Ordinary	21⅛	22	22¼	22¼
Low Middling	22⅝	22⅞	23	23⅛
Middling	23¼	23⅜	23½	23⅝
Good Middling	24	24⅛	24⅜	24⅝

For forward delivery latest sales on the basis of low middling are as follows:—March, 23c.; April, 23¾c. May, 23 5-16c.; June, 23¾c.; July, 23⅝c.; Aug., 23⅜c.; Sept., 21½c..

Dried Fruits.—The stock of apples is in fewer hands, and prices have been advanced about ¼. The home trade is better. Unpeeled peaches have sold more freely, and at firm prices.

Apples—Old State, qrs., 7@8c.; Western, new, 9½@10c.; Southern, new, qrs., 8@8½c.; do. fine, sliced, 12@13c.; new State qrs., 10@10½c.; do. sliced, fine, 13@14c. Peaches, peeled, new N. C., 17@17½c.; do. Geo., 15@16½c.; peeled E. Sh. Va., 15@16½c.; new unpeeled halves, 7½@8c.; do. quarters, @6. Plums, 25@27c. Cherries, new, ₱ lb., 30c. Blackberries, 13½c. Raspberries 28@30c.

Eggs.—The cold weather a few days since created considerable speculative inquiry, and prices advanced to 26c. At the close there is more disposition to realize with sales at 22@23c.

Fresh Fruits.—Prime apples bring higher prices. Cranberries are in light stock and held firmly. Peanuts are in more demand. We quote:

Apples, good, barrels, $1@1.50; do. selections, $5@5.50 do. poor, $2.75@3; cranberries, fine, bbl., $14.00; do. crates, fine, $5; do. do. common, $3@3.12; oranges, Le., bbl., $14@15; peanuts, Wilmington, bush., $2@2.25; Virginia, new, $2@2.20; do. common, $1 25@1.50; hickory nuts, $1.75@2; Persia nuts, ₱ lb., 8@9c.

Flour.—There is a very fair home trade at the low prices, but the export movement is moderate. Medium and high grades are firm.

The quotations are at $6.20@6.55 for superfine State; $6.70@6.95 for common extra do.; $7.00@7.10 for good to choice do.; $7.15@7.45 for fancy do.; $6.20@6.55 for superfine Michigan, Indiana, Ohio, Iowa, &c.; $6.55@6.85 for extra do.; $7.00@7.20 for choice extra do., including shipping brands of round hoop Ohio at $6.95@7.15, and trade brands of do. at $7.20@7.35; good to choice white wheat extras at $7.50@8.25; Minnesota, fair to very choice extra, at $7.00@8.50; St. Louis at $6.90@7.60 for common to fair extra, and $7.65@9.50 for good to choice. Southern at $6.30@7.10 for extras and $7.10@9.50 for good to choice. Rye at $4.00@5.10.

Grain.—For wheat the market closed steadily. There is more milling demand, and exporters are making a few purchases. No. 2 spring in store, $1.50@1.53. No. 1 do., $1.55@1.57, winter red Western, $1.67@1.70, amber do., $1.70@1.75, white Western, $1.73@1.80. Rye is quiet at 88½c. for Western. Oats are in the buyer's favor, with a dull market. Sales at 53½@56c. for Western, in store and afloat, 56@58c. for white Ohio. Barley is quiet at weak prices. Sales of two rowed State at 70c. delivered. Corn is held firmly, with a good trade for export and home use. Sales at 71½c. for Western mixed, afloat, and 73c. for Western yellow.

Hay and Straw.—The stock of hay is very light, and, with a few orders from shippers, prices have advanced temporarily to $1.35@1.45 for shipping. Prime qualities, $1.35@1.50. Long rye straw sells at $1.05@1.10.

Hops.—The stock is so small that holders are quite indifferent. A few sales are making at late prices.

New Yorks, growth 1871, 25@35c.; Eastern do. 1871, 25@60c.; Western do. 1871, 25@60c.; yearlings do. 1870, 10@30c.; olds do. 1869, 10@15c.; old olds do. 1868, 8@12c.; Californians do. 1870, 15@25c.; Californians do. 1869, 10@15c.; Bavarians, 65@75c.; English, 60@65c.; Belgians (nominal), 50@55c.

Provisions.—Pork has been pressed for sale. Sales of mess at $12.75 for April, and $13.12½ for June. Bacon is in good demand, and firm at 7¼c. for Western short clear, 6¾@7c. for do. long do., and 7c. for city do. Dressed hogs are quiet at 5¾@6¼c. for packing, and 6¾c. for pigs. Tallow is steadily held at 8¾@8¾c. Lard is steadily held, with a fair inquiry. Prime Western steam, 8¾c.; for April, 8 15-16c.; for May, 9¼c.; for June, 9¾c.; city quiet at 8¾@8¾. Beef is quiet. New plain mess, bbls., $8@11; extra do., $10@12; prime do., tcs., $14½@18; India, do., $18½@20. Cut Meats.—Small lots are selling at the annexed prices: Smoked hams, 10@12c.; city smoked shoulders, 6½c.; pickled bellies, boxed, 7½@8.; do. loose, 7c@7½c.; pickl'd hams, 8½@9½c.; do. shoulders, 5@5½c.; shoulders, in dry salt, boxed 5@5¼c.; fresh hams, 8½@9½c.

Poultry and Game.—Dressed poultry scarce and high. Live also better. Wild pigeons not abundant, but buyers will not pay high rates, anticipating sudden free receipts. Wild ducks lower.

Turkeys, good, 20@25c.; Ducks, Western, 25@28c. Fowls and Chickens—Western and State, 20@22c.; do. Bucks Co. and N. J., 25@28c.; capons, 33@35c. Live, State and N. J., 18@20c. do. Western, 18@20c.; roosters, 13c.; ducks, per pair, $1@1.12. Geese—Western, $1.50@1.75; do. Canada, $1.75@2; do. Jersey, $3@3.50; turkeys, 20@22c.

GAME.—Rabbits per pair, 35@45c.; hare do., 40@50c.; canvas backs $1@1.75, red head 80@$1, mallard 50@60, widgeon and teal 50@60c.; black duck, 75c.; English snipe per doz., $3; squab per doz., $1; wild geese each $1.; wild pigeons, per doz., $1.50@2 picked.

Seed.—The Stock of clover is more concentrated, and prices are higher. Sales at 9c. for prime Ohio; 9¾c. for Indiana, and 10@10¼c. for State. Timothy meets with more attention, quoted at $3@3.50 for common to prime.

Tobacco.—The market has been moderately active for Kentucky leaf to meet wants of the home trade. Seedleaf is selling well at steady prices. Our quotations are for old crop. Lugs quoted at 7¼@8½c.; common to medium leaf, 8½@10c., and selections up to 15c. Conn. and Mass. wrappers, 25@40c.; selected do., 45@55c.; fillers, 15@16c.; Ohio assorted, 16@20c.; do. wrappers, 30@40c.; Pa. and Ohio fillers, 12@15c. Havana fillers, common, 85@87½c., gold; do. fair, 90@97½c.; do. fine, $1@1.10, gold.

Vegetables.—There is a better supply of potatoes from near points, and prices are rather weak. Onions are in the seller's favor. Our quotations are for bulk lots.

Potatoes, Early Rose, bbl., $2.00@2.50; P. Blows, $2.25@2.50; Prince Albert, $1.75@2; Monitor and Goodrich, $1.25@1.50; Jackson, $1.60@1.75; Dyright, $1.50@2; Nova Scotia, $1.75; sweet Del., $3.75@4.00. Onions, red and yellow, $2.25@2.50; white, $3.00; Conn., 100 strings, $3. Garlic, per 100 bunches, $22@24. Turnips, Russia, bbl., $2. Cabbages, per 100, $6@8. Hubbard squash, per bbl., $5; marrow, $5. Beets per 100, $1.25. Carrots per 100, $1.50.

Whisky—Is quiet, at 87½@88c. for Western.

Wool.—There is more inquiry for fleeces from manufacturers. Full late prices are obtained. Texas and California grades are quiet. Sales at 56c. for unwashed fleeces; 78@80c. for super pulled; 57@60c. for Texas; 37½@39½c. for California fall, low; 38c. for lambs; 45@48c. for Cape.

ROCHESTER, N. Y., March 28.—The wheat market is active, excited and irregular. Notwithstanding the decline in England, the local scarcity and poor prospect for the coming crop makes our millers free buyers at an advance. We quote red winter, $1.55@1.60; white, $1.65@1.82, according to quality. Corn dull at 68@70c. Barley no sale, nominal at 60@75c. for two to four-rowed. Dressed hogs, $6.75@7 per cwt. Butter scarce, and best is 2@3c. higher, selling 30c. Eggs lower and irregular at 20@24c. ₱ dozen. Potatoes are scarce and higher, selling at 55@60c. for Peachblows, and 60@70c. for Early Rose. Wool market quiet and rather easier. Sheep pelts $3.00@4.50 each. Clover seed dull at $5.75@6.00. Timothy seed dull at $3.05@3.50. Hay $16@23 per ton.

LIVE STOCK MARKETS.

NEW YORK, March 29, 1872.

AS Lent draws towards a close cattle men increase their shipments under the impression that more beef will be eaten, but warmer weather, abundance of eggs and plenty of veal rather check the demand just now. There is much complaint of stock bruised upon the cars while bringing here, and butchers talk of organizing and refusing to pay full prices for cattle which show bruises sufficient to lessen their value when rolled. The following are the receipts of live stock

for the past fortnight, for the same time last year, and the average weekly arrivals for all of 1871:

TOTALS LIVE STOCK FOR THE WEEK.

	Beeves.	Milch Cows.	Calves.	Sheep.	Hogs.
This week	7,968	115	1,340	15,282	25,929
Last week	6,311	146	1,467	16,656	20,180
Correspond'g w'k '71.	7,023	68	1,386	20,201	18,502
Average, '71	7,187	88	2,301	25,132	25,177

Beeves.—The supply of close upon 8,000 cattle during the past week does not materially affect the market. Fat cattle continue in good request and at full prices, all selling, while thin lots show a little weakness at close, with some left over. Still they are higher than they were one week ago, all kinds advancing ½@¾c. last Monday, with 4,157 head on sale, 135 cars at Communipaw, 88 at 100th street, and 15 at Weehawken. Some of the droves of that day were very fine, and He. was reached for the best; one whole drove averaged that price, but they were extra fine 9½@10 cwt. O. grade Durhams, on which the feeder had bestowed much care. The stock of to-day comprised 12,761 head, and the quality was only fair. Two cars of Cherokee were very good for that class of stock, and sold for 12½c., though only 6 cwt. We are beginning to receive some still-fed cattle which usually come to market later. The high prices are bringing them forward sooner than usual. Some of the Texans have been fed at the distilleries and did very well. The largest shipper of stock, N. Morris of Chicago, sent in 2,150 cattle during the past week. One drove of 250 fair to good 7 cwt. Ill. cattle sold to-day at 12@13½c., with two cars little thin 5¼ cwt. steers at 10½@10¾c.

The following are the closing prices for the week, in comparison with what cattle brought one week ago, for net weight of beef:

	This week. Cents.	Last week. Cents.
Choice beeves, ₩ lb	13¾ @ 14	13 @ 13½
Good to prime	12¾ @ 13	12 @ 12½
Ordinary to medium	11½ @ 12	11 @ 11¾
Lowest grade	10¾ @ 11	10 @ 11
Average sales	12 @ —	11¾ @ —

Milch Cows.—Receipts lighter, good cows doing better, though there is nothing to encourage sending in stock from the country. With a very good prospect for early cheese and butter, we think cows are really worth as much in the country as they are here. In fact, we saw one car which so disappointed the owner in the prices offered that he took them back into the country to peddle out among the farmers. Prices here are $25@40 each for poor cows; $45@65 for rather ordinary to fair, and $70@80 for good to choice; only selections bringing the latter price.

Veal Calves.—The supply has been rather light during the past week, but indications point to a large increase now. We have been having many hog-dressed calves, the late cool weather being very favorable for sending long distances, as well as holding after they arrived. As a general rule live calves are a shade lower, while dressed rule higher. Dealers here object to receive dressed "tub veal," for the Sanitary Inspectors are pretty sure to seize it. If alive, they are bought up at $15@$ each, and sent into the country to take the place of older ones just sent to market. In that way a cow rears several "crops" of calves in one season. Live calves are quoted at 5@10c. ₩ lb., fair veals of 140 lbs. selling at 9½c. to-day. Dressed sell largely at 8@10c., with prime at 12@13c., and very few indeed at 14c.

Sheep and Lambs.—There is very little difference in prices of sheep, but some of the late arrivals have been of better quality, hence sold higher. Prime State and Corn. sheep of 115@120 lbs. sold at 10¾ cts. Nothing, however poor, sells below 7½c., and scarcely any lots under 8c. One car of less than 90 lbs., very poor, went at 7½c., while three cars O., 87 lbs., brought 9½c., one car 88 lbs., 10c., and a car 119 lbs., 10¾c. Lambs begin to come forward again, about 100 being received to-day. They weigh from 40 to 50 lbs., and sell at $5@8 per head, or 15@18c. per lb.

Swine.—Western dressed are no longer of any account, only 700 arriving during the entire week. They are not quotable. Trade is dull and prices lower, live selling at 4¾c. for one car 193 lb. O., up to 5c. for pigs. Something very fine might reach 5¾c. City dressed are worth 5¾@6¼c. as extremes, those of 200 lbs. selling at 6c.

SPECIAL NOTICES.

DR. NICHOLS

is a *successful farmer* and *practical chemist*. See Farm Experiments at Lakeside; The Relations of Water to Agriculture; Farm Penciltings at Lakeside; The Food of Plants; What Shall we Use for Water Pipes, and other valuable papers in his interesting book, FIRESIDE SCIENCE, just published by HURD & HOUGHTON, New York. The Riverside Press, Cambridge. Price $1.50.

Good Results are always noticed in the use of *White Pine Compound. Try it* for all diseases of the Throat, Lungs and Kidneys, and see if it is not so.

New Advertisements.

CHEESE Factory wanted to locate in the Artesian Well region of Illinois. Send for a description of the best dairy country in the United States. Address E. RUMLEY, Gilman, Ill.

TIN-LINED LEAD PIPE

Is a Block-Tin Pipe, heavily coated with solid lead. It is the best and cheapest Water Pipe when strength and durability are considered. By its use, Iron rust, lead and zinc poison are all avoided, and general health promoted. Price 15 cts. a pound for all sizes. Circulars and sample of pipe sent by mail, free. Address the COLWELL, SHAW & WILLARD M'f'G Co., No. 313 Centre Street, New York.

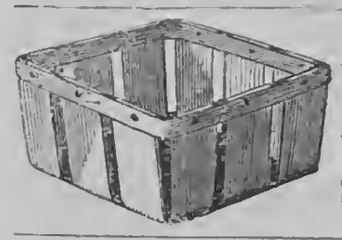
Also, Manufacturers of BLOCK-TIN PIPE, SHEET LEAD, LEAD PIPE, SOLDER, etc. Orders solicited and filled at sight.

AGENTS WANTED for "Convent Life Unveiled," by Edith O'Gorman, Escaped Nun, whose disclosures are thrilling and startling. Agents are taking from 10 to 20 orders a day. CONN. PUB. CO., Hartford, Conn., or WEST'N PUB. CO., Cincinnati, Ohio.

ASTHMA! A CURE SPEEDILY EFFECTED.—In order to place PISO'S ASTHMA CURE within the reach of every person afflicted with Asthma, the price has been reduced to 50 cents a box. By mail 75 cents. Trial package free. Address S. C. PISO, 25 South Eighth Street, Philadelphia, Pa. Sold by all Druggists.

Pomeroy's Trusses.

Unrivaled for the relief and cure of Hernia or Rupture. POMEROY & CO., 741 Broadway, New York.



THE
AM. BASKET CO.,
New Britain, Ct.,

Manufacturers of the best and cheapest Verbena Basket, Berry Basket and Crate in market. Are selling this year at a great reduction for cash.

Circulars free.

WEBSTER'S PATENT
BUTTON-HOLE WORKER.

Patented June 27, 1871.

One of the most important inventions of the age! The most perfect Button-Hole Worker ever invented! So simple that a child can work a more perfect button-hole with it than the most experienced hand can work without it. Every stitch is taken with the most perfect mechanical accuracy. Is used entirely independent of the sewing machine, and will last a life-time. Does away with pricking the fingers, straining the eyes, and with imperfect and irregular worked button-holes. They give universal satisfaction. Ladies who use them say that they are worth their weight in gold. Over 11,000 sold during the first week of their introduction. The most liberal inducements offered to the trade. Dry Goods and Fancy Goods Merchants find it an excellent selling article. Local and travelling agents wanted everywhere.

Samples and terms, with full directions for use, sent prepaid on receipt of 50 cents. Orders by mail receive prompt attention. Address

Paints, Oils, Blacking, &c.

ARE YOU GOING TO PAINT?
MORE THAN
100,000 HOUSES
HAVE BEEN PAINTED WITH THE
AVERILL CHEMICAL PAINT
IT IS THE BEST

In the world for exterior work upon Cottages, Villas or Buildings of any kind, whether built of brick, wood or iron. It is a liquid, *ready for use*, and requires no oil thinning or drier. Purest white, and any desired shade can be had in packages from one gallon upwards.

Letter Received from Levi Shaw, Trustee of the United Society of Shakers.

MT. LEBANON, N. Y., Sept. 27, 1871.

RESPECTED FRIENDS:—In reply to your inquiry as to what we think of the Averill Chemical Paint, we have used in our Society at Mount Lebanon some 1,000 gallons. We are very much pleased with it, and until we are convinced that there is something better, shall give it the preference of all other paints. We have used heretofore the (——), (——), and most all other brands of white lead, neither of which have given us perfect satisfaction. Most of it would chalk off after being on some two or three years. This, after three years' experience, we do not find to be the case with the Averill Pure White Chemical Paint. Indeed, it appears just as well as when first put on. I will write you again on the subject when I am not in quite so much of a hurry.

Sample card of beautiful colors, and recommendations from owners of the finest residences in the country, furnished free by the

AVERILL CHEMICAL PAINT CO., 32 Burling Slip, New York, or 118 Superior St., Cleveland, Ohio.

P. S.—The superiority of these Paints has already brought numerous *worthless* imitations in the market. We caution the public against using them.

The Season for Painting
HAS COME AGAIN.

If you propose to paint, first send stamp for a book called "Plain Talk with Practical Painters, with Samples of Colors." The book is worth a dollar, and costs nothing. JOHN W. MASURY, 111 Fulton St., New York. ☞ Specialty in Pure Paints and Colors. Masury's Ready-Made Colors are the only ones which stand the test of time. Do not be deceived.

P. O. Box 2564. 90 Ann St., New York.

CARHART'S
PATENT TWO-HORSE
Pulverizing Cultivator

Was Awarded the First Premium at State and County Fairs in 1870 and '71.

It is superior to the best Wheel Cultivator.
The price is only Twenty Dollars.
The draft is reduced nearly one-half.
The depth you wish it to run is regulated without the use of wheels.
It can be drawn close to a tree or plant without injuring it.
It is not disturbed by short undulations of earth, like the Wheel Cultivator, but pulverizes, levels and fits the ground for the Mowing Machine better than any Cultivator in use, and can be used for more purposes than any other implement on the farm.

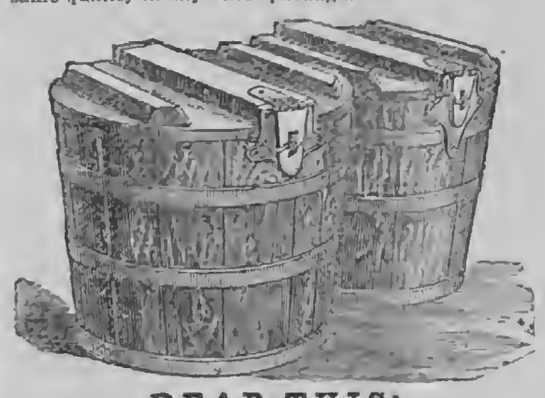
FARMERS, DAIRYMEN AND BUTTER BUYERS!
PACK YOUR BUTTER
IN
WESTCOTT'S
RETURN BUTTER PAIL

Approved and recommended by the leading authorities of our country on dairying, and acknowledged by all butter dealers to be the very best package in use. Butter packed in this Pail brings **5 to 10 cents more** a pound in the New York City market than the same quality in any other package.



READ THIS:

NEW YORK, Nov. 15, 1871.

We, the undersigned, Produce Commission Merchants of the City of New York, consider Westcott's Return Butter Pail, manufactured by Silsby Bros., Belmont, N. Y., *the best package in the market*. It is our experience that Butter packed in this Pail *sells more readily and commands a higher price* in this market than in any other package, and we heartily recommends its general use by the dealers, dairymen and butter buyers who ship to this city.

Respectfully,

(Signed by 15 leading Commission Merchants.)

The Westcott Return Butter Pail meets my approval as a good butter package. It is one which I always feel safe in recommending.

X. A. WILLARD,
Dairy Editor Moore's Rural New-Yorker.

Dairymen, send for a Circular! Dealers, send for a Price List! We are the sole manufacturers of **Westcott's Return Butter Pail**, and also manufacture very extensively Butter Firkins, Half-Firkin Tubs, 25-pound Butter Pails, Well Buckets, &c., &c.

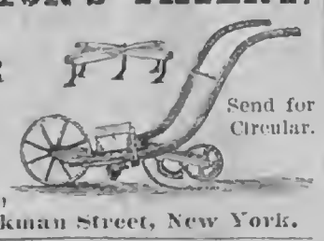
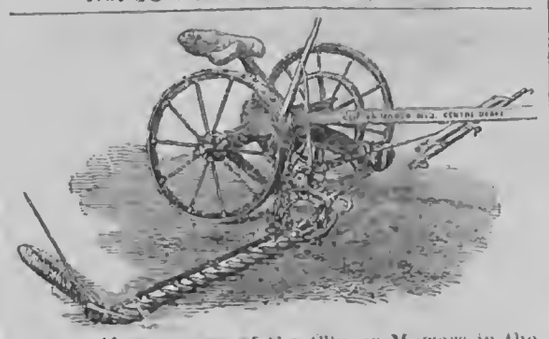
HARRINGTON'S PATENT.

The only Combined
SEED SOWER
And Cultivator.
Made only by
AMES PLOW CO.,



Send for Circular.

No. 53 Beekman Street, New York.



The *uniform success* of the Clipper Mowers in the field, the testimony of every farmer who has used them, that they are the *lightest in draft*, the *most durable* and the *most economical* machine for the farmer to buy, fully substantiates what the proprietors have always claimed—that the Clipper is the **Best Mower in the World.**

To the No. 4 size is attached the Dropper (cutting 5½ feet, with *separate Finger-Bar* for reaping), constructed with great improvements—in fact perfected; and in point of efficiency, strength, lightness of draft and symmetry of proportions, it is, as a Reaper, also unequaled. Farmers! see it before you buy. Pass your own judgment upon it. Look at its many improvements possessed by no other machine. Remember, it is fully warranted. Send for Pamphlet.

THE CLIPPER MOWER & REAPER CO.,
P. O. Box 6173. 151 Chambers St., N. Y.

Working Position.

Eureka Butter-Worker.

A lever-ladle works in all parts of common bowls, which are held firm; revolved easy; drained by the strength of one finger; very simple, strong, light, convenient to carry, detached, and washed readily as any bowl or ladle. It enables a person to wash, salt, press, rut, turn and work soft or hard butter in every manner desired, exactly on the hand-ladle principle, three times easier and faster, and not as liable to injure butter. It has received the highest honors at the N. Y. and Pa. State, Western N. Y., Am. Institute and Buffalo International Fairs; and very highly commended by thousands of dairymen. Tested and highly commended by X. A. Willard, and all sold give entire satisfaction. Three sizes, $7, $7.50, $8, shipped with bowls. Liberal discount at wholesale. Circulars and information on application. J. P. CORBIN, Whitney's Point, N. Y.

"FAMILY FAVORITE!"
THE
WEED. **WEED**

The most perfect, reliable and generally useful machine in existence. For the family of the farmer or mechanic, where the work required of a sewing machine ranges from the heaviest garments of men's wear to the most delicate and ornamental fabrics for ladies and children, it has proved itself thoroughly efficient and entirely satisfactory. Of unequaled simplicity and compactness of construction, capable of being learned and operated with one-fourth the usual expenditure of time and labor, with a capacity for quantity, quality and variety of execution beyond its competitors, and a reputation for durability and reliability known and appreciated by thousands, it is offered to the people for the most critical inspection and comparison, with confidence that its obvious merits cannot fail to convince the careful examiner of its superiority. Manufactured by the

WEED SEWING MACHINE CO.,

COUX'S
PATENT ABSORBENT CLOSET & URINAL.

"The Goux system possesses all the advantages of the dry earth system without its disadvantages; it is economical, deodorizing and self-acting. The whole refuse of every house, as excreta, liquid or solid, ashes and sweepings, are disposed of and turned to account, and it is applicable in individual cases, dwellings, and in large communities. The alterations to the ordinary closets, to adapt them to the dry system, are less costly in the Goux process than in any other, and it is applicable to the best description of houses, as well as to the dwellings of the poor."—*Scientific American, Jan. 1, 1872.*

DUNHAM & SONS,

(ESTABLISHED IN 1834),

Manufacturers of

PIANO-FORTES.

MOORE'S RURAL NEW-YORKER of November 18, 1871, says:

"Having used one of their instruments in our family for twenty years, we can confidently commend them to our readers as being first-class in every respect. Both professional and amateur players on the piano pronounce our DUNHAM very superior in tone. An instrument that has retained its brilliancy and sweetness of tone for a score of years needs no further commendation."

17 Union Square,
NEW YORK.

AGENTS WANTED FOR

HISTORY OF THE GREAT FIRES

In CHICAGO and the WEST.

By Rev. E. J. GOODSPEED, D. D., of Chicago. The record of a grand city overtaken by sudden and awful calamity, of towns destroyed by the wasting element, of forests burned, of homes and farms desolated, of men of wealth made beggars, of families separated. Abounds with thrilling incidents of marvelous escapes, etc., and is the only complete History of these great events. 600 8vo. pages; 50 Engravings; price $2.50; outfit, $1. Secure the best territory at once. 70,000 already sold. The profits go to relieve the sufferers. Address H. S. GOODSPEED & CO., 37 Park Row, New York, or J. W. Goodspeed, Chicago, St. Louis, Cincinnati, or New Orleans.

Agents Wanted, $75 to $250 per month, everywhere, male and female, to introduce the GENUINE IMPROVED COMMON SENSE FAMILY SEWING MACHINE. This machine will stitch, hem, fell, tuck, quilt, cord, bind, braid and embroider in a most superior manner. Price only $15. Fully licensed and warranted for five years. We will pay $1,000 for any machine that will sew a stronger, more beautiful, or more elastic seam than ours. It makes the "Elastic Lock Stitch." Every second stitch can be cut, and still the cloth cannot be pulled apart without tearing it. We pay Agents from $75 to $250 per month and expenses, or a commission from which twice that amount can be made. SECOMB & CO., *Boston, Mass.; Pittsburgh, Pa.; Chicago, Ill.; or St. Louis, Mo.*

ELK, MOOSE, OR MOOSE DEER.—[See Page 233.]

A Safe and Profitable Investment.

BANKING HOUSE OF JAY COOKE & CO.

The Treasury is now paying off the called 5-20s of 1862. Holders of these who desire to exchange them for a BOND OF EQUAL SAFETY, and at the same time increase their annual income nearly ONE-THIRD, will do well to investigate the merits of the 7-30 GOLD BONDS OF THE NORTHERN PACIFIC RAILROAD.

These securities, the present price of which is PAR and accrued interest in currency, are selling rapidly for cash, and in exchange for 5-20s, and we commend them to investors as confidently as we have always commended the Bonds of the United States Government.

They are secured by a FIRST and ONLY mortgage upon 2,000 MILES OF RAILROAD, ITS EQUIPMENT AND EARNINGS, and, in ADDITION, as fast as the Road is built, upon 500 acres of land to every $1,000 Bond, or 23,000 acres to every mile of road.

The Bonds are thus a first-class Railroad Bond COMBINED with a Real Estate Mortgage on land worth at least twice the amount of the Company's liabilities.

Northern Pacifics are issued in denominations from $100 to $10,000, Coupon and Registered, and their heavy sales in this country and Europe assure the rapid construction of the road.

The Bonds are FREE FROM UNITED STATES TAX to the holder, have 30 years to run, principal and interest payable IN GOLD, at the Banking House of Jay Cooke & Co.

All marketable securities received in exchange, without expense to the investor, at their highest current value.

JAY COOKE & CO.,

The Poultry-Yard.

CANKER IN FOWLS.

I SEE that "A Subscriber," San Antonio, Texas, has lost some of his fowls with a disease new to him and which, as he says, has not been made note of in any of the poultry works. I have never seen the disease mentioned in any of the works either. The disease is *Canker*, which affects both the throat and eye, and, if not speedily checked, eats its way inward to the brain. It first appears (generally) in the throat, though sometimes I have seen the eye attacked and the throat remain perfectly clear through the whole disease. The eye first commences to swell, and waters quite freely for a day or two, the swelling increasing all the time, sometimes reaching the size of a small walnut; upon being opened, it is filled with a hard, yellow matter, which is very offensive.

I have found this easily cured by bathing the eye with tepid water and vinegar, letting it run well into it and then squeezing lightly around the eye, which loosens the matter from the skin; by drawing the lid back and pressing outward the whole mass can be taken out in a ball. I have had cases where the fowl recovered entirely in three days, only being obliged to squeeze out the substance once; others have been of longer duration, where I have been obliged to scrape out around the eye for many weeks (once or twice a week) with the ear end of tweezers. In one instance I was obliged to remove the entire eye from the fowl. I have never lost a fowl from the disease yet. Diluted carbolic acid is also very beneficial to cleanse with after the substance has been removed.

Taken in its early stages, there is no trouble to cure it. The fowls, of course, should be separated from the rest, as it is contagious. I have never known *one* to have it without others following soon after.

Tremont, N. Y. EDWARD A. ROWE.

TOO MUCH FEED.

IN answer to your Texas correspondent, whose chickens have died with that strange rattling disease, I have to report the same among my hens for the first time this year; but very few died, however, except from another disease, which I call diarrhea. I have lost, every year for the last three years, about one-third of my stock. About the first of March every year they begin to drop off. For the first two years I could not in any way account for it; but I am now satisfied that it all comes from overfeeding, and that the disease will be worse where hens are fed a long time on the same kind of food.

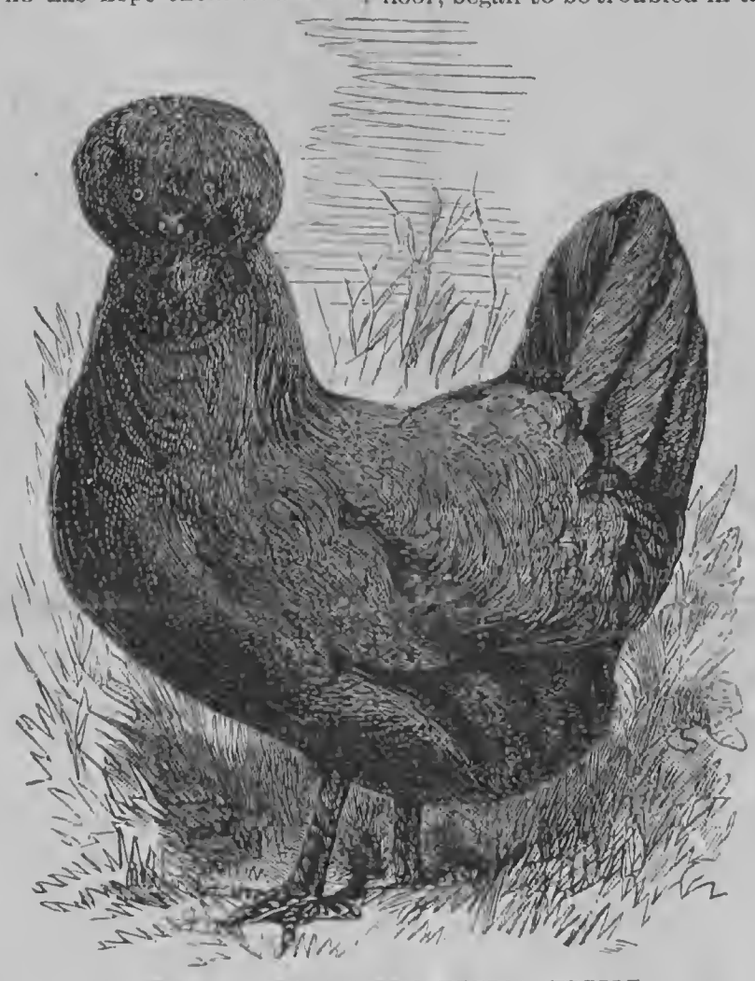
I feed my hens very high, in order to make them lay; and I get my return, as you will see. I keep about sixty, and I have had more than twenty-five eggs a day straight through the winter. As a rule the hens which lay all the time get through all right; but those which do not lay cannot stand the high feed.

As to remedies, I have tried everything, and am satisfied it is only a waste of time to doctor a hen. In my opinion the only thing to be done with a sick hen is to take her away from the rest, put her in a dry place, give but little to eat, *and no water for several days;* this should be done the moment she is seen to move slowly around the yard, with her tail drooping.

Westchester Co., N. Y. N. W. RIKER.

POULTRY NOTES AND QUERIES.

Weak-Legged Chickens.—I would say for the benefit of W. T. TRESCOTT, that if his chickens that are troubled with weak legs are (as I suppose they are) this year's chickens, and he has kept them on a hard boarded floor, there is no hope for them unless he takes them off of such a floor, or covers it with from three to six inches of horse manure or soil. Last year a friend of mine undertook to raise her chicks in the barn. When about five weeks old they became lame, and grew worse until they had to use their wings to help them walk. Half discouraged she put them out into the barnyard, and every one of them got better. Two weeks ago, my chicks, then about five weeks old, and which had been on a hard floor, began to be troubled in the same way. I covered the floor with dry horse manure, leaves and sawdust, and they are much better, and I doubt not will recover.—J. H. Y.



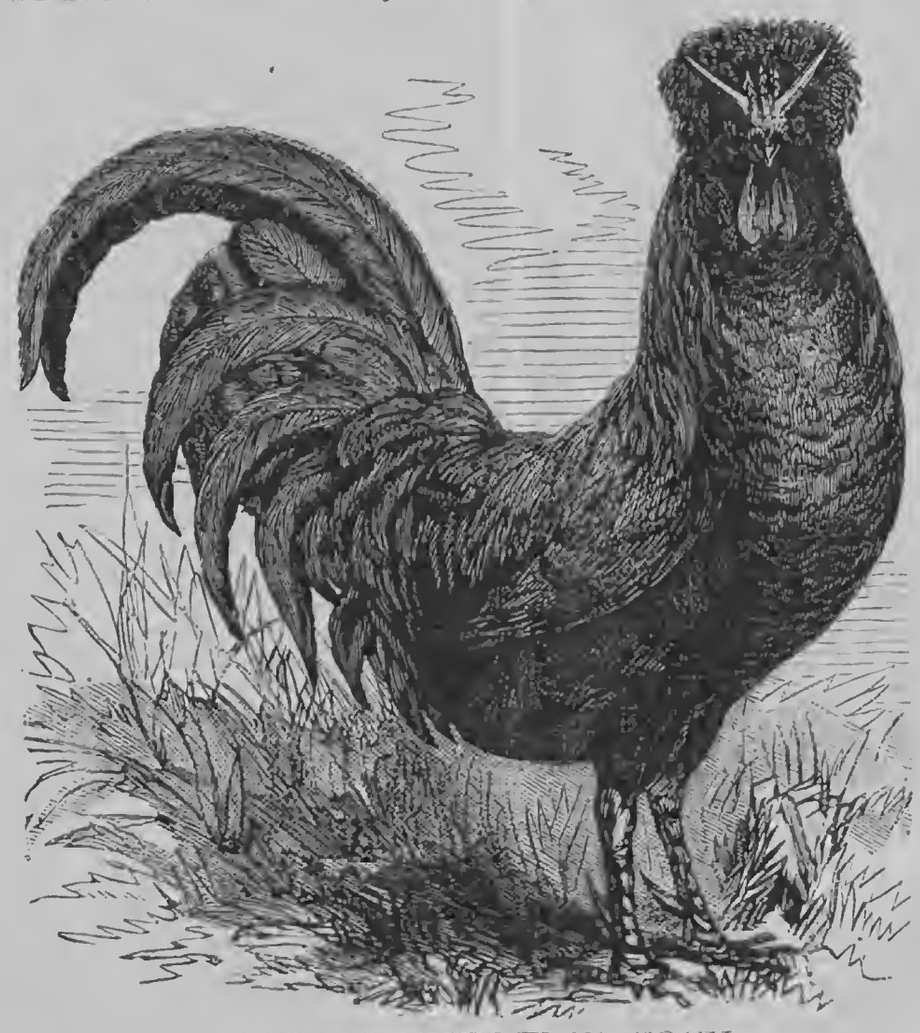
PRIZE CREVECŒUR HEN.

Silver Spangled Hamburgs.—C. F. TYLER asks:—"What quality have Silver Spangled Hamburgs to commend them except beauty? Will they endure confinement well?" We cannot answer this question satisfactorily, since we have never kept them. Let others, who have, reply.

To Rid Canaries of Lice.—I. H. B. asks how to rid his Canaries of lice. A friend of ours, having large experience, uses for perches in the cages sticks of the common elder (*Sambucus Canadensis*), from which the pith is removed and notches cut in the upper side of the perch at distances of one-half to one inch; thus a series of holes connecting the exterior and interior of the perch are made. As the birds purge, the lice leave them and creep into the interior of the perch. Each morning the perch is removed and the lice jarred out on to a piece of white paper and destroyed. We have also heard that lice will not stay on a bird or fowl that sits on a sassafras perch.

Remedy for Hens Eating Eggs.—Build a laying-room a little dark, so that they cannot see to do that kind of mischief. Hens naturally like to retire out of sight to lay, in a snug, cozy place. It prevents hens that are laying from being disturbed by going into the house; and strolling hens do not bother, for they cannot see to pick. A room six by eight feet, is large enough for seventy-five or one hundred hens; for it will accommodate twenty nests or more. Shelves are necessary to set the nests upon, with a projection in front for the hens to walk on.—GEORGE F. BAKER.

Prize Crevecœur Fowls.—We give herewith, portraits of English Crevecœur fowls, which have recently won prizes at English exhibitions. They are the property of ROBERT B. WOOD, a gentleman with whom many American importers have probably dealt. The cock won cups at the Warrington and Cheltenham shows of 1871, and the hen was the winner of first prizes at Birmingham and Wolverhamptom, a second prize at Strand, and a third prize at Bristol. We illustrate them as types of first-class birds bred by English breeders.



PRIZE CREVECŒUR COCK.

When to Pluck a Peacock's Tail Feathers.—I have a male bird of the peacock species that has a magnificent tail. I am desirous of saving the same, but am ignorant of the time when the feathers should be plucked. What is nature's time? When are the feathers fully matured? etc., etc. Please say in the RURAL when is the proper time, and give such other information as is needed.—JNO. C. WADE.

WE have never kept a peacock and cannot answer.

Houdan Pullet Ailing.—W. C. B., Potsdam, N. Y., has a Houdan pullet that stands with her head a little one side all the time; and frequently, when she begins to walk, twists her neck, turns her head bottom side up, runs backwards and generally rolls over once or twice before she gets straight again. Has been so since last summer; eats well. Asks some poulterer to give cause and remedy.

Inquiries for Poulterers.—J. MALLON asks where he can buy Japanese Bantams. . . . . P. BREIDING asks who has La Fleche fowls to sell. He wants a pair or a trio. . . . H. W. DEWS asks if there is any remedy for hens when their eggs break before being laid; also for the best method of nest building. . . . . J. A. K. has hens with large, rough legs, sore and lame; wants to know what ails them.

Industrial Topics.

FREE SEED DISTRIBUTION.

In the RURAL NEW-YORKER of the 30th ultimo, I saw an article opposing the Commissioner of Agriculture purchasing domestic seeds for distribution. You know there was a resolution to this effect offered at the late Agricultural Convention at Washington; but, it was voted down; served it right, as the Commissioner can benefit the country and agriculture greatly by the distribution of some of the best seeds he can procure, because there are some farmers, even well to do, others are too poor, who have a prejudice against anything new, and will not risk a dollar or two for a bushel of extra seed corn or potatoes, but if they get them free they will plant them, thus benefiting themselves and the country.

Would you not be in favor of the Commissioner of Agriculture giving good seed to the Indians who have commenced, and those who wish to begin farming, also to some of the most needy farmers who have been burnt out by the great fires of the West? Surely he would benefit those farmers and agriculture immensely by doing so.—R. C.

WE reply:—We are opposed to compelling farmers, who have intelligence and enterprise enough to buy new seeds, to pay for seeds for their less enterprising, old fogy neighbors who are equally able to buy their own seeds. As long as such old fogies find they can get their supply of seeds free, so long will they depend upon them. It is every way unjust. Any man who is so big a fool or so bigoted in these days where there is no excuse for it, as to prefer to wait until somebody gives him something now in order that he may test it, does not deserve to be encouraged in his folly and stupidity; and this is just what the free distribution of seeds to such persons does; and it wrongs every live, working farmer who pays taxes and for what he gets profits by it.

We are not in favor of sending seeds, nor guns, nor ammunition, nor blankets, nor whisky to the Indians. We are opposed to the whole Indian policy which treats them as other than native born American citizens—that does not place them on an equality before the law with others, give them the same rights, exact of them the same respect for law as it does other citizens, and punish them in the same manner for any violation of law. We do not believe in encouraging pauperism anywhere. We do not believe in attempting to save the lives of those whose lives are not worth saving. We believe in compelling every man and woman to take care of himself or herself, and in giving them equal opportunities with others to do so. This whole Indian policy is a swindle upon the people. The Indians are of no benefit to civilization, except so far as they may become civilized, self-supporting and useful. The people pay more money annually to swindling contractors, Indian commissioners and agents than they do the Indians; and it is this fact alone which sustains what is called the "Indian Policy" of the Government. Otherwise they (the Indians) would be left to take care of themselves, as they ought to be compelled to do.

We believe in charity—in helping those who cannot help themselves—those who have lost the fruits of past industry by a great and unavoidable disaster; but that does not prove that free seed distribution by the Government is justifiable. Nor do we believe that the farmers of the country are so immensely benefited by this free distribution of seeds. We are opposed to it for reasons heretofore given—just as we should be opposed to the free distribution of books, newspapers, food, clothing, steam engines, postage stamps, stoves, tinware, etc., etc., by the Government; for any argument that may be adduced in favor of free seed distribution will apply with equal force in any one of these cases.

NOTES AND QUERIES.

Tobacco Ring.—There is quite a large amount of tobacco grown here, and we think there is the worst ring of buyers formed here that there ever has been. They are now offering from three to five cents a pound. They contracted last fall at from ten to twelve and a-half cents. Now it keeps going down. It is not as good a crop in quality as we usually raise; it is not well cured. The fall was too dry. The buyers claim that there are no good wrappers in it, but the best raisers here, and those who have been longest in the business, claim that there is some very nice tobacco. Can you give us any information? Every buyer that comes in joins the ring. They seem anxious enough to buy, but they will offer but six cents for the best lots.—SUBSCRIBER, *Albion, Wis.*

WE have instructed our reporters to find what Wisconsin tobacco is worth in this market. We have not heretofore quoted the crop of 1871; dealers seem to have no quotations for it. The best information obtainable will be found in our market reports.

The Horseman.

NOTES FOR HORSEMEN.

Wolf Teeth in Horses.—I saw in the RURAL NEW-YORKER Mr. JENNING'S affirmation in regard to wolf teeth in horses. I am certain that the teeth are dangerous to a horse's eyesight. A neighbor of mine had a young horse that became partially blind, and grew rapidly worse until the animal became totally blind. Before the horse became entirely blind he took her to a horseman to find the cause. He, upon looking in the mouth, discovered two wolf teeth. He immediately removed them, but they had remained too long. Then he gave his opinion as to why those teeth cause blindness. He said that a nerve connected this tooth with the eye, and the bridle, which any one that has had any experience, knows wears upon this tooth or teeth; and they being so small, the bit is a serious trouble, keeping them sore, and hence the effect, blindness.—H. BERKLEY.

Thorough-Pin.—W. C. B. Your young horse should have rest. When in the stable, fold a piece of rag several times, saturate it with water, lay upon it one dram each of opium and camphor; put these on the enlargement; upon the wetted rag put a piece of cork large enough to cover the thorough-pin, and over the whole a vulcanized rubber bandage. Keep up a constant and equal pressure. Take the whole off whenever the horse leaves the stable, and put it on again as soon as he returns. Sometimes it is better to use the bandage alone without the cork and cloths. An old farmer tells us he has cured both thorough-pin and windgalls by this means.

Remedy for Horse Pawing in the Stable.—Take a piece of small chain, a foot long, put a small strap with a buckle through the end link, find out which foot the horse paws with, and buckle the strap with the chain attached around the ankle. When he paws it whips the other leg, and he don't like to punish himself, so gives up the practice altogether. Put it on every night for a week; after that take it off and he will not do it any more. Do not use this remedy on a horse that kicks the side of his stall.—G. W. D., *New Haven, Conn.*

Freaks of Nature.—A few years since, my neighbor having a large pair of mares, thought to raise from them a pair of mules. After being served by the jack, he would find them mornings in his mowing field. When he went to drive them out he would set on them a large bull dog, of which they were very afraid. When the mule colts were foaled, they both had under jaws much the longest, like the bull dog, so they could neither suck or eat, and they both died.—D. LANDON.

Sore-Shouldered Mule.—Take a quantity of white oak bark, boil it down, in water, until strong. To two quarts of the liquid add one pound of alum, and use it freely on the mule's shoulders. I will guarantee a speedy cure. It is an excellent application for all horses' shoulders prior to beginning spring work.—T. R. C., *Meadville, Penn.*

To Cure a Balky Horse.—Take a piece of rope about twelve feet long, tie it close to the base of the tail, draw it down between the hind and fore legs, tie a whiffletree to the end and hitch thereto a horse, which start. I'll warrant a sure cure.—A. T., *Galway, N. Y.*

A Kicking Colt.—A subscriber asks how to break a colt of the habit of kicking in harness. He kicks when before a carriage with both feet, is very high strung, naturally ugly and very quick. Who has a safe and reliable remedy?

Inquiries for Correspondents to Answer.—D. KRAFT asks for a remedy for lice on horses. J. F. DAY asks those who have had experience to detail mode of treating horse-distemper.

Field Crops.

"THORBURN'S LATE ROSE POTATO."

AN article in the RURAL NEW-YORKER of February 17th, from GEORGE W. CAMPBELL, entitled "Seedling Potatoes vs. Sports," calls for the history of this potato. The article referred to places me in a bad position before the public, as it is well known to at least a portion of the people who are thus warned against being imposed upon that I am the producer of said potato. It was first discovered, propagated, and introduced by me. Therefore, I claim the privilege of giving its history, in order to defend myself from the charges brought against me by Mr. CAMPBELL, of attempting to impose upon the public a "degenerate sport" as a "new and desirable variety." It is the opinion of good judges, who examined them on my grounds, that they will effect a complete revolution in the potato trade. If quality and productiveness rule, I predict a popularity for "Thorburn's Late Rose," before the close of another season, not yet attained by any other winter variety.

In the autumn of 1869, when digging a large field of Early Rose, which had been entirely ripe for several weeks, a few hills were discovered, the stalks of which were green and the yield of tubers enormous—in fact, outyielding the neighboring hills of Early Rose at least three to one. At first I supposed some fertilizer, or some other local cause, had forced an unnatural growth and kept the stalks green. But a closer examination proved conclusively that such was not the case. The tubers were a brighter red at the seed end than the Early Rose, and the stalks were found to be more "stocky" and more upright in growth. The leaves were also thicker and more pointed, but numerous.

The next spring they were cut to pieces, of one eye each, and planted one piece in a hill, making three rows through the center of a large field of Early Rose. They did not come up quite as quick; but made a far larger growth than the Early Rose, although the latter had two to three eyes in a hill. The difference in growth was so marked that it could be seen at a great distance. When the tops of the Early Rose were entirely dead and ripe, these were as green and thrifty as ever. They ripened about with the Jackson White, thus having nearly the whole season to grow in. When dug, the three rows yielded more than nine rows of the others.

I had now enough to test their keeping qualities, which I find are unsurpassed. In the same cellar at planting time, when the Early Rose were so badly sprouted and wilted, as to be totally unfit for table use, these had not sprouted and were as crisp and solid as when first dug. A few that were kept back for the purpose of testing them, remained in good condition for cooking until the new crop of Early Rose came upon the table.

Last season, I planted 4¾ acres on a piece of ordinary clay loam soil. It was on a side hill, so steep that it had to be plowed with a side-hill plow. It was lightly manured before plowing with barn-yard manure. There was no other fertilizer used, except a light top-dressing of plaster when they first came up. The field was finished out with Early Rose. They maintained the same marked difference in growth, time of ripening, and yield as before. I had 1,260 bushels. On the same soil, and under the same treatment, the Early Rose yielded but 80 bushels per acre.

In table quality they are not surpassed by any. They cook very dry and mealy, and have a peculiar rich and delicate flavor. They grow very compactly in the hill, making them very easily dug. The valuable characteristics of this "Late Rose" are so distinctly marked, and have proved of so permanent a character for three years, that I do not hesitate to pronounce them positive and fixed. It is *not*, as has been affirmed, a "sport of a single season, whereof the producers can give no history or support as to its reliable permanency." But it *is* a thoroughly tested and invaluable variety of the Rose family. I had a few of them planted last season in different sections, and in every case with the same result. In every instance, they have proved enormously productive, very hardy, and of excellent table quality.

I have no "ax to grind" in making this communication, as I have no "Late Rose" to sell. I would here earnestly caution the public against purchasing "Late Rose" from irresponsible parties. They are being offered under that name of all colors, shapes and sizes. The comparatively low price at which they are selling places them within the reach of all. One good eye to each hill is all the seed required. They are such strong, thrifty growers, that even with that small amount of seed, the ground will be covered with vines. Two barrels are sufficient to plant an acre, making the cost of seeding an acre but $20. This is the first time that a really valuable potato has been placed before the public at reasonable rates. On the same soil and under the same treatment "Thorburn's Late Rose" will yield *as much* as that wonderful producer, the "Peerless." I do not claim for it, as Mr. CAMPBELL does for his seedling, that it will yield so very much more than that variety.

It seems very strange to me that a man of Mr. CAMPBELL'S intelligence and experience should take the ground that "this tendency to late ripening is the result of a weakened constitution, and, most probably, the incipient step toward that degeneracy and decay that has overtaken and destroyed so many of our once popular and valuable varieties." Does he not know that this is "opposed to reasonable analogy, or former experience?" It is well known in this great potato-growing county, where we have had so many once-popular varieties "come and go," that the first step toward degeneracy and decay has always been a premature decay and blight upon the tops, causing a light yield, and soon transmitting the disease to the tuber. A weakened constitution has never caused any variety to sport into a stronger, healthier, and far more productive variety like "Thorburn's Late Rose."

I shall claim, and can prove, that at least three of our standard varieties of potatoes, and quite a number of other vegetables, besides a large number of our most beautiful flowers, are offshoots and sports, and that they are all great improvements upon the original varieties; also, that those who have attempted and succeeded in introducing them to "the public as new and desirable varieties," are, in truth, public benefactors, instead of "impostors."

West Hebron, N. Y. EDWARD L. COY.

FIELD NOTES AND QUERIES.

How to Destroy Nutgrass.—T. W. C., Augusta, Ga., writes:—"Can any of your readers inform me how to banish Nutgrass? I have an orchard full of this pest, and will send any one a splendid recipe for apple pudding, who will tell me how to get rid of it effectually.

Peppermint Culture.—What soil does peppermint require, and what is the best mode of cultivation? What will it yield per acre, cost of machinery for manufacturing, and what price will the oil command? —A SUBSCRIBER.

WHO can answer from experience?

"York Cheat" Corn.—R. J. H., Spencer, Iowa, once had a corn with the above name. He has lost the seed, and asks if any of our readers know it, and where he can get it.

Industrial Societies.

Windsor Co., Vt., Jersey Club.—This Club was organized Feb. 17th, and the following officers elected: *Pres.*—Hon. B. H. STEELE, Hartland. *Vice-Pres.*—O. M. Tinkham, Pomfret. *Sec.*—H. W. Vail, Pomfret. *Treas.*—J. E. Russell, Hartland. *Directors.*—Charles Dana, Woodstock; Obed Whipple, jr., Pomfret; George H. Harvey, Royalton; Ellis S. Wood, Pomfret; C. S. Raymond, Bridgewater. Any breeder of Jersey stock may become a member by the payment of one dollar.

Agricultural Congress at St. Louis.—CHARLES W. GREENE, Secretary, Nashville, Tenn., informs us that the third session of the "Agricultural Congress" will be held at St. Louis, May 27. All agricultural and kindred societies, State, County, or Township, are entitled to a delegate for each fifty of its members, to be duly accredited under seal of their respective societies.

Roanoke, N. Y., Town Ag. Soc.—Officers elect for 1872: *Pres.*—HENRY L. HALLOCK. *Vice-Pres.*—Horace J. Downs. *Rec. Sec.*—Zachariah Hallock. *Cor. Sec.*—Henry W. Young. *Treas.*—Samuel Tuthill. *Directors.*—J. Minor Wells, Robinson D. Terry. The society meets Saturday evenings.

Ag. and Mech'l Ass'n, St. Joseph, Mo.—Officers elect: *Pres.*—DAVIS CARPENTER. *Vice-Prest's*—George Lyon, W. M. Wyeth, Col. I. G. Kappner. *Sec.*—A. C. Dawes. *Treas.*—J. W. Bailey. Fair Sept. 16-21.

The Ohio State Board of Agriculture gives a trial of implements used in cultivating the soil, at Springfield, Clarke Co., O., commencing June 18, provided the citizens furnish grounds suitable for the trial.

Warren, Me., Farmers' Club.—The following are the officers of this new organization: *Pres.*—NATHAN KALLOCK. *Vice-Prest's*—Thos. Webb, Warren Lindley. *Sec.*—Lewis Hall. *Treas.*—J. Y. Cutting.

Gosport, Ind., Dist. Ag. Soc.—Officers elect for 1872: *Pres.*—DAVID GRAY. *Vice-Pres.*—J. R. Fritts. *Sec.*—T. C. Bailey. *Treas.*—J. Wooden. *Sup't*—J. Devore. *Ass't Sup't*—Jas. Secrest.

The Halt Co., Mo., Ag. Soc. will hold its next Fair at Oregon, Mo., Sept. 3-6.

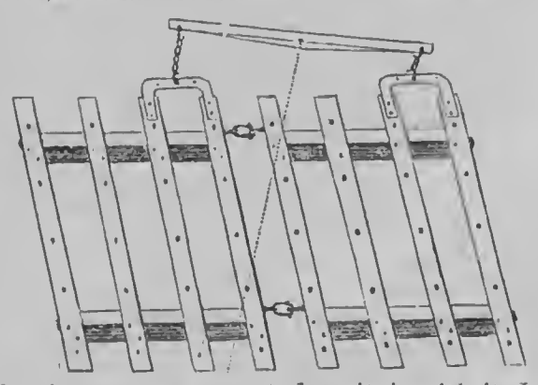
Phelps Co., Mo., Ag. Soc. holds its annual Fair Sept. 17-20.

North Mo. Ag. and Mech. Ass'n holds its Fair Sept. 23-28.

Farm Economy.

A WESTERN NEW YORK HARROW.

SEEING in the RURAL NEW-YORKER of Jan. 27th a cut of a harrow which I think would not stand a theoretical or practical test, as it cannot follow the course indicated



by the evener, connected as it is with it, I herewith inclose a plan for examination which I think will be readily understood. The dotted line, from the middle of the evener back, indicates the line of draft. Fig. 2 shows the coupling of the halves. The eye of the rod, through which the clevis

bolt passes, should fill one and a-quarter inch clevis. The clevis should be three inches in length. Harrows of this description, well made and painted, cost, here, about $16. — R. L. CUSHING, *Niagara Co., N. Y.*

MARKING GROUND FOR CORN.

IN the RURAL NEW-YORKER, March 23d, appears an article from W. H. C., entitled "Making Corn Without Hoeing." I agree with W. H. C. in the manner of preparing the ground for marking; but, from experience and observation, I must beg leave to differ with him in regard to marking. I think that, unless the soil is very poor, that four feet is quite far enough apart for the rows, and 3 feet 10 inches is the most common distance of marking here in Stephenson Co., Ill. As for planting corn in drills so as to admit of plowing but one way, I go against it, every time. I planted a narrow strip to corn, last year, and thought I would only mark one way, to avoid turning so much on short rows; but, notwithstanding the dry season, the weeds would grow. I used a five-tooth cultivator, and double-shovel plow, to cultivate with.

As to his method of marking, it will do well in a dry spring, when it is desirable to mark deep, in order to get the seed into moist earth; but, at any other time, it has two serious objections: *First*, where the marks are made so wide, if the corn is dropped by hand, it is very apt to be dropped on one side of the center of the mark, thus making the rows zig-zag and difficult to work close to. *Second*, the corn being dropped four inches below the surface, does not admit of as early culture as when planted more shallow, as the cultivator throws the soil into the furrow, and is apt to cover the young plant so deep that it will not again make its appearance above ground.

My method of planting and cultivating corn, as near as circumstances will admit, is as follows: If on a heavy clay soil, put on all the manure I can in the fall, whether coarse or fine, and plow under at least eight or ten inches deep; then, in the spring, after sowing, go over it with a two-horse cultivator, and tear up the hard ground, and kill all the weeds that have started; then cross it with the drag, and thoroughly pulverize—the finer the better; then mark both ways, if the ground is not too dry, with a marker, making three rows at a time, about two or three inches wide and deep; drop the corn *exactly* in the check, and cover 1½ inches. As soon as I can see the rows, I start the cultivator, and keep it going as long as the corn will admit. A. L. S.

Winslow, Ill.

ECONOMICAL NOTES.

Three-Horse Evener.—Can some of your readers tell me what length to make a three-horse evener, and what distance to bore the holes apart so that each horse shall do an equal amount of work?—R. HALL.

ONE of the best cheap devices for hitching three horses abreast we have ever seen is this:—Take a piece of two by four or two by five scantling and bore a hole near each end, as for a double tree. The piece need not be over nine to twelve inches long. Then bore a hole one-third the length from one end and two-thirds from the other and attach the piece by a clevis and ring to the plow clevis, the *longest end up*. Then hitch the middle horse to the top and the two outside horses to the bottom or short end of this equalizer, using a double tree for the two outside horses long enough to let the middle horse work well. This is a simple mode and brings the team nearer the plow beam. We are bound to say, however, that it is claimed that there is a patent on this device. If there is we do not know it.

There is no rule as to the length a three-horse evener should be, except that it should be no longer than will permit three horses to work abreast comfortably. The hole in the long arm of the evener should be two-thirds and the short arm one-third the length of the evener.

Alsike Clover for an Orchard.—A. WITMER writes:—"I have a small plot of ground, planted to trees five years ago, which has been cultivated with hoed crops every year since planting. Last fall I sowed it to wheat, it being well-manured clay loam soil. Is it advisable to sow Alsike clover? I have a few bees." In your locality (Niagara Co., N. Y.,) and on your soil, we should think Alsike clover would do very well. If bee pasture is an object to you, and if you think it necessary to seed your young orchard, we should advise Alsike clover. But we would not advise you to take the growth from the soil if you want to derive profit from your trees. Cut it just before the seed is mature, and let it lie on the ground. It will pay.

Farmers' Heating Furnace.—In the RURAL NEW-YORKER of Feb. 17th, JOSEPH ALDEN inquires how much wood the above furnace (described by me, page 35) consumes per month. I cannot give any positive answer, because no account has been kept; but I am satisfied that the amount is less than would be used in a common fire-place, and does not exceed the quantity used in the cook-stove, although three rooms, on the average, are kept at the required heat by it.—N. O. B., *Fairfax C. H., Va.*

The Swine-Herd.

"ARE CHESTER WHITES THOROUGH-BRED?"

MR. BABBITT'S example, in which he had an excess of white pigs in a cross of Chester White and China-Poland, and which he claims, on account of such excess, proves the Chester White to be thorough-bred, would prove, by the same logic, that the China-Poland is not thorough-bred. By the same reasoning, in my case, in a cross of Chester White and Berkshire, where all of the pigs prove to be white, the Chester White must be thorough-bred and the Berkshire not. I do not assert that the Chester White is not thorough-bred (with some breeders I believe it is), but I do assert that the results of the crosses cited do not prove it. Mr. BABBITT'S reference to the fact that Messrs. WOOD, HICKMON, YOUNG and others breed Chester White pigs with lopped ears, only proves that they do, and does not prove that no other family exists, or did exist, as I stated. I suppose the "Magic" hog has been improved since Mr. HARRIS wrote his work, and that he saw at Chicago better specimens than he had seen when "Harris on Pig" was issued. I have seen some very mean "Magic" hogs within a year—unfit to breed from—and I have seen some very neat ones. F. D. CURTIS.

Kirby Homestead.

Swine in the Country.—The monthly Statistical Report of the Department of Agriculture shows that there has been a decrease in the number of swine in the Eastern States. Maryland, Louisiana and California, while the Southern States appear to be giving more attention to the production of pork, and a marked increase of numbers is manifest in the Western States. This increase is thus distributed: Nebraska, 35 per cent; Kansas, 25; Iowa, 16; Missouri, 15; Illinois, 7; Indiana, 6; Kentucky, 6. The value of hogs has decreased. The average value in the pork producing States for 1872, as compared with 1871, is as follows: Kentucky, 1872, $2.55@5.71; 1871, $3.65@8.30. Ohio, 1872, $3.93@9.97; 1871, $6.20@12.97. Michigan, 1872, $3.54@8.06; 1871, $5.39@13.31. Indiana, 1872, $2.98@6.79; 1871, $4.72@10.01. Illinois, 1872, $3.78@7.48; 1871, $5.79@12.71. Wisconsin, 1872, $3.51@7.14; 1871, $6.28@12.91. Minnesota, 1872, $4.04@8.64; 1871, $5.05@11.29. Iowa, 1872, $3.71@7.91; 1871, $5.28@12.79. Missouri, 1872, $2.18@4.78; 1871, $3.37@7.28. Kansas, 1872, $4.27@7.25; 1871, $6.93@14.73. The minimum figures each year are for hogs under, and the maximum for those over, one year old.

The Apiarian.

VALUE OF "FRAME" HIVES.

"DAILY RURAL LIFE" is evidently out of his element when he attempts bee-culture. Were I, who know little or nothing of Floriculture, to undertake the management of a green-house, with all the modern improvements, and fail to make it work to my satisfaction, say that my plants must be too old-fashioned to thrive in this "new-fangled" glass-house, he could, perhaps, understand my reason for saying so; and yet, it would not necessarily be the fault of the green-house that I failed.

It is just as consistent for him, who knows nothing of the management of bees and hives, to lay all the blame, in case of failure, at the door of the "patent bee-hive man," as it would be for a man who knew nothing of the dairy business to buy a lot of patent churns, put the milk in them, and expect them to turn out butter ready for market, without any further care or attention on his part. Does "Daily Rural Life" purchase a tree or plant from a nursery-man, put it into the ground, and expect it to thrive and become "a thing of beauty" without attention? and, in case he is disappointed, does he attach all the blame to the nursery-man?

In order that he will not say that this is from some "patent bee-hive man," I will say that I am not particularly interested, directly or indirectly, in any one movable frame hive more than another; but I am an apiarian, and can number my hives by scores; have also had experience with both the box hive and the movable frame hive. And I can honestly say that without the movable frame hive, bee keeping would never become anything more than a pastime, or the profit therefrom would entirely depend upon "luck."

Now let me give the product of one small district in the State of New York, controlled by one of our intelligent apiarians, who knows how to use the much-abused "frame" hives. The district controlled by his apiary is not, perhaps, twenty-five square miles in extent; that is, his bees in their flight for forage do not cover a greater area than that. It is a district, too, confessedly not the best in the State for the purpose. But look at the figures:—Last year he sold 25,000 pounds of honey at an average of thirty cents per pound, giving him an income of $7,500. He speaks well of the frame hive.

I do not profess to be one of the great lights in bee culture but will, at "Daily Rural Life's" suggestion, go back to ancient times for instructions in making hives; and the first hive on record is "the carcass of a dead lion"—a frame hive—the ribs constituting the original comb guides. I regret, for the sake of accuracy, that I cannot, with any degree of confidence, assert that the bees followed the guides strictly, as they evidently had about the same care and attention as "Daily Rural Life's," and were doubtless "old-fashioned" bees.

Brentwood, Tenn. W. E. LADD.

BEES AND GRAPES.

IN a recent number a correspondent complains of the destruction of his grapes by bees, at which you express surprise, and call for information. For three years past the loss to fruit growers in this section, especially on grapes and peaches, has been serious, and those who do not themselves keep bees are disposed to have some legislation on the subject, though in what shape is not clearly defined. Bees are a kind of stock not readily captured when thus trespassing, and it might prove dangerous sport to attempt it.

My crop of grapes for three years past has been seriously lessened by my bees; but the value of honey they yield, I consider a full equivalent, and acquiesce with as good grace as possible. Early peaches suffer greatly from their ravages, and during last season I frequently observed from ten to fifteen bees at work on one peach, most of them inside the rind, which they had perforated in a bruised or ripe spot. As they work only on the ripest and most luscious specimens, it becomes the more vexatious.

The Catawba and Isabella seem more particularly adapted to this insect's ravages. The Ives Seedling, and Concord from some cause, are not attacked, if the former varieties are found in the same vicinity.

The months of August and September, in which our grapes and peaches ripen, are, in this latitude, very hot, and, as a consequence, "bee pasture" scarce. Fall flowers yield little or no honey, clover and other grasses killed by the heat, leaving fruits as the only resource for their daily supply of food, as at that season they add very little to their store in hive.

The only remedy seems to be to increase the supply of grapes and peaches, so that owners and bees shall have enough for both. Besides, bees are no more destructive to these fruits than wasps, hornets or birds, that make you no return in any shape, whilst bees change your perishable fruits into a delicious article of food fit for princes, and that will remain pure for years.

Let all fruit growers, then, allow these *workers* a pittance of their fruits without grudging, and consider the product of their labor as a fair compensation. Ex——

Galliopolis, O.

BEE NOTES AND QUERIES.

Extracting Honey.—At the Iowa Bee-Keepers' Convention, Mrs TUPPER said:—"I have used the extractor on comb not a week old, and no comb broke down. Do not extract from comb containing brood, believing the brood to be far more valuable than the honey. Took from six hives 420 pounds of honey in a week, and at a favorable time believe this can be repeated every week. Can better afford to sell extracted honey at ten cents per pound than comb honey at 25 cents. Comb is of so high a value that we cannot afford to sell it at an ordinary price. Some have objected to the extracted honey, but as people become acquainted with it they buy it readily. Sells all she has to sell readily, and the demand is increasing."

Entomological.

ENTOMOLOGICAL NOTES.

Lady Birds and Aphides.—I ornamented the soil about my *Brugmansia* with some dry lichens, and in a few days saw a family of "strangers" among my Lady Birds. I fumigated the plant with tobacco, and this settled the doubtful question for the green fly, or Aphis, but seemed to be "mother's milk" to the others, as they increased in size and agility. I captured a few, which I inclose, and would like to know what they are. I fancied they were allies of the Lady Birds, from some observations I made, and have saved a few to watch their habits more closely, while awaiting your reply, which will be life or death to them.—MRS. N. O.

THE strangers found among the Lady Birds are merely the same insect in its larva state. By watching closely, you will soon find them putting on a different coat and becoming Lady Birds. They are fully as beneficial in destroying Aphis while in the larva state as in the imago.

Scale Insects on Plants.—Please give, if you can, the name and how to destroy the insect inclosed. I first found it on my red monthly rose, which I fear it has destroyed entirely. It has also got on my Oleander and Ivy, taking the under side of the leaves of these last; but it is on the branches and stalks of rose.—MRS. L. H. TYRRELL, *Broome Co.*

THE plants are infested with what are called "scale," which is nothing more than a minute species of insect—*Cocci*. Syringe the plants with warm soapsuds—not boiling hot, but warm as you can bear upon your hands. If you can get carbolic soap, use it in preference to the common bar or soft soap; but either will do, if applied thoroughly. It may be necessary to repeat the application two or three times. On Oleanders, and such coarse plants, the insects may be removed by washing the leaves and stems with warm soapsuds, applied with a soft brush.

Apple-Twig Borer.—I wish to know, through the RURAL NEW-YORKER, what it is that is boring the limbs of my apple trees. I set them last spring, and they have made a good growth. Some insect has attacked them and is likely to ruin my orchard. If you know a remedy it would be thankfully received. I send you two of the rascals in a piece of limb.—M. M. NOYES, *Osage Co., Kansas.*

THE insect is the well known Apple-twig Borer (*Bostrichus bicaudatus* of SAY.) It attacks the young twigs just above the buds, boring inward to the pith and thence downward. They evidently bore these holes for food, as we are not aware of any one finding the eggs or larva in the burrows. We do not know of any better remedy than to examine the trees, cutting off all infested twigs, and killing the insects found.

Borers in Pin-Oak.—I herewith send you two borers which I obtained from a small pin-oak, about four inches in diameter. Are they both of the same species, and the common borer that is so destructive to our apple trees?—M. SONGER, *Xenia, Ill.*

THE borers are the larvæ of a much larger beetle than either of the two most commonly found infesting apple trees. As neither of the borers were fully grown, it would be difficult to name them, although both are evidently the same species. There are hundreds of different species of wood-borers. Some infest one species of tree, and some another, while a few attack trees belonging to widely different genera.

Diary of a Ruralist.

DAILY RURAL LIFE.

FROM THE DIARY OF A GENTLEMAN NEAR NEW YORK CITY.

A Late Spring.—*March* 15.—Last year at this time we had our early peas and potatoes planted; but now the ground is covered with snow and frozen nearly two feet deep. This unusual cold weather, at this season, will put everybody behindhand with their spring work, and hurrying times may be expected whenever the warm rains and sun appears. Very little garden or farm work can be done so long as the ground remains frozen, still there is always more or less preparation to be made, such as getting implements in order, making rails, stakes, repairing fences and working over compost heaps, that if done now will save just so much time later in the season.

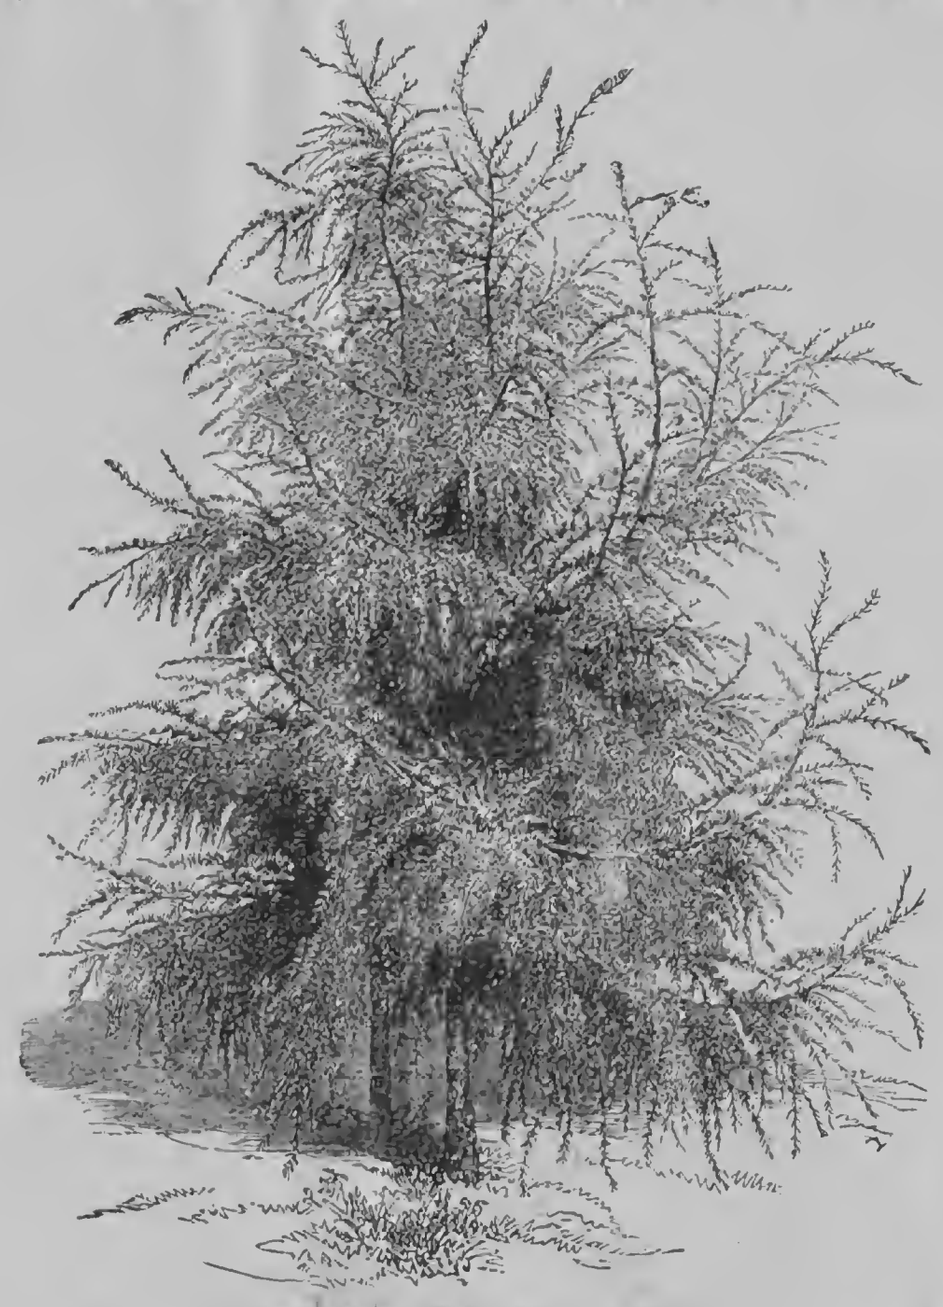
Tender and Hardy Evergreens.—*March* 26.—The past winter will long be remembered for its severity, especially among those who cultivate rare trees and shrubs. I have been looking about among my evergreens, to-day, and many a one heretofore considered perfectly hardy is severely injured or dead. Among arbor-vitæs I found a splendid five-year specimen of ELLWANGER & BARRY'S Tom Thumb, killed, or so near it as not to be worth saving; *Biota ercoides* also dead; Golden arbor-vitæ, *Biota chinensis aurea*, badly scorched; *Thuja minima* killed, and several other of the more rare species either killed or badly injured. In other classes of evergreens, the same destruction is to be seen; *Picea nordmniana* badly scorched; *Cephalotax, us Fortuni*, nearly all the leaves are dead; *Podocarpus Japonica*, dead; *Thuiopsis borealis*, scorched on the South side; *Thuiopsis Dolobrata*, slightly injured; *Abies pumila* slightly injured, and American Hollies where fully exposed to the wind and sun are more or less injured.

The new evergreen, *Vetchia Japonica*, introduced last year by PARSONS & Co., and of which I was fortunate enough to obtain a specimen, has passed through the winter unprotected and uninjured.

The past winter having been exceedingly dry as well as cold, and no snow on the ground to protect the roots of the plants, it must be taken as an exception to the general rule. Of course, it is somewhat discouraging to lose so many choice trees; but such experience brings its own reward, in teaching us to be more careful in giving protection to choice plants. I am convinced that we shall have to practice close planting, and place choice, half-hardy species in groups among the very hardy native kinds, and in this way give protection to those that may occasionally require it. Of course, I am locking the stable after the horse is stolen, but others may take the hint and profit thereby in their planting this spring.

Pruning Hardy Shrubs.—*March 27.*—In pruning the shrubs about my garden to-day, found myself shortening-in the long branches of some kinds, and only thinning those of others. Of course I did not ask myself why these different systems were adopted for different shrubs, because long practice and observation made me prune in this manner without any special thought in regard to the operation. But I can readily understand how the novice in such matters could make great mistakes. For instance, if he should shorten all the leading shoots of his lilacs, they would not bloom, because the flower buds are borne only on the ends of branches, and the same is true with Magnolias and a few other shrubs and trees. The *Weigelas* produce their best flowers on shoots of one year olds and if these are shortened, the portion remaining will bloom just as freely, or even more abundantly than if none had been removed. Where these shrubs are grown in large clumps the old canes which have bloomed for one or two seasons should be removed entire and the young shoots allowed to fill up the space. *Deutzias*, Flowering Almonds, *Spiræas*, and many other shrubs which produce their flowers on small side or lateral shoots may be pruned in the same manner. The best time to do this pruning is just after they bloom in summer, then the entire strength of the roots goes to produce canes for next season. The Althea, or Rose of Sharon, produces its flowers on the new wood, consequently the more severely the plants are pruned in spring the more new growth and flowers the following autumn. Lilacs may be pruned as soon as they cease flowering in the spring, and if it is necessary to shorten the branches it should be done at this time in order to allow new ones to be produced with their terminal flower buds before the ensuing year.

All these variations in the form of growth and mode of flowering seem to be a very simple matter to those who know them, but as one passes through the country and sees the neglected gardens and orchards, or the results of injudicious pruning, he is compelled to believe that there is need of even the simplest instruction in regard to pruning shrubs and trees. Observations in regard to the habits of trees and shrubs should be a sufficient guide to the best time and method of pruning.



EUROPEAN WEEPING LARCH.

Arboricultural.

WEEPING LARCH.

WE present herewith an illustration of the European Weeping Larch, (*Larix Europæ pendula.*) It is sometimes called the Tyrolese Larch, but it is only a variety of the common European species, a most beautiful and useful tree, and well adapted to our climate, thriving in a great variety of soils. Both the weeping and upright varieties of the Larch are trees suitable to plant near dwellings, inasmuch as their leaves are deciduous and drop off in autumn, allowing the warm sun of winter to enter the house at a time when needed; and in summer it is shut out, thereby giving a cool and acceptable shade.

The larches possess the fine beautiful foliage of the most desirable evergreens, and we know of no more graceful tree than this weeping variety. On account of the dense shade of large evergreens in winter as well as summer, they should never be planted close to the dwelling house; but all deciduous trees may be placed in this position, and the Larch among them. We presume almost any of our nurserymen can supply customers with the Weeping Larch.

GROWING NUT TREES.

A SUBSCRIBER asks in the RURAL NEW-YORKER of March 2, page 148, how to grow Chestnut, Hickory and Walnut trees from seed. Tell him to follow the course of nature. I have planted Black Walnuts and Butternuts by the hundred. Plant in the fall, soon after they are gathered, when the shuck is green; never allow hard shell nuts to dry. My practice has been to plant quite thick in rows, six or eight to the foot, about four inches deep. At two years old, when about three feet high, I transplant to give them more room. The tap root of the Walnut is as long as the top, and twice as large round. I dig a trench beside the row eighteen to twenty inches deep, and carefully take them up; cut off the tap root about eighteen inches below the surface, and set them in a convenient place in rows three or four feet apart; leave them to grow six to eight feet high. Then dig them up carefully, early in the spring, when the dirt is adhesive, leaving as much as possible on the roots; move carefully to the place desired; have holes dug large, to receive the roots as they grew before; fill the hole with rich, mellow earth. The owner, with his own hands should place the dirt carefully under and round every root; pack firm until all the roots are covered; then spread over the surface about four inches of loose, mellow earth. I will warrant them to grow; have never lost one.

I have Black Walnut trees, raised from seed, about twenty years old, from ten to fourteen inches in diamer, a foot above the ground; have gathered two bushels of nuts (with the shucks on) from a tree. I have several bearing Butternuts. I now regret that I had not raised ten times as many. They make a beautiful shade tree, and in time the timber will be valuable.

I once planted in the fall a few Butternuts taken from the chamber dry, late in the spring two only came up; in June I dug up one of the nuts and cracked it; the meat was as sound and as good to eat as those kept in the chamber. I am too far North for Chestnuts, and my woods abound with the common Walnut. H. C.

Paris, Canada.

ARBORICULTURAL NOTES.

Coal Ashes About Fruit Trees.—Are coal ashes beneficial to fruit trees? If so, how shall I apply them?—SUBSCRIBER.

COAL ashes are only beneficial to trees when applied as a mulch where the trees stand in grass. At least we have never found them useful in any other way, when applied alone. They keep the grass down, if applied in sufficient quantity, and the soil loose. But they are excellent to mix with any kind of fermenting manure. They are very good deodorizers, or absorbents, and can be used with the most profit in this manner.

Cuttings by Mail.—Will you please inform me how to send cuttings, such as grape, etc., by mail, so as to have them go safely, and at the regular rate of postage for cuttings? I don't remember to have seen any directions in the RURAL NEW-YORKER for it.—H., *Alco N. J.*

MAKE the cuttings of the required length, say from six to twelve inches, and tie them in bundles which shall not weigh over four pounds when packed. Roll the cuttings in damp moss, covering all except one end; then wrap in oiled paper, to prevent the moisture injuring other mail matter with which the package may come in contact. Over the oil-paper put another envelope of thick wrapping-paper, upon which the address of the party for whom it is intended may be written. One end of the package must be left open, in order to allow the post-master to examine the contents, if he should wish to do so. No writing of any kind should be enclosed in the package, except a label giving name of the cuttings.

Trees in the Shade of Pines.—What kind of forest trees will grow in a grove of old pine trees? I have a grove of pines and elms, planted sixty years ago, and the under branches having died out, leave too much open space. Maple, Ash, and Chestnut trees live under the shade but a few years. Will any trees live? What is understood by the coniferæ tribe of trees?—A READER, *N. Y. City.*

WE do not know of any forest tree that will succeed well under the shade of pines. But there are many shrubs that might be planted around the borders of the grove, and, perhaps, some species may succeed in among the trees. Hollies, Kalmias, and some of the native Rhododendrons, are beautiful, broad-leaved, evergreen shrubs, that succeed pretty well in the shade, and you can scarcely do better than to try them in the situation described. The word coniferæ simply means "cone-bearing." The most common examples are the Pines, Spruces, and Larch.

Floricultural.

FLORICULTURAL NOTES.

About Lilies.—Where can St. Bruno's lilies be had? I do not see them in either of five catalogues received this spring. Also, please tell me if "Florida Lilies" (*Crinum Americanum*) are hardy and may be left in the ground? I had formerly a lily growing about one and a-half or two feet high, dark green leaves, whorled, *very* bright, orange-colored, erect flowers, blooming in June; but having lost it, I have never been able to replace it, as I did not know the name. Can any one inform me? I have a passion for lilies, but they do not do well in my soil, a light sand, and should like advice.—F. A. A.

WE do not know why our florists neglect to advertise the St. Bruno's Lily, (*Antheri-cum liliastrum*, unless it be that they have none for sale. If they are so very scarce, some one should import a quantity and grow a stock of this fine old plant. Had you given us your address in full, we might have induced some friend to send you a plant. The "Florida Lily" (*Crinum Americanum*) is not hardy in the open ground anywhere in the Middle or Northern States.

The bright orange-flowered lily, to which you refer, is probably *Lilium umbellatum*. Light sandy soils are sometimes too hot for lilies in summer, causing them to rust and decay; the best preventive is to cover the surface of the soil about the plants with some kind of mulch and then give plenty of water.

Grafting the Coleus.—It may seem to be entirely superflous to suggest an improvement upon the many beautiful varieties of Coleus now in cultivation. But it should be the aim and pride of every florist to make some change or add another shade of color or form to every plant under his charge; and now that the newer Coleuses are really almost, or quite, perfect in both form and color of leaf, he must try his skill in another direction and graft the various varieties upon one stock. Take for instance a strong plant of *C-verschaffelti*, and graft a light golden-leaved variety upon the first tier of branches; upon the next, one of a darker shade, and so on to the lower, which may be the deepest colored of all. Then reverse this order in color upon another plant, or put a different variety upon each branch. Magnificent specimen plants can be made in this way, and such novelties are always attractive and highly appreciated. We throw out these hints hoping that at our Fairs next fall we shall see many such specimens.

Double Geraniums.—My success with Double Geraniums has been good, with but one exception, and that was with the *Mad Rose Charmeu.r.* It is strong growing and hardy; the trusses are produced freely and well above the foliage. There are many pips in a truss—often 50 to 60; but the great difficulty is that they do not open out full; they always have the appearance of being wilted. I have tried almost every way to induce it to bloom; I have pruned close and *vice versa*; also in warm situation and cold, and used all kinds, of manure but without effect in regard to blooming. Has any of the RURAL readers had such failures.—M. A.

Conoclinium.—H. R., Fairfield, N. Y., asks the name of a plant which he inclosed. It is probably *Conoclinium cœlestinum;* but we would not like to decide positively from so poor a specimen.

Domestic Economy.

PREPARING CRACKED WHEAT.

NOTICING an inquiry in the RURAL NEW-YORKER a few weeks since, in reference to the preparation of cracked wheat, I will give you my method, which has given my own family, and those eating at my table, entire satisfaction, and, I might add, gratification too. Wash plump kernels of white wheat, (if possible to procure it), thoroughly; dry the same in the oven of your cooking stove so as to heat the wheat without parching it. Here lies the great secret of having a good article of cracked wheat. If the wheat has been well heated and thoroughly dried, you have but little trouble to grind it in an ordinary coffee mill. If it has been heated properly, the mill will cut and crack the kernels without mashing them or flattening them out.

After grinding your wheat, either fine or coarse, as you may prefer, it is ready for cracking. If possible procure a vessel to boil it in that will fit inside an iron pot, on the principle of a glue kettle. This will prevent burning. Fill the outside vessel with boiling water; set your vessel with the water to receive the cracked wheat, inside, and stir in moderately thin; stirring at first to keep out lumps; cook at least one hour, two is better. A very little experience will determine the proper consistency, and a most delightful and healthy dish will reward you for your trouble. Serve with milk, cream, sugar or sirup, as your taste may dictate. H.

Atlanta, Ga.

ODDS AND ENDS.

Graham Bread.—If W. L. B., will try my recipe for making Graham bread, she need look no further. After trying various rules I find none so good as my "Eureka," as I term it. Take two cups buttermilk; one half cup best sugar-house syrup; one teaspoonful soda; half teaspoonful salt. Stir with a spoon to a stiff mass (not too stiff, else the bread will be too hard), pour into a three pint basin well buttered; put it in a steamer over cold water, which gives the loaf more time for rising. Steam three-quarters of an hour; then place it in the oven just long enough to give it a rich, brown color. If the buttermilk is not of sufficient richness, I use a tablespoonful of thick cream. Graham bread raised with yeast is much improved by cooking the same way.—S. J. D., *Painesville, O.*

Apple Charlotte.—Pare and slice your apples; put a half pound of white sugar to every pound of apples, and as much water as will be sufficient to stew. If the apples are very acid, add a little more sugar; flavor with lime sirup; butter a dish, and line it with buttered bread; then put a layer of apples, and one of buttered bread, and so on, until the dish is filled. The last layer should be apples. Take the crust off the bread. It should be baked in a slow oven.

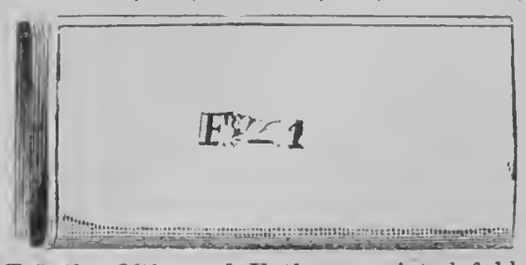
Recipe for Cocoanut Pudding.—I send one which is excellent:—Two small cocoanuts, grated; one quart new milk; four eggs; four ounces butter; six ounces sugar, or more if desired. Beat the sugar and butter together; put in a dish and bake. Stir the pudding until it becomes scalding hot, to mix the cocoanut and custard together, then let it brown.—J. B. G., *Hickory Run, Pa.*

Cocoanut Pudding.—Mix a grated cocoanut with half pound powdered white sugar; add quarter pound melted butter; beat up six eggs, leaving out half the whites; then one grated nutmeg. Let all be well mixed. The dish to be lined with pie-crust of the following proportions: One pound of flour, three-quarters of a pound of butter, and a half pint of milk, or water.

Macaroons.—Blanch three-quarters of a pound of sweet almonds, and the same of bitter almonds; beat them very fine; then add one pound and a half of white sugar, the whites of six eggs, beaten to a froth; mix all well together, and drop on paper, and bake in a slow oven. Of course the paper is to be on tin sheets.—OLNEY HARLESTON.

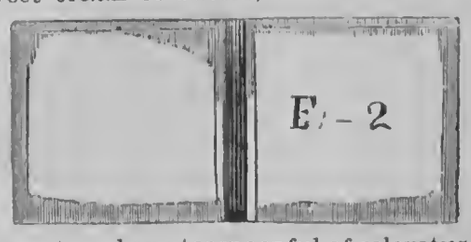
Trifle.—Mix one pint of thick cream, half pint of milk, three gills of wine—Madeira or Sherry—six ounces of white sugar; then slice sponge cake and place in the bottom of the dish; moisten it thoroughly with wine or ratafia; then pour a part of the mixture over the cake, and whip up the rest to a stiff froth, and put on the top.

Folding Napkins Tulip Shape.—We give the last of our series illustrating how napkins are folded: F 1, first fold; F 2, the second; F 3, the third; F 4, the fourth;



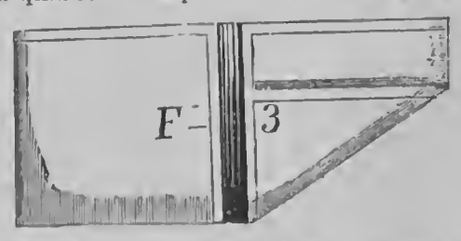
F 5, the fifth; and F the completed fold, Tulip shape.

Good Biscuits.—One teaspoonful saleratus to each cup of cream; a little salt. Mix quick and bake quick. For light biscuit, use one quart of sponge, one cup thick sweet cream or butter, to shorten it that



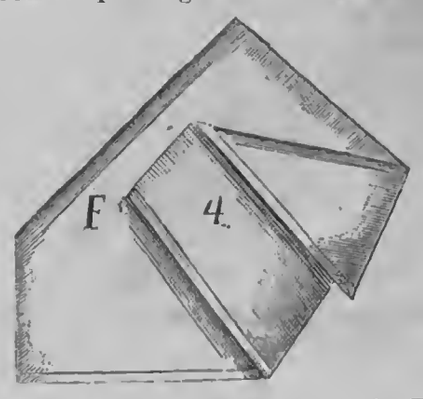
amount, and one teaspoonful of saleratus.—L. E. K.

Rice Pudding.—Scald a quart of milk, with four spoonfuls of soft-boiled rice, and a few sticks of cinnamon; after which, stir in a quarter of a pound of butter and six



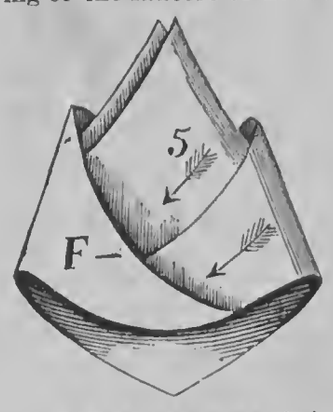
ounces of white sugar; eight eggs, beat up light, and added when the mixture is cool. To be baked in a deep dish. If you overbake, it will run to whey.

Frost Cake.—Will some of your numerous readers please give their best mode of

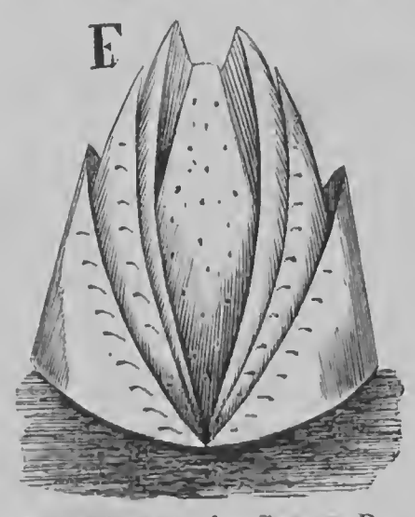


frosting cake—amount used, etc.?—T. P., *Ithaca, N. Y.*

Domestic Inquiries.—Can some of your correspondents inform me how to remove from Brussels carpets stains caused by the overflowing of the saucers of house plants?



—J. Q. . . . . How shall I make brine—proportion of salt to water—for pickling cucumbers.—L. W. . . . . What is the cheapest and easiest method of making hard water soft, for washing clothes?—R. P. S. . . . . Who will tell me the best method of cooking Salsify, or Vegetable Oyster, so as to simu-



late the real oyster?—SARAH P. . . . . Is there any preparation for cleaning painted work, that housewives know will not injure the luster thereof? My sitting-room is painted with zinc paint and has a luster. I do not want to use anything that will destroy it.—MRS. F. W. S.

Rural Architecture.

SOUND-PROOF FLOORS AND PARTITIONS.

HAVING occasion to put up a sound-proof or deafened partition, when a foundation

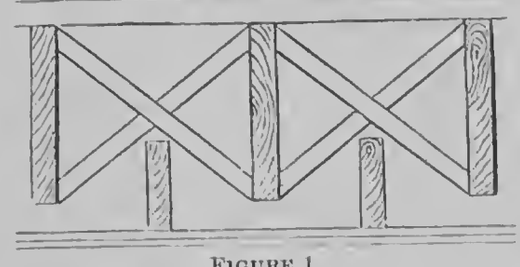


FIGURE 1.

for a brick wall would have been in the way, I adopted the plan shown in Fig. 1, which proved successful. It will be seen that it consisted simply of a double set of studding, one set placed so as to receive the lathing from one side—and the other set between and about one inch further out so as to receive the lath from the other side, making the wall of one room entirely independent of the other. The additional cost was not more than the cost of the extra studs, as the work in setting the two set was not greater than trimming up the single set. Imperfect studs do as well as perfect ones.

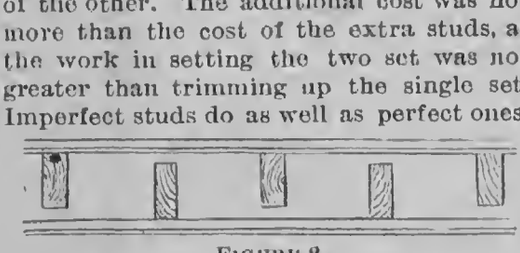

FIGURE 2.

Fig. 2 shows the same idea applied to floors; and this is a cheaper and better method than either of the usual methods of deafening floors. It makes the ceiling wholly independent of the floor above, and the plastering is not cracked by the spring of the joists. J. E. S.

Syracuse, N. Y., March 20, 1872.

PRAIRIE HOMES.

MR. HOWELL'S plan (see RURAL NEW-YORKER, March 23, page 193,) of how to begin and finish a prairie home is worthy of attention and imitation, so far as it suggests economy and convenience, adapting itself to the needs of the immigrant with a small family and means. I recommend it to their notice, and would like to suggest some corrections. First, instead of seven feet between floors, eight feet is as low as a living room should be. Second, the walls of a room, where windows are inserted, should not be less than two and one-half inches instead of one inch; in the latter case they would be worthless. Third, there should be material enough to cover it—800 feet besides the timber is not one-half enough, and here comes the disappointment. After the frame is ready, it will require of 1½-inch plank to inclose the building, 800 feet; of inch boards to line it, 450 feet; of 1¼ stuff for lower floor, 240 feet; roofing boards, 240 feet; for upper floor, 160 feet; for veranda, 250 feet. Total, 2,140 feet, instead of 800 feet.—WM. BARRON.

NOTES FOR BUILDERS.

Wants a House Divided.—A house 30 by 40 feet, with L attached, 20 by 30 feet, forming a half square, making two fronts, standing on southeast corners. Good fencing on north and west. Will some of your subscribers inform me how best to divide it off into rooms convenient for a family of eight or ten persons—making the kitchen, pantry and bath-room in L part; sitting-room, parlor, library, bed-room, closets, etc., on the first floor in upright part. I have built several dwellings for myself and was never fully satisfied with the arrangement thereof—hence the question.—A SUBSCRIBER.

The Gardener.

GROWING PEAS.

HAVING had some experience in growing peas, among the Jersey truckmen, near Philadelphia, I herewith give their method of procedure. For an early crop, the ground is plowed just as soon as the frost is sufficiently out to get a plow in the ground; then marked out, four feet apart, with a one-horse plow, about seven inches deep; next, fine manure is scattered along the bottom of the furrows, from the tail of a cart, taking three rows at a time. After this is done, the seed is scattered on the manure, and covered by horse and plow, the plow being partially turned over on the moldboard side. A practiced hand will do this nicely.

The cultivator is kept running between the rows often enough to keep the weeds in subjection. Sometimes furrows are plowed on either side of the rows, as wind-breakers for the plants, and then cultivated down again after a few days. The last cultivation they receive is to plow a furrow on either side, directly against the rows, to keep them from falling down.

Several varieties of early peas are grown there. The early Hancock took the lead among the Burlington Co. truckers, while we resided among them.

Late peas are grown in the same way, the Blackeyed Marrowfat (Canada Seed) being the variety grown. This variety usually pays much better than early ones. The early crop comes into picking along with strawberries, and it is a difficult matter to get pickers to pick peas when they can get berries to pick. * *

Ransom, Pa.

GARDENERS' NOTES.

Dividing Asparagus Roots.—I wish to inquire if asparagus roots can be propagated by division of the roots; if so, at what time should it be done?—J. P. P., *Cold Water, Mich.*

IT is possible to divide old asparagus stools and make each division produce new shoots; but it is not advisable to do so, because seedling plants are preferable. Early spring is the best time to divide old plants, if it is done at all.

Trophy Tomatoes.—Last season I raised magnificent tomatoes of this variety from seed obtained of BRIGGS BROS. I have never had finer fruit from any species, though I think my Tildens were quite equal to them. Neither kind rot in this latitude, with ordinary advantages.—MRS. BOWEN, *Sycamore Dale, West Va.*

Hen Manure for the Garden.—A correspondent asks the best mode of using hen manure on a garden. The best mode we have ever adopted in applying it is to put it in barrels, add water, leaching it, and applying it to plants in liquid form.

Sage Culture.—C. E. C., Winnebago Co., Wis., asks some of our readers who have experience to state what kind of soil is best for sage culture, and what is the average price per pound realized in its production.

Mushroom Spawn.—T. H. YOUNGMAN is informed that good spawn may be obtained of almost any first-class seedsman advertising in our columns.

The Sportsman.

NOTES FOR SPORTSMEN.

Inquiry About Rifles.—I would like to have some of the readers of the RURAL inform me as to the best kind of a rifle for target and sporting purposes. Is a muzzle-loader, without a false muzzle and starter, superior to a breach-loader in point of accuracy? Can any one inform me about the performance of the Maynard rifle? Is it more accurate than F. WESSON'S metallic cartridge? Does it (the Maynard) ever get worn in the working parts so as to allow the barrel to wobble and get out of line with the stock? A little variation will make quite a difference in the shooting at long range, when the rear sight is attached to the stock, and the sights cannot be trued unless the barrel is secured firmly to the stock when ready to fire.—F. A. C.

To Make a Partridge Trap.—Make a box three feet long and a foot and a half in hight. Make the sides of lath. Make a door on top two and a-half feet in length, and suspend or hang it by a wire through the center of the door. Then put grain on the top of the trap and door so that the game must alight there to get it. When the partridge steps on the door it turns so suddenly that the bird is not able to escape. Try it.—J. N. B., *Champaign, Ill.*

To Tell Good Powder.—Place on a sheet of clean writing-paper, about three or four inches apart, two small heaps of powder, and upon firing one with a heated wire, if it explodes with a good report, and if no sparks fly off to ignite heap No. 2, and if no specks are left on the paper, it may be considered as good powder. But if this fails, the ingredients are impure, or they have been mixed in the wrong proportions.—HUNTER.

To Catch Brook Trout and "Horned Dace."—CHARLIE, a lad ten years old, asks sportsmen to tell him what tackle to use, and how to fish for brook trout and "horned dace."

Dairy Husbandry.

CHEESE FACTORY NOTES.

A JOINT stock company for the manufacture of cheese has just been formed in the North Riding of the County of Oxford. They purpose building a curing house 100 by 42 feet, three stories high; concrete floor in the lower flat; the lower story also to be stone. The Directors would be much obliged if you would answer the following questions:

The best method of ventilating this building, especially the lower story. Would openings at the side of the building be sufficient, or would it be necessary to conduct the air in pipes nearer the center?

The size and form of windows, and how opened?

The best method of raising the cheese to the second and third floors with engine?

Would you recommend feeding hogs or making whey butter?—F. MALCOLM, *Innerkip P. O., Ont.*

I. The proper ventilation of cheese curing rooms is very imperfectly understood, or at least very poorly carried out in practice among the cheese factories. We have seen good results from the use of openings even with the floor, provided with wickets, so as to regulate draft or to close entirely, as desired. Ventilators should run from each story directly to the roof of the building and above it. They may be made so as to operate in common for each story. The usual plan of allowing the emanations and foul air of the lower room to be conducted into the room above, there to saturate the cheese with its bad odors, is a most pernicious system, and is often the cause of great mischief. We cannot give specific directions in regard to the construction of ventilators, but it will be sufficient, perhaps, to state general principles. By using ventilators near the floor opening out the side of the building and provided with wickets pure air is obtained, and the draft may be regulated as desired without danger of striking directly on the cheese. Then by having provision in each room for carrying the foul air directly out of the building the cheese is kept free from taints arising from the fermentation or decomposition of the cheese in each room.

The openings for ventilation should always be provided with wickets, so as to be easily adjusted to regulate the draught.

II. The best method of raising cheese to the different stories, by means of an engine, is to employ elevators similar to those used in hotels and stores. If our correspondent will examine the elevators at one of the new wholesale stores in Toronto, within a block or two of the railroad depot, he will get a better idea as to the method of constructing these appliances than we can give in writing.

III. The butter may be taken from the whey, and the whey then will be nearly if not quite as good for the hogs as under the usual practice of feeding whey from cheese factories where no butter is made. At some of the factories, a very good thing has been done in making whey butter. The butter, however, should go into immediate consumption. Wheat bran, or shorts, mingled with the whey, is a good feed for hogs. Whey should never be made the sole feed for swine. It does not contain the elements of nutrition in the right proportion as a sole feed for this class of animals.

MAKING AND PACKING BUTTER.

MUCH has been said in your columns on the subject of making and packing butter. As every one has a different theory, I will give my own practice, which has proved very satisfactory, and may be of advantage to others. To have good butter, three things are essential: 1st. Good milk. To have this a good cow is requisite; a poor cow will barely pay for keeping. All clear profit is made from good cows. But even a good cow will not give good milk unless she has proper food. Bran, shipstuffs, clover hay and vegetables—carrots, turnips, small potatoes, etc.—with slops from the kitchen, have always given me the best results.

2d. Proper vessels for holding the milk. These may be tin pans or shallow crocks. If the former, they should be thoroughly cleansed with brush and soap, then scalded with clean water, aired and dried. If earthenware is used, it should go through the same process of cleansing and then be put into the stove, or other warm oven, and well baked. This will keep them entirely sweet.

3d. The cream must have the same careful handling as the milk. In the summer it should be kept in a cool place in a large vessel—stone jar—till thick enough, not till it becomes acid to the taste. In winter it will require to stand in the churn by the stove for several hours. When ready it should be churned very rapidly, and as little water as possible used with it. I use no water on butter after it comes from the churn. Thorough working with the hand or wooden ladle is my plan for taking the milk out of it.

The best seasons for packing butter are May and October; the former for summer and the latter for winter use. When taken from the churn I work out all the milk I can, salt more than for present use, and set it in a cool place for ten or twelve hours. I then give it another thorough working, by which it is entirely freed from milk. I then pack it down, perfectly tight, in a new earthen or stone vessel, and cover it with a cloth, on which I put an inch of fine salt to exclude the air. When the vessel is full it is closely tied with paper, the cloth and salt still remaining. By keeping in a dry, cool place, butter made and packed in this way will remain perfectly firm and sweet for many months. SARAH H. PORCH.

Kirkwood, Mo.

DAIRY NOTES.

Transactions of the Vermont Dairymen's Association.—Secretary BLISS of the Vermont Dairymen's Association has sent out a very neat pamphlet of 172 pages, containing much valuable information. It gives the address and proceedings of the annual meeting at Montpelier in 1870 and of the winter meeting January 18, 19 and 20, 1871. We have no space for a summary of the papers and discussions, but the following will give the reader some idea of the contents of the volume:—Annual Address at Montpelier, by X. A. WILLARD of Herkimer, N. Y.; Address at the winter meeting, by President ANGELL of Vermont University; Paper on Butter Making, by F. D. DOUGLASS of Whiting; Improvement of Pastures, by Z. E. JAMESON of Irasburgh; Management of a Good Butter Dairy, by the Secretary, O. S. BLISS of Georgia, Vt.; The Needs of the Dairy, by T. D. CURTIS of the Utica Herald; Cheese Making, by HARRIS LEWIS of Frankfort; The Chemical Composition of Milk, by Prof. COLLIER of Vermont University; Address by Governor STEWART of Vermont; Natural History of Cattle, by Prof. GEO. H. PERKINS of Vermont University; Summer and Winter Management of Cows, by E. R. TOWLE of Franklin. Mr. BLISS appears to have reported the discussions very clearly, while the arrangement of papers and the editing of the work has been ably performed. The Report will compare favorably, whether in contents or the attractive form in which it is issued, with any Reports of similar organizations.

The Management of Dairy Cows.—I am of the opinion that there is no subject of more immediate interest to the dairying community, and about which so little that is of *real practical* worth is said, than the care and management of dairy cows. To be sure, we have many valuable essays from learned men, all of whom urge the necessity of giving cows proper care and good treatment.

We frequently see articles written by men who practice steaming their feed, and who advocate the same; but few of these ever give us the relative value of cooked feed over uncooked. The same is true of very many who give us plans of barns, etc. These sketches are of some benefit to architects, but, not furnishing the cost of labor, material, etc., they fail to be of much benefit to those for whom they are given.

We want *facts* and figures from men who have had practical experience. Will not some of the many veteran dairymen in the State, tell us how much grain and what kinds, it will pay to feed cows? In this section very little grain is raised; we can buy it at the depot within a few miles for the following prices: Corn Meal, $1.75 per hundred; Wheat middlings, $1.75 per hundred. How much can I make it pay to feed, with butter at 30 cents? Also, how many pounds of hay equal in value one of corn meal?

J. D. SMITH.

Prepared Annatto.—We would like to know whether it is considered safe to keep prepared annatto in tin cans, or not. I have often noticed that English annatto came in stone jugs, but would like to know if it may not be put in tin packages with perfect safety.—HENRY H. ROE.

WE should not deem it advisable to put up prepared annatto in tin cans. Most of the prepared annatto is cut with potash and other alkali, and these will soon act upon the cans, causing them to leak. Then, the decomposition of metal would be likely to have more or less influence upon the healthfulness of the annatto, even if it did not affect the color. Dairymen and others who have occasion to use annatto as a coloring for human food, cannot be too careful in selecting a pure article in the first instance, and then take all proper means to keep it free from all deleterious influences. We should say, put up the prepared annatto in stone jugs, on the English system. It is the best, and, in the end, will prove the cheapest.

The Naturalist.

CALIFORNIA QUAIL.

IN the RURAL NEW-YORKER, February 10th, we gave an illustration of, and article upon, the California Quail. Soon after, we received the following communication from a Naturalist, whose name will at once be recognized as an authority in his specialty, which has been necessarily and unwillingly (on our part) deferred. It will be read with interest:

DEAR RURAL:—Allow me to give to your readers more definite and some further information in regard to the California Quail illustrated in the RURAL of Feb. 10, under the heading of "Sportsmen's Notes: First, and above all, the name—*Lophortyx Californica Bonaparte* (California Quail). This species must not be confounded with *Lophortyx Gambelli Nuttal* (Gambel's Partridge), found in the southern part of California, on the Colorado River, while the former inhabits the coast as far north as Vancouver's Island. They are very much alike, and not easily distinguished from each other, unless carefully compared. But neither of these species can possibly be confounded, as you state, with *Ortyx Virginianus, Bowp.*, for the former genera *Lophortyx* is distinguished from *Ortyx* by the tuft of feathers on the head, making a very marked difference between them. You give the scientific name of the common quail "*Coturnix vulgaris*;" this is a synonym of *Coturnix Major*, BRISS—the true quail of England. We have no quails in the United States. You have also given a description of this British bird, *Ortyx Virginianus*—evidently a mistake—true common name, "Bob White;" called at the South, Virginia Partridge; at the North, Quail; is found from Texas to Labrador.

There is another species of this genus found in Western Texas (*Ortyx Texanus*, LAWRENCE), which is quite similar, and not distinguishable from the former, except by careful comparison. The four species mentioned are all we have of these two genera in this country.

I also wish to write a few words on local names, as the subject now before us fully illustrates the importance of scientific ones being used by all who wish definite information on subjects of Natural History. The so-called Virginia Partridge is not a partridge; for we have no species of this genus (*Perdix*) in America. In New England, it is called Quail; this name is equally wrong, as we have no quails (*Coturnix*) here. The partridge of the North (*Bonasa umbellus*, STEPH.)—true common name, Ruffed Grouse—is called Pheasant at the South. The Robin Redbreast of England is not the American Robin, *Turdus migratorius*, LINN. *Ampelis Carolinensis* (BRISS) is the Cedar bird of Massachusetts, Cherry bird of Central Vermont, and Canada robin of Canada. Thus, instances of this false naming may be brought up without end; but *Lophortyx Californica* means the same bird, the world over.

Boston, Mass. PHILIP S. SPRAGUE.

A CARD FROM DR. MICHENER.

WHAT does my good friend STAUFFER mean? In the RURAL of Dec. 23d, 1871, when endeavoring to identify F. F. BROOKES' bird, as the *Guiraca ludoviciana*, or Rose-breasted Grosbeak, he refers to, and quotes from, my note book, implying the identity of my bird with that of friend BROOKES'. But it implies more—that the intelligent gentleman therein named and myself, not knowing the Rose-breasted Grosbeak, had committed the grave blunder of calling it a *nondescript*, and describing it under a new name, *Emberiza albigula*, or White-throated bunting. A grave blunder, indeed! for the two birds are no more alike in size, or markings, than a Canada Goose and a Muscovy Duck.

It is the more remarkable that my friend should have made such a mistake, when he must have had reference to Prof. BAIRD'S "Birds" in Explorations and Surveys for a railroad route to the Pacific, Vol. IX, p. 495, the only place where my *Memorandum* has appeared, and in connection with my note, the professor remarks:—"This curious bird has long been a puzzle to ornithologists, in the uncertainty whether it is only a variety of the *Euspiza Americana*, or a distinct species. Thus far but one specimen is known, the one before me kindly lent to the Smithsonian Institution by Dr. MICHENER."

When the bird was shown to the late J. J. AUDUBON he immediately pronounced it new, and has described and figured as such—*Emberiza Townsendii*—TOWNSEND'S bunting, in both his larger and smaller "Birds of America." The synonymy now stands:

Emberiza Townsendii, AUD., Orn. Biog., II, 183, plate 409. (1834;) do. Birds of America, III, 62, pl. 157, (1841.) NUTT. Man. I, 528, 2d edition, (1846.)

Euspiza Townsendii, BON. List. (——;) BAIRD, R. R. Rep. Vol. IX, 495, (1853-6.)

E. MICHENER, M. D.

New Garden, 21st of 12th mo., 1871.

NOTES FOR NATURALISTS.

Canary Birds.—In answer to an inquiry in the RURAL NEW-YORKER in regard to raising Canary birds, I would say, for one thing, that they should have no water to wash in while sitting, because they will go from the water to their nests, with their feathers wet, and the eggs will be chilled, and consequently will not hatch.—J. A. R., *Pittsburg, Pa.*

Exchanging Birds' Eggs.—THOMAS C. COOPER, Santa Cruz, Cal., is making a collection of birds' eggs—has fifty different varieties, and would like to exchange with any of the RURAL'S readers.

Scientific and Useful.

USEFUL AND SCIENTIFIC NOTES.

Raising Water with a Syphon.—I have been drawing water for the last ten years from a well to my barn-yard, on the syphon principle. The well is fifty rods distant from the yard, with a fall of 25 feet. The water at the well had to be raised five feet perpendicular, and has always run without trouble until last fall, when the water failed and we dug the well deeper, so that the water has to be raised at the well now fifteen feet. Thus the surface of the water at the well is ten feet higher than the surface of the ground at the barn-yard. Is there any reason why the water should not run if the pipe is properly filled? What is the best means to be employed in starting the water? I have tried to start it by attaching a common cistern pump to the end of the pipe at the yard, but failed; also, by pouring water in the pipe at the well, but it would run but a few minutes. I should have stated that I could start the water with a cistern pump when I had to raise it but five feet at the well. Any information in regard to the above would be thankfully received by—AN OLD SUBSCRIBER.

Minerals for a Name.—I send you some specimens that I dug out of a ravine, and can find no one here that can name them. I would like to know whether or not it is some kind of superphosphate, and, perhaps, good as a fertilizer for corn or wheat. It was under a layer of limestone, and is about three feet thick. A part of the substance will stick, if touched to the tongue, and is quite a curiosity about here. If it is of any value, please inform me, and oblige—WM. N. IRWIN, *South Salem, Ohio.*

THE mineral is common "Serpentine," and of no particular value, being partially decomposed or rotten. Serpentine, when it occurs in masses, is used for ornamental work, the same as other handsome kinds of stone. The usual colors of serpentine are gray, green, yellow, red, bluish, or brown. The specimens sent us are green and yellowish-white; the latter is partially decomposed, and somewhat of the nature of meerschaum clay.

Cement for an Aquarium.—As "virgin rubber" (see RURAL March 20, page 214) does not grow in Dearborn, Mich., your correspondent may like to know that if the edges of his glass are bedded in *red lead* putty, made with good materials, he will have a water-tight aquarium, so far as the seams are concerned. Of course the frame must be strong enough not to "rack," hence metal of some sort is best; but wood can be made to do very well. I found shellac varnish good for covering the putty after it dried. Forty-eight hours usually hardens the putty sufficiently for use; but water should stand in the aquarium for three or four days, and be changed several times before animal or vegetable life is introduced. C. L. N., *New York City.*

New Use for Paraffin.—Dr. VOHL announces that mixed with benzole or Canada balsam, paraffin affords a glazing for frescoes much superior to soluble glass. By covering the interior of wine casks, with a film of pure white paraffin poured in melted, he has effectually prevented the spoiling of the wine and its evaporation through the wood.

To Preserve Water Pails.—W. W. F. asks "the best thing to prevent water soaking into a water pail, and yet not affect the water."

Hygienic Information.

SICK HEADACHE.

THOSE who have ever had this distressing complaint need no description of it. Its attacks are often so sudden and severe as to make one helpless for awhile. If possible, put the feet in a warm bath (coming well up the limbs) to which two tablespoonfuls of clean wood ashes have been added. But this cannot always be done, as the person may be away from home at the time of the attack, or have no one to wait upon him or her, and be too sick to wait on themselves. But a remedy may be kept on hand, that has always eased me when I have tried it; it may be carried in the pocket, so that if attacked from home, as one often is, by taking it, one may soon be relieved. This remedy is boneset blossoms, and I take them in this way:—Take what would make, when pressed together, a bunch as large as a chestnut; put it in the mouth and chew, swallowing the juice; as the bile begins to circulate in the stomach a sort of chill is often felt, and the excess of blood circulates from the head to other parts of the system.

I suppose I need not give a description of this plant, as it is so generally known, though often called by different names. Boneset, or Thoroughwort, is called *Eupatorium perfoliatum*. The whole plant is medicinal, though for headache I use only the blossoms, which appear in August; and I prefer them before they fully blossom, as they are not so easily rubbed off and wasted. It grows in wet pastures, and should be gathered when well budded for blooming, or about the first of August. It may be tied in bunches and hung up out of the way, where it will keep clean and dry.

HATTIE HOPEFUL.

DOGS AND HYDROPHOPIA.

SCARCELY a week passes but that we see reported in the daily papers one or more deaths from that horrible disease, hydrophobia. Dogs are a gigantic and alarming nuisance to the nation's community. Why, I ask, in the name of humanity, are so many worse-than-useless dogs kept? There ought to be a national dog law, fixing the tax on dog owners at $25 per year for each and every dog. This would be the most efficacious remedy for hydrophobia. "An ounce of prevention is worth an hundred pounds of cure," as far as this dreadful disease is concerned. Any one who has ever witnessed the death of a person from hydrophobia will desire to never again behold so distressing a scene. Children at play in the street; a mad dog, foaming at the mouth, rushes through the street, biting six or eight children. In the course of two or three weeks, or, perhaps, not for months, one or more of these children are attacked with the awful symptoms, and no medical aid can save them. Imagine the anxiety of the parents of the other childen who were bitten by the same dog. Editors of newspapers, and other writers, ought to make war upon dogs, and agitate the question until laws are made that will put nine-tenths of these dangerous and useless curs out of existence. J.

HYGIENIC NOTES AND QUERIES.

Remedy for Hoarseness.—I cured my child, who had hoarseness for three months, in this way:—Took four ounces fresh grated horseradish, put one pint of vinegar on it, let it stand twelve hours; then put it on the fire, covered tightly, to prevent the strength going off with the steam; strained, and added a teacup full of honey. It was then ready for use. Bottled tight. I think it an excellent remedy for all kinds of coughs.—MRS. AARON C. TICE.

Remedy for Chilblains.—P. L. SANFORD sends a remedy which he says he has given to hundreds, and never knew it to fail in a single instance:—"Take a six-ounce phial to the drug store; put in it one ounce nitric acid, one-half ounce muriatic acid, and four ounces of rain water. Make a little swab, and use it night and morning, wetting the part affected."

To Keep the Feet Warm Cold Nights.—Take a soft and pliable sheepskin, or a piece of a buffalo robe as large; put it on top of the lower sheet that covers the feet; pack the rest of the sheets or blanket top of the skin, and then tell others how to do it.—M. R. B.

Warts on the Hands.—To remove these, I simply apply strong alum water as many times per day as I find it convenient, and the warts do not remain long.—H. N. W., *Coventryville, N. Y.*

New Publications.

THE MOST POPULAR of ALL! is HAPPY HOURS, an Illustrated Monthly Magazine for all classes. Contains something of interest to everybody. Each number contains 16 large pages, filled with Choice Tales, Sketches, Poetry, Wit and Humor, Articles on Natural History and Popular Science, Tricks in Magic, Chemical Experiments, Etc., Etc. Our SPECIAL FEATURE is the Department of "Amateur Mechanics," in which will be found: Glass Blowing for Boys; Carpentry; Turning; Boats and Boating; Ships, and How to Rig Them; Taxidermy; How to Make a Magic Lantern; Paint the Slides, &c.; How to Make a Locomotive, Etc., Etc., Etc., all profusely illustrated. The CHEAPEST MAGAZINE IN THE WORLD. ONLY 25 CENTS A YEAR. Specimen Copies FIVE CENTS. Address HAPPY HOURS COMPANY, 22 Ann St., New York.

"It is worth $3," Said a lady of Prang's Chromo, "A Bouquet of Moss Roses." And so it is, yet we have given away 25,000 to subscribers to the **Star Spangled Banner**, a large 8-page paper; suits everybody. YOU want it. Only 75 cts. a year, chromo free. Address Star Spangled Banner, Hinsdale, N. H.

HILL'S

"Archimedean" Lawn Mower

In placing this LAWN MOWER before the Public for the season of 1873, it needs no recommendation, as it has a world-wide celebrity. With the improvements recently added to this favorite Mower, we are fully warranted in saying it has no equal in the WORLD. And its immense sale for the last 30 days throughout the United States is sufficient proof of the above assertion and of its great superiority. This Lawn Mower is constructed upon truly scientific principles, and it is the only PERFECTLY BALANCED Lawn Mower ever made, operated by a nut and adjustable handle, points that are indispensible, securing ease of operating, and a perfect, beautiful and level cut.

The Hill's "Archimedean"

was the FIRST (and original) BALANCED LAWN MOWER invented in this country or any other, was patented in the United States and Great Britain, and its invention brought into general use a machine that is now a necessity, and almost an indispensible article. All others now made are copies of this machine, and the public are cautioned against them.

☞ For sale by all the leading Seedsmen and Agricultural Implement Dealers throughout the United States and Canada.

Illustrated Catalogues and Testimonials post free, upon application to us or any of our Agents.

Manufactured by

The Hill's "Archimedean" Lawn Mower Co.,

Hartford, Conn.

(Works at Colt's Armory.)

Marblehead Mammoth Cabbage.

This is the largest Cabbage in the world; has been grown to weigh sixty pounds. Packages of seed with an engraving of this Cabbage, and full instructions for growing, 25 cents; per ounce, $1. I am the original introducer of this Cabbage, and my seed is pure. Descriptive Catalogues *free* to all.

JAMES J. H. GREGORY, Marblehead, Mass.

500,000 ASPARAGUS ROOTS.

One, two and three years old. Your choice of age at $5 per thousand. Sent to any address on receipt of price, with full directions for culture.

A. Y. BRECK, Bound Brook, New Jersey.

Tea Seed by Mail,

From the best China Tea Trees. $1 per packet; 6 packets, $5. My Tea trees, in the latitude of New York, grow without protection from cold, and produce the **BEST** quality of Tea. Directions for culture with each packet. Address

W. A. SANDERS, Millville, California.

OSAGE ORANGE SEED

By mail, post-paid, 75 cents per pound. Address L. G. PRATT & CO., St. Louis, Mo.

PEERLESS (Or No. 6) POTATOES.—W. C. GUERNSEY, Merchant, Castleton, Vermont, will deliver this celebrated variety to the R. R. Co. for $3 per barrel. Cash or P. O. Order.

Evergreen Seedlings.

10,000 2 years old, **$10.** By mail, post-paid, $12. Arbor Vitæ, Weeping Spruce and White Pine. For particulars, address PINNEY & CO., Sturgeon Bay, Door Co., Wisconsin.

Three New Melons.

SILL'S SCULPTURED-SEEDED, and PHINNEY'S. I introduce those new and very superior Melons as remarkable for earliness, sweetness and spiciness; very desirable either for the private garden or the market. Descriptive Catalogues, with prices, sent *free* to all.

Comstock's Combined Seed Sower and Onion Weeder, boxed and delivered at Depot or Express office: $15 35

Seed Sower (only): 10 35

Onion Weeder (only): 9 25

One of these machines will save the work of six men, and enable one to raise onions for half the cost of ordinary hand hoeing.

Catalogues free to all, giving full instructions as to the best way to raise a good crop of Onions with good seed. Grass and Clover Seed, Seed Potatoes, &c., at lowest market price. ☞ General Agent for the Planchard Churn for State of Connecticut.

Address R. D. HAWLEY,

Seed Warehouse, Hartford, Conn.

Trees and Shrubs.

We offer in our large assortment of all the **Best Varieties**, especially fine stocks of the following:

ORNAMENTAL TREES, of the best sorts.
FRUIT TREES, Apple, Pear, Peach, etc.
EVERGREENS of all the rarer sorts.
JUNIPERS, from twelve inches to three feet.
ARBOR VITÆ, 3 cts. each and upward.
HARDY ROSES, 1 and 2 years—strong plants.
RHODODENDRONS, seedling and grafted.
PURPLE BEECH—very desirable and scarce.
FLOWERING SHRUBS in large variety.
EVERGREEN THORN for Hedges, $10 ₱ 100.

☞ To these and other portions of our stock the attention of Dealers is especially invited. Packages delivered in New York. For Catalogues, address

PARSONS & CO.,

Flushing, N. Y.

Pure Hubbard Squash.

Having been the original introducer of this famous Squash, I am prepared to supply seed dealers and farmers and gardeners with the purest seed of my own raising. Catalogues with price, *free* to all.

JAMES J. H. GREGORY, Marblehead, Mass.

TWENTY MILLION

EUROPEAN LARCH & EVERGREEN SEEDLINGS.

300,000 TRANSPLANTED EVERGREENS.
200,000 TRANSPLANTED LARCHES.

The above are all grown from seeds, on our own grounds, and are far better and cheaper than imported stock. European Larch, Evergreen and Forest Tree Seeds. Send for Catalogues.

Business "	2.50	"
Reading "	3.00	"

☞ No advertisement inserted for less than $3.

SATURDAY, APRIL 13, 1872.

THE MEN NEEDED.

TO-DAY, (Friday, April 5th,) as we go to press, Prof. MORSE is buried. Two days ago a young friend asked us what profession or vocation he should choose. We replied, that wherein and whereby you can be of the most use to your fellow men. Let him who would rank highest among his fellows learn to render them the best service—let him make himself essential to them. If the object of such a man is fame, this course is the surest, and the fame acquired the most lasting. FRANKLIN is an oft-quoted example of a useful man: and his fame is more to be desired than that of any of his contemporary military heroes. MORSE, lying dead here, has more immortality than other men, just in proportion as his usefulness has been greater. His work has been to utilize what others had discovered. He harnessed the lightning to our messages and it became our messenger. Scarce any man has performed greater service, or done more to revolutionize the social relations of mankind and place them upon a basis of mutual interest, comity and peace. The nerves of the system he has established reach the remotest countries; and a touch of the finger, to-day, here in New York, makes all men bow with respect in memory of, and to honor a USEFUL MAN.

We might rehearse the list of useful men whose work has ameliorated man's condition, and added to his happiness and prosperity.—The field for such effort is constantly enlarging. The demand for thinkers and workers never ceases. The requirements for such men to-day are extraordinary. No literary, political, or professional field presents opportunities for young men, broader in their reach and influence, and richer with promised harvests, than the fields for Scientific Investigation and Practical Application. Just as MORSE bridled and saddled electricity, so the different physical sciences must be harnessed, the better to supply us with the increasing necessities of our daily life.

We are passing, or have passed, through the Era of Words, in this country. The day for which thoughtful men have longed—the Day of Deeds—seems dawning. The man of words, with his garrulity and volubility, has lost his power; people have lost faith in talk, and believe more in silence and acts. We want fewer talkers, and more thinkers and doers. We do not want the class of thinkers who think only of and for themselves; we want such as comprehend the Economy of Life and of Living, and who can furnish us more and better facilities for enjoyment;—more time to enjoy, and at less cost of money and vitality;—in other words, men who will teach us how, and help us, to squeeze out of this life the highest and best enjoyment it is capable of yielding.

Talkers tax us; doers do not. We ask for an army of volunteers—young men and women—who will not touch a study they cannot use, any more than they would buy a horse they could never hope to harness. The possessor of knowledge only, that is not productive, is a leech upon society. And his only income is derived from sitting down and propagating the same knowledge and producing other leeches. Such are like wild horses foraging in a beautiful clover field: they are too wild to be caught and rendered useful, but will and do consume the food. They are not harnessed to the plows, drills, cultivators, and compelled to tickle the soil. The knowledge of the schools must be harnessed and trained to work. Less school knowledge and more observation of natural phenomena, and study of natural laws in their relation to the practical affairs of a busy people, will help to a higher standard of excellence in what we produce, and to higher and better types of men than now clamor for petty offices and political power.

RURAL NOTES AND QUERIES.

The "Rural" Purchasing Agency.—For years we have had frequent applications to purchase and forward articles of various kinds to distant readers, and have often complied when the profits (considering time and money expended) were on the wrong side. In order to "fill the bill" of those wishing to procure articles in New York and elsewhere, a Purchasing Agency has been established at this Office, under the supervision of Mr. H. D. T. MOORE, (senior son of the Editor and Proprietor of the RURAL,) whose head is pretty level, and who will respond to all orders with promptness and fidelity. He will furnish articles at the lowest New York prices, guaranteeing all goods to be as represented. See advertisement elsewhere for further particulars.

Investments in Bonds.—A correspondent at White Haven, Penn., writes:—"Myself and a friend have a little money to invest; have been thinking of investing in railway bonds, but cannot decide which to take. Would like to ask your advice in the matter. Which would you think the best of the following:—Northern Pacific, 7 3-10 per cent.; St. Joseph and Denver City, 8 per cent.; Land Grant Bonds: Logansport, Crawfordsville and Southwestern Railway, 8 per cent.; or would you advise something else?" Concerning the bonds named we cannot advise; for it is a matter which we have not fully investigated. And, again, advice in the matter of investments is entirely out of our province, and is assuming a responsibility for which we have no inclination whatever.

Farmers' Sons Corresponding with each Other.—FLETCHER CARR, Elmira, N. Y., (P. O. Box 302,) acting upon the suggestion of the author of Daily Rural Life, that farmers' sons should correspond with each other and make collections in the various departments of Natural history, tells us that he has spent a good deal of time during several years collecting various kinds of woods, and would be glad to open a system of exchange with any young men who may wish to do so. If this system of exchange and correspondence is conducted in the right spirit, with a desire to give and acquire knowledge, it will be found both interesting and profitable, and we will gladly encourage such interchange.

Beautiful Chromos of Flowers—Are those issued for 1872 by BRIGGS & BRO., Seedsmen and Florists, Rochester, N. Y. Instead of one as heretofore, they this year furnish two large and beautifully executed pictures. Their artistic arrangement, and fine, natural coloring, render them sufficiently elegant to decorate the walls of any parlor in the land. All lovers of flowers will pronounce them charming representations of choice floral treasures—one consisting of lilies, etc., and the other a bouquet of annual, biennial and perennial plants. The size of each plate is 19 by 24 inches, and either is mailed, post-paid, on receipt of 75 cents.

Microscopes Wanted.—What manufacture of microscopes would you recommend for the use of a botanical student? I would like one that will disclose all the hidden things in plant life, about as well as I see them exhibited on paper by many who profess to have made extended researches in this science.—FLORIST, *Clinton, Mo.*

WE do not know who are the best manufacturers of microscopes, but do know that there are several that turn out superb instruments. You will have no difficulty in obtaining an excellent microscope from any of our best opticians. First, send for an illustrated catalogue of microscopes, and from this make your selection. You can get a fair kind of an instrument for $25; a good students' microscope for $50; a better one for $100, and so on upward to $1,000, or even more.

A Steam Walking Vehicle.—We have been shown the model of an invention designed to be used as a traction power for drawing loads on common roads, plows, cultivators, harrows, etc., and for all uses to which steam traction power may be put. It is very ingenious. Instead of traction wheels there are four walking arms that travel as a man does. It was invented by R. C. VERNOL, now deceased. It is in the hands of Mr. A. SLAWSON, Mahopac Falls, N. Y., who is trying to dispose of it for the benefit of the widow. It is, in our judgment, worthy the attention of those interested in steam traction power.

Are Agricultural Colleges Open to Hired Men?—"Rustic," Onondaga Co., N. Y., asks if Agricultural Colleges are open to hired men? Yes. "How much learning must a hired man possess before he enters them?" Each College has its own requirements in this matter. Send to any College of which you wish information for a catalogue—say to Cornell University, Ithaca, N. Y., which will give you the required information.

Catalogues, Etc., Received.—From G. W. WALLING & Co., Oswego, Oregon, Catalogue of Fruit Trees, Shrubs, &c....From A. HOWARD, Omro, Wis., Descriptive Circular of Fancy Fowls....From A. P. JONES, Fond du Lac, Wis., Descriptive Catalogue of Green-House and Bedding Out Plants....From CHARLES WHITNEY, Kansas City, Mo., Descriptive Catalogue of Fruit and Ornamental Trees....From G. H. WARNER, New York Mills, N. Y., Price Lists of Fowls and Eggs.

The "Ax-Grinders' Club."—Some fellow, who, it may be, designs to sue us for libel, asks us "Where does that Ax-Grinders' Club meet, of which you gave so pretty a picture a week or two since. I didn't know the American Institute had such an attachment?" Poor fellow! How green and innocent he must be!

The Electro-Magnetic Curling Comb, advertised in the RURAL of Jan. 6, is a humbug, according to the testimony of those who profess to know. We shall not insert the advertisement again. Our rule is to reject all deceptive or swindling advertisements, but occasionally find ourselves "sold" by the shrewd operators. We shall exercise more caution in future.

The Weekly Epitomist—a 36-column paper—is about to be started in Williamsport, Pa., under the editorial charge of E. W. CAPRON, Esq., an able writer and thorough reformer. It will be independent Republican in politics, and a decided opponent of rings and corruption in all parties. "Epitomist" is a good name.

Hill's "Archimedean" Lawn Mower, advertised in this paper, is an excellent machine—the claim is that it has no equal—and worthy the attention of country, suburban and town people who have lawns to be kept in order.

THE SEASON.

Harlem Springs, Carroll Co., O., April 1.—We have had a very severe winter. Ground just thawed out. Spring a month later than last year. Wheat badly winter-killed; very little snow and hard freezing. Stock doing very well. Sheep worth from $5 to $7.50; cows from $30 to $40; horses from $150 to $200, according to quality.—J. B. L.

Canton, N. Y., April 1.—We have had the coldest March, I think, that I ever knew. Fodder, scarce and high; hay, $20 to $25 per ton; grain plenty; stock looking hard; water scarce; some have had to melt snow for three weeks for large herds. Corn meal, $35 per ton; barley, 70 cents per bushel; oats, 50 cents; butter, 28 to 33 cents. No sugar made yet in this section.—A. J.

Rochester, Minn., March 18.—The winter has been very mild since Jan. 1st; no sleighing since the 1st of February. Several acres of wheat were sowed in this county (Olmstead) the last two days of February. Farm land is worth $10@50 per acre; wheat, $1.10 per bush; corn, 40c.; oats, 35c.; barley, 50c.; potatoes, 30c.; butter, 18c.; cheese, 11@18c. No rain to raise the springs and wells since April last.—R. H.

Johnsonville, N. Y., March 23.—Winter commenced about the middle of November, and has been steady cold up to this date. We have had very little snow, and the frost is said to be four feet deep. Prevailing winds, west and northwest. The ground was very dry when winter closed, and, consequently, many springs have failed. Markets are as follows:—Oats, 55c.; rye, 90c.; barley, 95c.; wool, 70c.; hay, per ton, $25@30; rye straw, $20; land ranges, $95@135 per acre.—N. L.

Westport Conn., April 1.—Last year, at this time, we were sowing oats; now there are about eighteen inches of frost in the ground. Some of the first snow that came last fall is under the fences yet. We have had very little snow; ground bare about all winter; squally to-day; prospect is a late spring. Hay is scarce and high at $30@35 per ton; a good many poor cattle; corn, 90c.; oats, 2c. per pound; butter, 30@40c.; eggs, 24c.; Rose potatoes, $1 per bushel; Peerless, $4@5 per barrel. Prospect is a short crop of hay again this year, for a great many meadows are all gone, and will not bring good crops until they are plowed and re-seeded.—H. S. W.

Jonesville, Saratoga Co., N. Y., April 4.—The winter has been a very severe one in these parts. In the South part of our county there has not been more than a week good sleighing, all told, while in the north part there has been a very large fall of snow and splendid sleighing for about four months. March "came in like a lion," and went out with one of the heaviest snow-storms of the winter. The frost has penetrated in many places to a depth of four or five feet. This morning I saw boys skating on the ponds which have gathered in the fields. The ground is still covered with snow. The prospects for early sowing are rather gloomy at present. Corn sells at 80c.; oats, 53c.; rye, 75c.; butter, 30c.; hay, $25 to $30 per ton.—F. B. W.

Sanderson, Baker Co., Fla., March 26.—It has now been raining seventy hours, almost incessantly. The whole face of the earth is in a perfect flood; the same has occurred here at intervals of from four to eight days for the last six weeks, although not quite so heavy as the present rain; yet our crops have been, and yet are, rotting in the ground. Corn, beans, peas, sweet potatoes, watermelons and most other seeds planted have rotted, and we shall at this late date be compelled to plant over again, as soon as these torrents cease. Our peach trees are now in full bloom—one and a-half months behind the usual time. Orange trees are just blooming—one month behind time. We have had an exceeding cold winter and spring.—C. W. T.

Kalamazoo, Mich., April 1.—Our season is full four weeks later than usual. Last week we had a few spring-like days, which brought "Jack Frost" out of the ground six or eight inches, but he seems slow and tardier than usual this spring, and acts as if he had a "sure thing on us" this time. Saturday, at noon, it began raining, and, at night, commenced freezing on the trees, and continued to do so most of the night, with considerable wind toward morning. All things considered, it was one of the most fearful ice-storms I ever knew. The limbs of almost every fruit and shade tree of "any size," except evergreens, are badly broken down, and some trees ruined entirely. I think many of the peach orchards are used up, and as there is a small supply of peach trees in the nurseries this spring, it will be impossible to replace all that are needed. It is now 8½ o'clock on Monday morning, and the trees are still loaded with ice, I should estimate from four to ten times their own weight. The air is now still, and, being favored with a bright sun, most of the ice will drop before night. Farm hands get from $16 to $20 per month, and board; good, *reliable* hands, a little more.—E. M. P.

South Trenton, Oneida Co., N. Y., April 1.—The coldest March ever known in Oneida county. Thermometer run the lowest; cellars froze the hardest; more potatoes lost by frost, both in cellars and out-door pits, than was ever known in one year before. It has been the coldest winter in forty years until the driest March. Water the scarcest; springs the lowest; wells the dryest, and water mills the idlest ever known in this vicinity. Stock has suffered for water. Many farmers were obliged to melt snow for their entire stock; very many haul water for large herds of cattle, and have done so for the past two months. Furious winds from all points of the compass, but the prevailing winds west, north and south. Roads are badly drifted; for miles travel is diverted from the road through the adjoining fields. Plenty of hay in the country, and cattle are looking very well, notwithstanding the scarcity of water. Thermometrical averages, &c.:—Highest point attained, the 12th, 34°; lowest, the 5th, 22° below zero. Five mornings the temperature was below zero. Five observations at 2 P. M., above the freezing point. Average temperature at 7 A M., 16° 9'; at 2 P. M., 24° 30'; at 9 P. M., 15° 14'. Temperature for the month, 17° 29'. During the month there were only three apparent spring days; the rest may be classed as cold, winter weather.—STORRS BARROWS.

PUBLISHER'S SPECIAL NOTICES.

The Rural New-Yorker is electrotyped, and hence Back Numbers can always be supplied. Copies for sale by all News Dealers; price Six Cents.

NEW QUARTER—SUBSCRIBE NOW!

ALL OUR READERS interested in the success of the RURAL NEW-YORKER will please bear in mind that a New Quarter commenced *last week*—April 6th. Now, therefore, is a good time to subscribe, and we trust Agents and others will govern themselves accordingly—notifying non-subscribers of the fact and inviting them to join the Rural Brigade. Those forming new clubs, or making additions to old ones, will be entitled to the same Premiums offered in January—so that all aiding the RURAL will not only have the consciousness of doing good to others, but be liberally rewarded therefor.

Additions to Clubs are always in order, whether in ones, twos, fives, tens, or more. A host of people are subscribing for papers about these days, and we hope our Agent-Friends will give everybody an opportunity to subscribe for the best.

The Rural New-Yorker is sold by News Dealers generally throughout the United States and Canada at Six Cents. The Trade is supplied by the AMERICAN NEWS CO., 119-121 Nassau St., New York.

Show Bills, Specimen Numbers, Etc., of the RURAL NEW-YORKER sent free.

Biographical.

DEATH OF PROF. S. F. B. MORSE.

THE world will learn with regret of the death of Prof. SAMUEL F. B. MORSE, the father of telegraphy, although he died full of years and honors. He died at his residence, in New York City, of paralysis of the brain, on April 2d, in the 81st year of his age. He was born in Charlestown, Mass., April 27th, 1791, and was the eldest son of Rev. Dr. JEDEDIAH MORSE. He went to school at Andover, and at 14 years of age entered Yale College, where he graduated in 1810. In 1811, he sailed for Europe with WASHINGTON ALLSTON, to study painting. He was abroad four years, when he returned home, and practised his profession for fourteen years, when he again went abroad, in 1829, to prosecute his studies, returning in 1832. In 1826, he founded, with others, the National Academy of Design, becoming its first President. He was also elected Professor of Art in the New York University. His success as an artist was assured, but in 1832, while coming home from Europe for the second time, he had his attention called to the subject of electro-magnetism, and conceived the idea that intelligence might be transmitted instantaneously by electricity. He at once became absorbed with this idea, and before the voyage was over, had completed the general plan of his invention. After much study and difficulty, he satisfied himself, in 1835, of the merits of his invention, and, in 1837, demonstrated it to the public in the University of New York. He brought his invention before Congress, in 1837-38, but met with opposition and ridicule, and no help. He again visited England and France, but to no purpose. At this time he met in France, DAGUERRE, and shortly after his return to America, received from him his process for taking sun pictures. Prof. MORSE, in 1839, took the first daguerreotype in America, it being a view of the Unitarian Church on Broadway, opposite the New York Hotel. In 1843, Congress passed his telegraph bill, and in 1844 the first line was put up between Baltimore and Washington. To-day, they stretch all over the world.

No American has been so honored by the crowned heads of the Old World as Prof. MORSE, from whom he has received numerous decorations. At an early day Prof. MORSE suggested that the telegraph should be united with the Post-office Department. It looks now as if his suggestion would soon be acted upon. On the 29th of December, 1868, a grand banquet was given to Prof. MORSE at DELMONICO'S, in New York, at which Chief Justice CHASE presided and Sir EDWARD THORNTON, the British Minister, made a speech. On June 10th, 1871, a bronze statue to Prof. MORSE, costing $11,000, was erected in Central Park, it being contributed chiefly by dollar subscriptions from the telegraph operators in the country. A grand reception at the Academy of Music followed the inauguration of the statue, upon which occasion Prof. MORSE sent dispatches to all parts of the world. His last appearance in public was upon the uncovering of the FRANKLIN statue, in Printing House Square, on the 17th of January, 1872. He was feeble at the time, and left a sick bed to take part in the ceremony. He has always been held in great esteem by his fellow citizens as a Christian gentleman, as well as a benefactor to his race. His death will cause universal mourning, for one greater than a king has fallen.

The portrait of Prof. MORSE, herewith given, was engraved from a photograph taken last year, and will be readily recognized by all who have of late years seen the eminent deceased.

— The funeral of Prof. MORSE was held at the Madison Avenue Presbyterian Church (Dr. ADAMS'S) on Friday, the 5th inst., whence the mortal remains of the great electrician were borne to their last resting place—Greenwood Cemetery.

CHARLES SUMNER.

SENATOR SUMNER (says a Washington letter writer) is a prodigy of physical endurance. I have it from his own lips, that for many years, indeed for nearly his whole life, he has worked fourteen hours a day. He has never been a smoker. He lives "generously," and, in a very temperate fashion, is a wine-drinker. In his younger days he was a famous pedestrian, striking off for his dozen miles without the least difficulty. He has given all that up. He literally takes no exercise. Living so heartily, working so laboriously, shut up to his pen and his books for so many hours, it is astonishing that he keeps so well. But he is a man that will go suddenly, when he does go.

Social Topics.

PLANT LIFE IN TOWNS.

THE health of towns is a hackneyed subject. We seldom hear about health of plants in towns. Yet the two are not only nearly correlated, but well-nigh identical. Were plants healthy, the inhabitants would probably be so likewise, and the obverse is true. Towns in or near to which plants refuse to thrive are also those most fatal to man. The primary foundations of health in both are heat, light, food, cleanliness, pure air and suitable water. With the single exception of heat, which in the open air may be assumed to be nearly equal in town and country, it must be admitted that large towns imperil the purity, lessen the quantity, and interrupt the constancy of most if not all the other essentials of health. In many large towns the light of the sun is obscured for more than one-half its shining hours. Therefore, who can wonder at the pale faces which one finds among men, women and children, and the shabby aspect of plants in towns? Heat is the great quickener, light the chief strengthener, of plants. They ever turn toward the light. The reason why so many die in dwelling-houses is that they have so little light. They linger, pine, and refuse to grow in many towns for the same reason. The pestilence that kills plants by thousands is bred of that semi-darkness which hangs as a death-pall over so many of our smoke-capped cities. When that darkness flies before the rigid enforcement of a smoke-prevention act applied to every fire, then indeed will plants in towns rejoice, be clothed with new strength and adorned with fresh beauty.—*The Garden.*

PROF. S. F. B. MORSE.

AN ANECDOTE OF MAZZINI.

AN interesting anecdote about MAZZINI appears in a new book just published in Paris under the title of "Le Dernier des Napoleons." Sir JAMES HUDSON, then British Ambassador at Turin, once requested CAVOUR to give an audience to an English traveler who had just arrived. The Minister received his visitor very early in the morning, as was his custom. After the usual courtesies had been exchanged, the "Englishman" described to CAVOUR a deep-laid plan which he had conceived for the restoration of Italian independence. CAVOUR was astonished at the boldness and thoughtful foresight shown by his interlocutor, and expressed his regret at not being sufficiently conversant with the English language to enter fully into all the details of the scheme. The stranger then went over the whole plan in the purest and most elegant Italian. As he was taking his leave, CAVOUR said to him: "You talk politics like MACCHIAVEL, and Italian like MANZONI. If I had a countryman like yourself, I would gladly give up to him my place as President of the ministry. Pray tell me what I can do for you." "If such a man as I were your countryman," was the reply, "you would sentence him to death. If you wish to show your appreciation of my advice, carry it out, and liberate Italy. So far, at least, the protection of Sir JAMES HUDSON will suffice for me." The stranger then left the room, first handing his card to CAVOUR, who read on it with amazement the name of MAZZINI.

MASTER AND MAN IN JAPAN.

No feature of Japanese society is more curious than the relations betwen master and man. The master admits his servant (provided, of course, that he be of the military class) to his intimate society; but the servant never assumes a liberty. He takes his place at dinner with the utmost humility, and having done so, bears his share of the conversation, addressing freely not only his master, but even guests of the highest rank. The master will pass his own wine-cup to his man, as if he were an honored guest, and for a while they would appear to any one not acquainted with a language most fertile in subtle distinctions to be upon perfectly equal terms. Yet, the moment the feast is over, the man retires with the same profound obeisances and marks of deference with which he entered, and immediately relapses into the servitor; nor will he in any way presume upon the familiarity, which, having lasted its hour, disappears until occasion calls it forth again. Feudalism strips service of servility, and although the feudal system is a thing of the past, its traces must long remain. — *The Cornhill Magazine.*

GOOD ADVICE.—Speak well of your neighbors, or do not speak of them at all. A cross neighbor may be made a kind one by kind treatment. The true way to be happy is to make others happy. To do good is a luxury. If you are not wiser and better at the end of the day, that day is lost. Practice kindness, even if it be but little each day. Learn something each day, even if it be but to spell a word. Do not seem to be what you are not. Learn to control your temper and your words. Say nothing behind one's back that you would not say to one's face.

ENGLAND AND AMERICA.

ONE people in our early prime,
One in our stormy youth:
Drinking one stream of human thought,
One spring of heavenly truth;

One language at our mother's knee,
One in our Saviour's prayer—
One glorious heritage is ours;
One future let us share.

The heroes of our days of old
Are yours, not ours alone!
Your Christian heroes of to-day,
We love them as our own.

There are too many homeless lands,
Far in the wild free West,
To be subdued for God and man,
Replenished and possessed:—

There are too many fallen men,
Far in the ancient East,
To be won back to truth and God,
From cramping bonds released:—

There is too much good work to do,
And wrong to be undone:
Too many strongholds from the foe
That must be forced and won—

That we whom God hath set to be
The vanguard of the fight,
To bear the standard of his truth,
And to defend the right,

Should leave the mission of our race,
So high, and wide, and great,
On worldly points of policy
To wrangle and debate.

Nay, side by side, in East and West,
In wild or heathen lands,
One prayer upon our hearts and lips,
One Bible in our hands,—

One in our earliest home on earth,
One in our heavenly home,
We'll fight the battles of our Lord
Until His kingdom come.

Our Story-Teller.

NETTIE STERLING;

OR,

WHAT ONE WOMAN DID.

BY DE FORREST P. GUMMERSON.

[Concluded from page 234.]

CHAPTER III.

THE days had slipped away so rapidly that it was June ere NETTIE was aware of it. She had been so busy with her numerous duties that she had not felt as yet how isolated was the life she was living. With the exception of the doctor and his wife and the minister, no one had been to see them since they had come into the place. Mr. STERLING had felt this somewhat keenly; but knowing that his wife had not given it a thought, did not choose to pain her by calling her attention to it. I think there were some honest hearts in the place that yearned to go to this woman and welcome her in their midst; but fashion, like a cruel tyrant, held undisputed sway here — and fashion did not go, so how dared they?

Fashion was represented here by one Miss JELF and a few of her *confreres*. She was a woman who had been abroad some, pronounced the little French she did know horribly, dressed with exquisite taste, and declared that "to be a true lady, one must avoid associating with all women who worked for a living — such as Mrs. STERLING." This she said openly one evening, at one of the tea-drinkings of the M. E. Society of Woodvale, and, after that, who dared say otherwise, if they would belong to the *creme de la creme* of society?

After this it was not long in reaching Mrs. STERLING'S ears. One of BIRDIE'S girl friends got angry with her one afternoon, and out it came—how that her ma had said, that Miss JELF had said, etc. To say that it did not cause any pain to Mrs. STERLING would not be true. She was a woman of fine instincts, cultivated and refined; and in the days she had spent at her father's home had not been accustomed to work. In fact, I think she would, like the most of us, have chosen ease and luxury rather than to toil late and early. But she was a woman who, seeing a great duty before her, would march straight towards its fulfillment, instead of turning aside because a certain set chose to thrust her out of their circle on account thereof. A brave woman, in fact one who knew not fear — one beside whom such a woman as Miss JELF need stand only for one moment to suffer by comparison.

And NETTIE STERLING saw that her duty was to provide for her sick husband and their little child. So the days that came after Miss JELF had set up the line between a true lady, and one who was not, found her as busy as ever among the flowers, and in the garden at work. If Miss JELF had passed on some of these mornings, I think

she would have suffered more than ever, by comparison with Miss STERLING, for on her cheeks, the roses were always in bloom, while Miss JELF'S wore a pinched and frozen look—but then she said "too much color indicated low breeding." NETTIE always dressed for her work, and so, at times, did look a little "outlandishly," as some of the villagers remarked. That she, at times, dressed with exquisite taste and neatness, none of them ever knew, because they never came to her house to see; but if they had seen the radiant vision that floated through the rooms, and sat sometimes, when her labor for the day was over, by the bedside of her sick husband, they would have started in surprise, and, I suppose, would never, for one moment, identify her with the woman who dressed so "outlandish," and worked in the garden all day.

Dr. WILDRICK came down one day in great haste. "What does this mean?" he said. "I have just learned that you are not recognized here in society. FRED LANNING came into my office to-day; he has been spending a week with some cousins in Woodvale, and had a glorious time," he said. "And met all sorts of people, gone everywhere, in fact, and liked the place muchly." I said it was a nice place, that I had friends living there, and hoped he had met them. Then he asked me the name of my friends, and when I told him, he almost jumped out of his chair,

"By jove!" he said, "It's a downright shame? STERLING! STERLING?" said FRED. "Yes, that's the name. Dr. WILDRICK, if they're friends of yours, my advice is that you go down to Woodvale and set them right with society there. Why, only Tuesday night last I was at a tea-meeting, or some other heathenish affair, and these people were literally picked to pieces. Woman works for a living, don't she? raises flowers for sale or something like it—and supports a sick husband. By Jove! If I'd a'known she was a friend of yours—well, I did tell them that I thought she was the 'noblest Roman of them all,' for I did not believe there was one present who could do it if they were placed on the list of women with sick husbands."

"Of course, FRED raised a 'hornet's nest' about his ears, and fled. But when I leave, Mrs. STERLING, the next will be a fragmentary thing, for I'll have it down, I promise you."

Dr. WILDRICK sometimes let his impulses run away with his judgment. I am afraid he would have done so at this time had it not been for the gentle persuasiveness of Mrs. STERLING. She told him that she "didn't care at all about it; that it was much better as it was, for it enabled her to devote the time that she might otherwise have to bestow upon company, to her garden. Then, too, it will come out all right: the edict of a certain few does not always 'banish one from Rome.'"

Dr. WILDRICK spent the night with the STERLINGS, and in the morning went back to the city, believing more and more in the rare good sense which Mrs. STERLING possessed.

Mrs. STERLING had succeeded even better than she had expected. Her flowers thrived finely, and blossomed in profusion. Each day she sent to the city florist a goodly number of bouquets, and he readily disposed of them. I think he took a certain pleasure in selling them for her. Perhaps this was owing a good deal to Dr. WILDRICK, who told him so many good things of her, as to cause him to think her one of the noblest women in the world—as she was.

The proceeds from the sale of her flowers had enabled her to live well, and she had already saved over five hundred dollars, which she wished to pay the doctor on her home. But when she offered it to him, he refused it, but told her to use it in building a hot-house for the raising of plants in winter—a plan she had cherished all summer. She consulted forthwith the best carpenter in the village, and he set about the work at once; so that by the latter part of October, it was all finished and stocked with plants. There were Azalias, Japonicas, Tuberoses, Camellias, and other flowers, such as were used at funerals and weddings.

This plan worked charmingly, and was the cause of an ultimate fortune. In the winter flowers brought higher prices than at any other time; and really this woman's success among them was something wonderful. "If her luck should continue," she told her husband, one day, "she would yet be able to take him out to ride in their own carriage."

EDWARD STERLING looked into his wife's face and smiled. The picture was a bright one to think of; but to him it had its cloud. He knew that the days of his earthly life were numbered. He had in reality gained but little strength, and of late his cough had grown to be something terrible. His face, too, wore the hectic flush so common to consumptives, and his eyes had a longing look, as if trying to penetrate into the future. He could not bear to tell NETTIE that her bright dreams could never be realized in regard to him. He was not blinded; but then would it be well to add more to the burden this woman already had to bear? No! With GOD'S help, then, he would bear it alone.

But the child, BIRDIE, seemed to have a dim foreboding that her papa was going to leave her—partly from words which he let drop at times when he held her upon his lap and caressed her. Once—only once—he spoke to her of a journey he was soon to take to a far-off land, where the flowers always blossomed, and there should be no pain.

One glance from her bright eyes into his, and the little head was pillowed upon his shoulder—his face, in touching hers, was wet with tears. After she had cried until the tears refused longer to flow, she raised her face to his and, with the tenderness that only a child's voice can give to words, said:

"Papa!—dear, dear papa!—don't die!"

"But if GOD chooses to take me, BIRDIE?"

"Who would take care of me, then, papa?"

"GOD!"

"Oh, papa, don't you love mamma and me too well to die?"

"Love mamma and you?——"

He could find no more words. Only a great cry of anguish came from his very soul, and a look so imploring that the parting might be easy to bear went up to his Father in Heaven. After this he never showed her, by word or look, how near he felt the parting to be, but went on trusting in the mercy of GOD to sustain him in the hour of trial.

As to NETTIE, her belief had been so strong that he would get well, as to blind her eyes to the fact that he was each day growing thinner, and thinner. It was, that when he did get well, he might have every chance of enjoyment, that she toiled on day by day among the flowers and fainted not.

But one day the awakening came. Her golden dream was at an end. When she awoke in the morning, she found that her husband could not speak to her—that during the night he had been bleeding again. He never did speak to her after that, only by signs; and when the night came, shutting her in with its sable mantle, his soul passed out and was lost to her in the blackness that lay all around. But in the other life it had found the new light.

CHAPTER IV.

WHEN Mrs. STERLING came home from her husband's funeral, and entered the house where, for so many days and nights she had tenderly cared for him, it seemed as if every purpose in life was gone. To take up the broken threads and go on, alone, was no easy thing to do—nerve herself as much as she could for the task. You, who have seen some loved one, for whom you have toiled, and for whom you lived, laid into the grave, will know what this woman had to suffer during the first months of her widowhood. If EDWARD STERLING had been a care, and a trial at times, this woman's love had grown stronger at each new proof of it. Twenty times, now, in a single night, would she awake from a deep sleep to answer his fancied call, and then fall back upon her pillow, her face bathed in tears.

BIRDIE was a great comfort to her; and now that her father was really dead and buried, childlike she had, to some extent, thrown off the first bitterness of grief. So she loved to talk of him to her mother, and of the home to which he had gone. Once she told her what he had said about the flowers that always bloomed there, and wondered "if papa would get rich by selling them." Perhaps this child and her wants kept NELLIE STERLING from fainting by the way. I do not know. But when the winter had passed she entered once more upon the old life and tended to her flowers as before. Once she said, "I'm doing this for you, BIRDIE—so that papa's little girl may go to school and learn how, when she grows up, to be a lady."

"Like Miss JELF, mamma?" BIRDIE asked.

"No, darling. But with the purpose of a noble woman, loving at all times to do good."

BIRDIE wondered if Miss JELF was so very bad, but did not ask her mother to solve the mystery for her.

* * * * * * * *

Two years have passed since Mr. STERLING died. The gloom occasioned by his death to some extent has gone. Dr. WILDRICK and his wife came down often now, for the latter is in poor health, and these glimpses of green fields, the doctor declares, does her good. Mrs. WILDRICK thinks it is a shame that so perfect a woman should be lost so entirely to society, and tells the doctor at each visit that he must do something to break the ice that had, as it were, frozen her in from her neighbors.

It was possible, it seemed. Dr. WILDRICK had lately sent another patient to Woodvale for the recovery of his health. It was not a case like Mr. STERLING'S; only the close confinement to the city and business had wore upon this man to such an extent as to demand a change of occupation, if he would be strong again. This man, LAROQUE by name, possessed a large amount of wealth, and had a wife who was as rich in womanly graces as was her husband in gold. Dr. WILDRICK had given them the history of the STERLINGS in full—even to the neglect of the village people—and begged that they would see that she no longer lacked for friends. Mrs. LAROQUE promised that she would see to it that Mrs. STERLING had more than enough—and she kept her word.

From the day on which Mrs. LAROQUE held her first reception, NETTIE STERLING became one of the stars of Woodvale society. She was a brilliant woman at all times, but now, shorn of the old and faded dresses that she usually wore about her work, and dressed in a rich purple silk, she was charming. Mrs. STERLING wore no mourning for her husband. She did not believe in it. It never seemed quite right to her to sit in sackcloth and ashes, and dress in sable robes, for a soul which had entered into glory and walked in robes of white.

Money being the god most worshipped in Woodvale, it was quite an easy task for those who might not have admired NETTIE STERLING for herself to fall down and worship at the shrine of her bank account, when once it became known that she possessed such a thing; and during the two years that had passed, she had managed to put by a considerable sum. Then, too, she had bought more land, built more green-houses, and kept two gardeners, and was supposed to be rapidly accumulating a fortune—which supposition was entirely correct.

Once on the road to fortune, it is easy to keep the ball rolling—at least NETTIE found it so. She did not work in the garden now. BIRDIE was away at school; and then, too, she felt that the time had passed when she need delve and toil. So, one day, she sent for BRIDGET DELANY, and that lady sent back word:—"I'm ingaged for the month, ma'am; but whin me month is out, I'll come till ye, were yez at the ind of the earth."

And come she did. So NETTIE was once more provided with help that could be depended on—a streak of fortune that does not befall all good housewives in the nineteenth century.

After BRIDGET came, Mrs. STERLING had plenty of time to go out and return calls. To this luxury she did not give much attention, however. I think she felt the former slights she had received more now than when they were given. Much of her spare time was devoted to visiting the sick and the poor, though of this latter class Woodvale was almost free.

She had to go often to the city now—for good Mrs. WILDRICK was very ill, and needed the kindly sympathies of one of her own sex, and one, too, whom she loved. There had always been a strong affection between these women; the many little kindnesses the one had given, and the noble nature of the other, had cemented the tie between them too strongly to be broken. It was plain to Dr. WILDRICK that his wife could never be well again; and yet he did not tell her so; but she knew this herself—a sort of subtle knowledge, that comes ofttimes to the sick, had whispered it to her one night, and she bowed her head without a murmur. On the day following that on which this knowledge came to her, Mrs. WILDRICK called her husband to her bedside and told him that she felt the shadow of death was drawing nearer and nearer unto her; and that she had one request to make of him. Life would be very dreary, left quite alone, and so she wanted him to promise her that after a suitable time had passed, after she was dead, that he would marry Mrs. STERLING—the one woman, in all the world, whom she could willingly see in her place. And he, wishing to gratify her every request, promised her. After this promise had been given, she seemed to give him up entirely, and each day grew weaker, and paler, until the end came.

Two years have passed since Mrs. WILDRICK lay in her coffin amid rosebuds and tuberroses in the great parlors of the doctor's house, and to-night the promise made to the dying wife is to be fulfilled. In her own elegant home, NETTIE STERLING is dressed for her second bridal. Orange blossoms send forth their sweet fragrance from amid her hair, as she watches from her window the coming of her promised lord. He comes at last, somewhat older looking than when first he met Mrs. STERLING. His hair was black then, now faintly streaked with gray. His face, too, bears the marks of past suffering and sorrow, and yet a soft, refined look, such as those wear who know that life is not worth all of this world. He takes his place by the side of the one woman in all the world dear to him now, and leads her into the parlor where are assembled the white-headed man of GOD and the guests, and as they there vow to cherish each other until death do them part, they breathe a silent prayer to the All-Father who has given them this great joy. Of the ones gone out from them, neither cease to think, and both feel and believe they are looking down upon their union with approving looks.

A short journey to the sunny South, and then Dr. WILDRICK will bring his bride to his home in the city. The old home at Woodvale NETTIE intends to keep, and they will spend their Summers there. If ever BIRDIE marries, it is the intention of her mother to bestow the Woodvale home upon her as a wedding-gift. But as this young lady is still at school, and does not mention the name of a lover in her numerous letters home, that event may be a long way off—at least her mother hopes so.

At the time of her marriage with Dr. WILDRICK, Mrs. STERLING had in bank the sum of twenty thousand dollars, which he has invested for her in a way that will bring a large interest, and this amount, together with the place, she had earned by the cultivation and sale of flowers. The sale of flowers has now become one of the great specialties of the day, and there are those who have accumulated wealth thereby, who can at least acknowledge that much of their own success is due to this woman, who was one of the pioneers of the trade.

Sabbath Reading.

THORN-CROWNED.

BY ANNIE HERBERT.

Oh! Sacred Head that knew no guile,
And found a thorny pillow—
Thy lips have taught us how to smile
In grief's o'erwhelming billow;
But we forget Thy lessons sweet,
And, looking for the morrow,
We lose the footprints of Thy feet,
That mark the sea of sorrow.

Thou Heart of mercy fathomless,
And love beyond revealing,
Our sins and burdens on Thee press—
They pierced Thee for our healing;
Thou art our refuge, sure and high,
When fiercest tempests gather;
And there, from later floods we fly,
Remembering our Father.

Thy thorny crown is white with stars
Within the Heaven of glory,
And Love divine, through earthly jars,
Repeats its tender story:
The beacon flame of Galilee
Still burns to cheer our sorrow,
And feet that stilled the olden Sea
Will walk the wave to-morrow.

THE SCOPE OF PREACHING.

A PREACHER is a teacher; but he is more. A teacher brings before men a given view, or a department of truth. He expends his force upon facts or ideas. But a preacher assumes or proves facts and truths as a vehicle through which he may bring his spirit to bear upon men. A preacher looks upon truth from the constructive point of view. He looks beyond mere knowledge to the character which that knowledge is to form. It is not enough that men shall *know*. They must *be*. Every stroke of his brush must bring out some element of the likeness to Christ which he is seeking to produce. He is an artist—not of forms and matter, but of the soul. Every sermon is like the stroke of Michael Angelo's chisel, and the hidden likeness emerges at every blow. A teacher has doubtless a remote reference to practical results; but the preacher, not indifferent to remote and indirect results, aims at the immediate. "Now! *Now!*" is his inspiration. "Cease to do evil, at once. Turn toward good immediately. Add strength to every excellence, and virtue to virtue, now, and continually." The effect of his speech upon the souls of men, is his objective. It is this moral fruit in men's souls for which he plants his truth, as so much seed. * *

The preacher is one who is aiming directly at the ennobling of his hearer. He seeks to do this partly by the use of truth existing as a philosophy or ordinary facts, but yet more by giving to such truth the glow, and color, and intensity, which are derived from his own soul. If one may so say, he digests the truth and makes it personal, and then brings his own being to bear upon that of his hearers. All true preaching bears the impress of the nature of the preacher. "Christ in you." The truth is that which is represented in Jesus Christ, but it is that truth "*in you*," or as it exists in each man's personality, which makes it a living force.—*Beecher's Lectures on Preaching.*

THE DAY OF REST.—Never was there a more blessed institution than the Sunday, the sacred day of rest from labor. For the soul's health and the body's health of the human race, on at least one day in the seven there should be an ever-recurring intermission of daily toil. Thus, let a man attain to the period of three score years and ten, he has gained a holiday of ten years' duration, even if his lot has been labor for the remaining three score years. Let childhood be taught to use, and manhood discreetly use, this blessed breathing time, as a day on which to raise the thoughts beyond the world, not less than for rest from labor and mental anxiety.

DR. JOHNSON, when in indigent circumstances, was offered a rectory if he would enter into orders. But this great man, sensible, as is supposed of the asperity of his temper, declined it, saying: "I have not the requisites for the office, and I cannot in my conscience shear the flock which I am unable to feed." Well would it have been for the church of Christ had all who have entered her ministry been equally conscientious.

HUMILITY is a grace that adorns and beautifies every other grace; without it, the most splendid natural and acquired acquisitions lose their charm.

VERY few in the world have their passions adequately occupied; almost every body has it in them to be better than they are.

Ladies' Port-Folio.

ONLY A DREAM.

BY D. M. JORDAN.

To-night, beside the firelight's glow
And 'neath the lamplight's cheerful beam
While rocking idly to and fro
I fell upon a pleasant dream,
A kind of sweet forgetfulness
Of all the jarring sounds of life,
A vague and shadowy consciousness
Of living far above the strife.

With tender feet I brushed the dew
In grassy lanes of early May,
With tender heart I wept for joy
Or laughed amid my happy play.
The skies bent down and touched the earth,
My world lay all beneath my gaze,
And the bright beacon star of hope
Sped o'er my path her cheering rays.

I started from my happy dream,
The fire had waned to ashes gray,
The failing lamp shed fitful gleams,
Like lights that search for one astray.
The vision of a vision bright,
The happy dream within a dream
Fled, as the shining stars of night
Fade out before the morning's beam.

Without, I heard the wailing wind
That blew the chill November rain,
Like stormy sobs of passionate woe
In tears against my window pane.
The skies, that in my happy dream
Bent down to kiss the smiling land,
Starless and moonless frowned at me—
Gloom met my gaze at every hand,

And but for one sweet star of hope
That shone out through the stormy night,
I might have doubted that the gloom
Would fade away by morning's light.
Thus ever, when some bitter doubt,
With poison chalice drugs the soul,
I see the glorious star shine out
That points me to a heavenly goal.

ROMANCE IN REAL LIFE.

The following interesting and romantic story is related by the Lewiston (Maine,) Journal:

About fifteen years ago, a young Scotchman had as neighbors, in the mountain regions of Scotland, a family in which there was a little girl of four years. One day, he took the little girl on his knee, and playfully told her father:—"One day I will make her my wife." Not long after, the father, mother, and girl resolved to emigrate to America, which they accordingly did, landing in Portland, in the year 1857. In a few years, the family removed to Mexico, Oxford Co., living there till last year. Not many years after this family came to this country, the young man who had trotted the little girl on his knee resolved to emigrate to America, which he did. Arriving in this country, he proceeded to Montana Territory, where, by good luck and industry, he managed to amass a large fortune. Having richly filled his coffers, his mind reverted tenderly to thoughts of love, and he recalled his early vow, to some day wed the little yellow-haired girl he used to trot on his knee to "Banbury Cross." He knew her parents had emigrated to America, and that they had landed in Portland. He journeyed to Portland; then diligently inquired of their whereabouts, and learned the family was in Mexico. Up to Oxford County he turned his steps, and on approaching the house where the object of his pilgrimage was said to live, he saw a yellow-haired maiden on the porch.

"Does Mr. —— live here?" he asked.

"Yes, sir," replied she of the yellow hair.

"Is your name Annie ——?" said the Scotchman.

"Yes, sir," replied the blushing girl.

"Then I love you," was bluntly interjected by the Scotchman.

The young lady of course thought he was insane, and scampered off into the house.

The Scotchman soon found the father and mother, who recognized and gladly welcomed him.

"Don't you remember fifteen years ago I took your little four-year-old girl on my knee in Scotland, and said I meant to make her my wife?"

"Oh yes! I remember, but not for many years have I thought of those happy old days."

"I am here to redeem my pledge," said the Scotchman.

"Let the girl speak for herself," said the gentleman, choking with emotion.

It did not take a long time for the young lady to get acquainted, nor long for her to decide that this Scotchman was just the man she had been waiting for all her life.

"I want to be married at once," said the Scotchman.

"But I've just engaged to work in Lewiston," said the young lady. Then, getting hold of a bright idea,—"I have it—I'll go down there to work, and then, I'll not like, it, you know, and I'll come back here to be married."

Down to Lewiston went the girl; at work for a week was she, when she then concluded she did not like to do housework, and returned home.

Next week the parson drove up in his two-wheeled chaise, and the twain were made one.

The Scotchman and his young wife are now settled happily in Iowa, where the old folks, who have finally agreed that truth is stranger than fiction, now comfortably pass their declining years.

THE BABY

Who knows not the beautiful group of babe and mother, sacred in nature, now sacred also in the religious associations of half the globe? Welcome to the parents is the puny struggler, strong in his weakness, his little arms more irresistible than the soldier's, his lips touched with persuasion which Chatham and Pericles in manhood had not. The small despot asks so little that all nature and reason are on his side. His ignorance is more charming than all knowledge, and his little sins more bewitching than any virtue. All day, between his four or five sleeps, he coos like a pigeon-house, sputters and spurns, and puts on his faces of importance; and when he fasts, the little Pharisee fails not to sound his trumpet before him. Out of blocks, thread-spools, cards, and checkers, he will build his pyramid with the gravity of Paladio. With an acoustic apparatus of whistle and rattle he explores the laws of sound. But chiefly, like his senior countrymen, the young American studies new and speedier modes of transportation. Mistrusting the cunning of his small legs, he wishes to ride on the necks and shoulders of all flesh. The small enchanter nothing can withstand—no seniority of age, no gravity of character; uncles, aunts, cousins, grandsires, grandams—all fall an easy prey; he conforms to nobody, all conform to him; all caper and make mouths, and babble and chirrup to him. On the strongest shoulders he rides, and pulls the hair of laureled heads.—*Emerson.*

CLIMATE AND CHARACTER.

Perhaps the influence of the four great winds on character is only a fancied one; but it is evident on temperament, which is not altogether a matter of temperature, although the good old deacon used to say in his humble, simple way, that this third wife was a very good woman, but her "temperature was very different from that of the other two." The north wind is full of courage, and puts the stamina of endurance into a man, and it probably would into a woman too if there were a series of resolutions passed to that effect. The west wind is hopeful: it has promise and adventure in it, and is, except to Atlantic voyagers America-bound, the best wind that ever blew. The east wind is peevishness; it is mental rheumatism and grumbling, and curls one up in the chimney-corner like a cat. And if the chimney ever smokes, it smokes when the wind sits in that quarter. The south wind is full of longing and unrest, of effeminate suggestions, of luxurious ease, and perhaps we might say of modern poetry—at any rate, modern poetry needs a change of air. I am not sure but the south is the most powerful of the winds, because of its sweet persuasiveness. Nothing so stirs the blood in Spring, when it comes up out of the tropical latitude; it makes men "longen to gon on pilgrimages."—*Scribner's Magazine.*

DAILY BENEVOLENCE.

When you rise in the morning, form a resolution to make the day a happy one to a fellow-creature. It is easily done; a left-off garment to the man who needs it, a kind word to the sorrowful, an encouraging expression to the striving, trifles in themselves light as air, will do it at least for the twenty-four hours. And if you are young, depend upon it, it will tell when you are old; and if you are old, rest assured it will send you gently and happily down the stream of time to eternity. By the most simple arithmetical sum, look at the result. If you send one person, only one, happily through each day, that is 365 in the course of a year. And supposing you live forty years only, after you commence that course, you have made 14,600 persons happy, at all events, for a time.

Great powers and natural gifts do not bring privileges to their possessors so much as they impose duties.

Reading for the Young.

EATING BREAD AND MILK.

BY FLEDA.

The daintiest, prettiest picture
'Twas ever my lot to see
Was one of four beautiful children,
On a door-stone *vis-a-vis*;
With eyes as bright as diamonds,
And hair as soft as silk,
Out of an old-fashioned porringer,
Eating bread and milk.

In the background, near the door,
Sit the father and the mother;
And when the laugh goes 'round,
They glance at one another.
What need is there for speech,
The eye so much hath said,
As they watch the little children
Eating milk and bread.

The housedould pet, old Bounce,
Is sleeping in the clover,
And in his dreams, again
The hunt he's living over;
When'ere the spoons click on the dish
He lifts his shaggy head,
And seems to say, I envy you
Your sweet new milk and bread.

Through the trees, the low sun-shadows
Were shifting here and there,
Lighting up each winsome face
With a beauty almost rare;
While the tired birds came trooping
To their leaf cots over head,
Softly twittering, good night,
To the girls with milk and bread.

What artist-hand can catch
The smile-light coming, going:
Or tint the restless tresses
On the dimpled shoulders flowing;
Or give the arching lip
So fine a shade of red,
As it takes a sip of milk
And then a *bite* of bread?

O, happy little dreamers!
Upon that doorstone step,
No shade of care has crossed
Their sunny paths as yet.—
O, would their lives might ever be
So free from care and dread
As now, while twilight gathers,
Eating milk and bread.

Indus-Wild, Warren Co., Ill.

LETTERS TO YOUNG RURALISTS.—IV.

FROM COUSIN JOHNNIE.

I haven't seen any answers so far to the questions I asked you in my first letter. Now, will you not all try and see if you cannot give some kind of answers? Never mind if you should make mistakes; the way to improve, you know, is to have our mistakes corrected.

I am glad Eva M.'s Black Spanish chickens have such a brave defender from the minks as her mother seems to be. I wonder if they are as tame as a chicken I used to have? My "Tamey" would come running up to me whenever I called her by name, and then sit down and wait for me to take her up in my arms or put her up on my shoulders; and often, if I happened to take no notice of her, she would fly up herself. There she would sit and talk to me in her fashion for any length of time. By-and-by Tamey grew to be a hen, but she was just as tame as ever. I used to think her eggs were something quite superior to those of my other hen, and always kept them in wine glasses entirely separate from the rest. Sometimes while Tamey was on her nest, I would go in and talk to her a little, and she would raise up her head and say—well, perhaps I shan't spell it just right, as I don't know how to spell the hen language, but it sounded like, "ricketty caw—ricketty caw!" After a while Tamey expressed her wish to set, and some eggs were provided for her in a barrel at the barn. But Tamey, notwithstanding I used to spend a great part of each day leaning over the barrel, found it rather duller music than she expected—so whenever she came off she spent so much time in her own enjoyment that some of the eggs got cold; some of them she ate up, and finally, when she did succeed in bringing out two or three miserable little chicks, so selfish had she become from being so petted and spoiled (like some people I have known), that after a few days she entirely deserted them and went round singing as merrily as possible. Whenever Tamey was missing, I was pretty sure of finding her in the coop, where the poultry intended for the table was fattened. The servant girl used to put her up, just to tease me, and enjoyed seeing me march straight to the coop and let her out. Many, and many a time I saved her (to me) precious life; but at last, when I was shut up in one room crying with the toothache, and neither thinking of nor caring for anything else, an order was given for the execution of all the poultry, as we were going to the city to spend the Winter, and in the general slaughter poor Tamey was slain! And I—O, it was dreadful to think of afterwards, I might have saved her but for that toothache! So you see, children, how very important it is to have your aching teeth pulled out!

Nellie M. F., gives us a very nice recipe for ice-cream; but she simply says, "then freeze," without giving any particulars about the freezing, which is the most important part. James S., has given us a very good letter for the first one—a *great deal* better than the first one I ever wrote, about which I shall be obliged, for want of space, to tell you another time.

A BIT OF A LESSON IN NATURAL HISTORY.

BY AUNT PHEBE.

A few weeks ago (in the Rural New-Yorker of Feb. 24th) I told you something about the grand divisions of the Animal Kingdom. And perhaps you will remember that the fourth and most numerous division of the Mammals was *Quadrupeds* (four-footed Mammals). *Quadrupeds* are *Unguiculata*, or clawed, and *Ungulata*, or hoofed. The *Unguiculata* have five orders: 1. Carnivora (flesh-devouring). 2. Insectivora (insect eaters). 3. Rodentia (gnawers). 4. Edentata (toothless). 5. Marsupiata (pouched). The *Ungulata* has two orders: 1. Pachydermata (thick skinned). 2. Ruminantia (cud-chewing).

Now, you are thinking, I dare say, that this is a pretty good place to stop—that we have all the animals in this wide world pretty well divided off. But a little patience, if you please, and we will divide the Carnivora into five families:—1. Felidæ (cat tribe). 2. Canidæ (dogs). 3. Mustelidæ (weasels). 4. Ursidæ (bear). 5. Phocidæ (seal).

Who among our young Ruralists can furnish some examples of the Felidæ? "There is Miss Lilly Snowflake and Mr. Thomas Grimalkin; Mrs. Tabitha Velvet Paws and her family." Yes, I know; but you must remember that although the *Felidæ* is the Cat tribe, it includes a great many other animals, of which the cat is taken as the *type*. I will mention a few of them. If you like puzzles as well as we do, you will rather have the Anagrams, as follows:

Animals of the Family Felidæ.—1. Grite. 2. Nilo. 3. Rod leap. 4. U come. 5. Agu jar. 6. Pat Hern. 7. Cy, lad, unn ux. 8. I munch one.

You will find these very easy, and I hope you will study them out. It may help you to remember the names of some of the *Feline* animals.

[Answers to the above Anagrams will be given in two weeks.—Eds.]

The Puzzler.

ILLUSTRATED REBUS.—No. 15.

☞ Answer in two weeks.

MISCELLANEOUS ENIGMA.—No. 5.

I am composed of eight letters.
My 4, 1, 8, 3 is a boy's nickname.
My 8, 5, 3 is an article.
My 2, 6, 8, 1 is what I never like to be at school.
My 2, 6, 4 is a kind of dog.
My 7, 1, 8 is something worn upon the head.
My 1, 2, 6, 7, 8 is what farmers do.
My 5, 1, 3, 2 is a part of the foot.
My 5, 3, 7 is a fowl.
My 4, 6, 2, 7 is what sick folks generally are.
My 6, 8 is a preposition.
My whole is an animal. H. A. C.

Railroad bridge at Topsham, Me., on the 3d; loss, $30,000.....Johnson's cotton mill at North Adams, Mass., on the 3d; loss, $150,000....Railroad bridge at Dauphin, Pa., on the 3d; loss, $200,000.

Obituaries.

GEN. HUMPHREY MARSHALL died in Louisville on March 29th....The funeral of Mazzini took place at Genoa, on the 27th ult., in the presence of 80,000 people....Peter G. Peck, member of Assembly from the Fifth District of Kings Co., aged 49 ...Wm. Truesdale, ex-Governor of Tennessee....Isaac P. Walker, U. S. Senator from Wisconsin in 1854....The funeral of S. F. B. Morse took place in New York on the 5th inst., and was numerously attended. His death has caused universal mourning in all parts of the world. Gov. Hoffman sent a message to the Legislature in relation to it, and numerous bodies have passed resolutions of respect and condolence.

Political.

A difficulty has arisen between the Government and the Western Union Telegraph, which may lead to the purchase of all the telegraphs by the Government.. The amended charter for New York passed the State Senate on the 29th....The charter of the Southern Improvement Co., has been repealed in Penn .. H. Greeley and others, have issued a call to New York Republicans to attend the Cincinnati Convention....Vice-President Colfax denounces the attempt to divide the Republican party .. Our Government has asked Spain to release Dr. Howard of Cuba .. Judge Davis will not run for President if he fails to receive the Cincinnati nomination....Everybody is invited to attend the Cincinnati Convention. ....Gen. Longstreet is in favor of President Grant....The election in Connecticut on the 1st, went in favor of the Republicans, Jewell gaining a majority over English in 1871....The second note from England on the Alabama Claims, has been received, and the correspondence is considered closed. ...A great deal of matter pertaining to the French arms sale, the N. Y. Custom House, and the Naval investigation, continues to be published, but nothing of moment is brought to light .. The Rhode Island election has gone in favor of the Republicans....Iowa and Kentucky will hold conventions for the Cincinnati Convention....A mass meeting to endorse Gen. Grant, is to be held in Brooklyn. H. B. Claflin heads the call ...The Republicans have carried Montclair, N. J., Leavenworth, Kans., St. Joseph, Mo., and St. Paul, Minn., in local elections....Controller Hurlburd of the Treasury has resigned, evidence being found against him.

FOREIGN NEWS.

From Great Britain.

AN explosion in a coal mine near Bolton, on March 28th, killed 28 men outright.....Lord Neaves has become rector of the University of St. Andrews....Anxiety in relation to the Alabama question continues, and unsettles business. A Republican meeting in Glasgow has been broken up....A great review has taken place at Brighton, which is considered a failure. ...At Lurgan, Ireland, during the races, a stand gave way, and 30 people were injured. Lord Lisgar, Gov.-General of Canada, is to be called home, to be succeeded by the Earl of Dufferin, ...Mr. Disraeli has had a great reception in Manchester....English papers now estimate the Alabama claims at $214,000,000....Mr. Disraeli has made a speech in favor of the monarchy.... "Hole-in-the-Wall," a London tavern, has been refused a license because it was used as headquarters for the Republicans.

From France.

LUTZ, leader of the Paris incendiaries, has been arrested....President Thiers has made a speech, in which he says the army is faithful, internal order will be maintained, and peace is not threatened from abroad....The President will hold receptions in Paris, but will not move the capital to that city.... France will support Amadeus on the throne of Spain....Gen. Trochu's trial has ended with the conviction of the editors of the *Figaro*....Thiers holds England responsible for Russia's infraction of the Treaty of Paris.

SEMI-BUSINESS PARAGRAPHS.

The Canada Southern Railway offers through its Agents, Messrs. LEONARD, SHELDON & FOSTER, No. 10 Wall street, N. Y., the remaining $5,000,000 First Mortgage Sinking Fund 30-year Bonds, bearing interest at seven per cent., principal and interest payable in gold, either in New York, London or Frankfort.

This route is 33 miles shorter than any other between Buffalo and Chicago, and the advantages so great as to induce the following well-known gentlemen, in connection with others, to become largely interested in the enterprise: JOHN F. TRACY, President of the Chicago and Rock Island, the Chicago and North-Western and several other western roads; MILTON COURTRIGHT and WM. L. SCOTT, long connected with the Lake Shore Road; SIDNEY DILLON of the Union Pacific; DANIEL DREW and GEORGE OPDYKE. Two-thirds of the road have already been completed by subscriptions furnished by the above well-known business men. The bonds now offered will complete and fully equip the road, and it is expected that the entire line will be ready for use by the close of the present year, 1872. The wonderful development of the Western States, and the demand for cheaper freights and greater railroad facilities, assure the success of the great lines leading from the seaboard to that portion of the country. So great has been the increase of railroad facilities throughout the Western Country that the lines leading from the East have been crowded beyond their capacity, and the result has been a high rate of tariff, particularly during the season of closed navigation. In addition to the 33 miles saved in distance between Buffalo and Chicago, considerable difference is gained in the running time, as ninety-six per cent of this route is positively straight, and much greater speed obtained than by the old circuitous routes.

The main line is 229 miles long, with branch lines amounting to 61 miles in addition; 220 miles are graded, bridged and ready for the superstructure. The remaining 70 miles are under contract; nearly all the ties are on the ground and 6,500 tons of rails have been delivered and paid for. The branch at St. Clair connects with the many roads leading to the great mineral and lumber region of Michigan, while the main line runs through the oil regions of Canada, and arrangements have been made with numerous roads leading to Chicago to act as feeders to the Canada Southern.

Facts for the Ladies.—Mrs. J. P. MILLARD, New Hamburg, N. Y., has used her Wheeler & Wilson Lock-Stitch Machine since June, 1862, doing the family sewing for six persons, and, making bedding for a steamboat, without a cent for repairs; it now works as well as when first used. See the new Improvements and Woods' Lock-Stitch Ripper.

Transforming the Complexion.—The transformations produced by HAGAN'S MAGNOLIA BALM are quite as astonishing as any scene on the stage of a theatre. That famous beautifier, transmutes a sallow, pecky looking complexion, into one in which the lilly and the rose vie for admiration, and imparts to a dry, harsh skin, the softness of perfect loveliness.

Watch No. 2755—bearing Trade Mark "Fayette Stratton, Marion, N. J."—manufactured by United States Watch Co., (Giles, Wales & Co.,) has been carried by me two months; its total variation from mean time being one second.—JAS. B. WEAVER, with A. S. Barnes & Co., 111 and 113 William street, N. Y.

Few implements that farmers use have been tested and improved for so many years, that they are as near perfect as any thing can be made of wood and iron. The Blanchard Churn is one of this kind.

Poudrette.—The attention of farmers, gardeners and others using fertilizers, is directed to the advertisement of the Double Refined Poudrette of the "Lodi manufacturing Co., New York.

Whenever you have nothing else to do, send for free price list of our $75. four ton hay scale the Jones Scale Works, Binghamton, N. Y.

THE MARKETS.

MONEY AND TRADE AFFAIRS.

NEW YORK, Saturday, April 6, 1872.

SINCE our last report the Secretary of the Treasury has published the First of April Schedule of the Public Debt of the United States, and the Currency Bureau of the department has published the reports of the condition of all the National Banks of the country, as on the 27th of February last.

The Funded (Gold bearing) Debt has been reduced since the first of March, in the large sum of $31,184,350, and the interest reduced on the further sum of $32,000,000 from six per cent. to five per cent. per annum. The reduction in the Principal of the Funded Debt since March 1, 1869, now amounts to $288,880,300, and the reduction in the yearly interest charge (in Gold), $10,293,072. The reduction in Treasury paper, not funded, in the same time has been $26,251,430, and the interest thereon reduced $1,221,000 a year, leaving only $912,000 a year as the whole interest charge on this portion of the debt. The following is the present general summary:

FUNDED (GOLD) STOCKS, UNITED STATES, APRIL 1.

Date.	Coupon.	Registered.	Total.
5-20s, 1862	$454,621,800	$34,055,700	$488,680,500
5-20s, 1864	40,211,300	39,316,400	79,528,300
5-20s, 1865	120,196,700	42,619,450	162,788,150
5-20s, 1865, (new)	165,511,550	63,660,350	229,171,900
5-20s, 1867	228,853,200	92,140,800	320,993,000
5-20s, 1868	26,723,500	12,942,500	39,666,000
Total 5-20s	$835,706,650	$285,013,700	$1,120,917,350
Sixes, 1881	91,594,300	192,267,000	283,861,300
Fives, 10-40s	55,276,250	138,230,450	194,507,300
Fives, 1874	13,355,000	6,645,000	20,000,000
New Fives, 1881	70,788,800	129,211,200	200,000,000
Total	$1,067,118,500	$741,847,350	$1,818,965,850
Total March 4, 1869			2,107,846,150
Reduction of Funded Debt			$288,880,300
Yearly Gold Interest charge, 1869			124,255,350
Present yearly charge			104,962,278
Reduction Interest Charge			$19,293,072
Reduction in Funded debt as above			$288,800,300
Reduction of Treasury Circulation			*26,251,430
Total payments on Debt			$315,151,730

* This item stood $41,953,512 on the first of March.

STATEMENT.—During the month the Treasury Circulation was increased $15,702,382 by bonds called in for redemption and upon which interest has ceased, but which have not yet been presented for the Gold. Deducting this from the decrease in Funded Debt since March 1, the net reduction of all debt in March, out of the accruing surplus revenues is $15,451,968.

The Spring trade continues active and generally satisfactory. Speculation in Wall street also continues active, but the excitement is not quite so high as through the previous fortnight. Money is stringent to the brokers and not very easy to the merchants, but the former pay the extra rates as one of the attendant drawbacks or charges upon the current speculation in the railroads and other stocks.

PRICE OF STOCKS AND BONDS.

American Gold	110⅝	N. Y. Central Scrip	93
U. S. 5-20's of 1867	113	Reading	115½
U. S. 6s of 1881	115⅝	Rock Island	116
U. S. 10-40s, 5 ₰ cts	106⅝	N. West	82½
U. S. New Loan	110⅝	Do. Preferred	94
N. Y. Bounty Loan	107⅝	St. Paul	82
Tennessees	66½	Do. Preferred	81
Virginias, new	56	Lake Shore	103⅝
Missouri Bonds	90	Ohio and Mississippi	40
U. S. Currency 6s	115½	Toledo & Wabash	79½
Central Pacifics	101½	Erie	62½
Union do	92	Union Pacific Stock	38⅝
Western Telegraph	74½	Adams Express	97½
Pacific Mail	63½	American Express	73
N. Y. Central Stock	96⅛	United States Exp's	71

Although the fluctuations in the railway speculation during the week were quite considerable, some of the prices going up, the closing figures show no great differences from our previous table. Erie is 4 per cent. higher.

PRODUCE AND PROVISIONS.

NEW YORK, Friday, April 5, 1872.

Receipts.—The receipts of the principal kinds of produce since our last embrace 7,712 bales of cotton, 2,911 bales; dried fruits, 9 pkgs.; eggs, 14,513 bbls.; flour, 33,317 bbl.; wheat, 10,900 bu.; corn, 224,200 do.; oats, 87,585 do.; barley, 67,100 do.; grass seed, 8,262 bags; beans, 840 bbls.; corn meal, 5,011 do.; do., 1,440 bags; hops, 512 bales; pork, 2,866 pkgs.; beef, 75 do.; cut meats, 8,001 do.; lard, 11,930 do.; lard, 1,470 kegs; butter, 6,575 pkgs.; cheese, 2,260 do.; peanuts, 2,530 bush.; 1,210 hhds. tobacco; 6,266 boxes do.; 3,840 bbls. whisky, 747 bales wool.

Butter.—There is less animation in the butter trade. Old is unchanged when in good order; new must be prime to bring the range given.

State dairies, fine, 33@35c.; State dairies, fair to good, 29@32c.; State, half-tubs, good to fine, 36@38c.; State, do., common to fair, 28@32c.; State, firkins, fine yellow, 31@33c.; State Welsh, good dairies, 31@33c.; State do., common to fair, 25@30c.; State do., fresh made, 35@37c.; State, fancy select tubs, 38@43c.; rolls, good Western, 22@25c.; common to fair, 12@18c.; grease butter, 9½@10c. New State, including pails, 35@38c. Western ranges 20@30c. Some common State runs as low as 25c.

Beans and Peas.—The stocks of beans both here and in the interior are well controlled and with an urgent demand, prices have been forced up 5@10c. per bushel. Prime mediums sell at $2.85@$2.90; fair do. at $2.65@$2.80, Pea $3@$3.25: Kidney, $3.25@$3.40; Red do., $2.25@2.60, Prime Marrowfats, $3.05@$3.15; fair lots at $2.85@$2.95. Green Peas are higher, sales at $2 for prime. Canada, free in bbls., $1.25. Southern, b. e., 2 bush. bag, $2.65.

Beeswax—Has been advanced to 40c. for Southern; with a light stock.

Cheese.—Holders begin to get a little anxious as they find the stock go off less freely than expected. Small lots of fine factory will bring 18½@19c., but would be difficult to place a full line at these prices. Good lots, 17c.@18c. Dairy at 16c.@18c. for good. Vermont factory, 16c.@18c. Ohio factory, 15½c.@17½.

Cotton.—The market is weak, mainly owing to foreign advices. The offerings for the week are moderate.

	Uplands.	Alabama.	N. Orleans.	Texas.
Ordinary	20⅜	20⅜	21	21¼
Good Ordinary	22⅝	22¼	22½	22⅝
Low Middling	22¾	23	23¼	23½
Middling	23¼	23⅜	23½	24⅛
Good Middling	24⅛	24⅜	24½	24⅝

For forward delivery latest sales on the basis of low middling are as follows:—May, 23⅜c.; June, 23⅝c.; Aug., 23½c.; Sept., 21½c.; Oct., 20c.

Dried Fruits.—A few speculators have got control of stock of apples, and prices have been advanced. The sales are moderate, and confined to the home trade. Other fruits very dull.

Apples—Old State, qrs., 8@9c.; Western, new, 10@11c.; Southern, new, qrs., 8½@9¼c.; do. fine, sliced, 12½@13½c.; new State qrs., 10½@11½c.; do. sliced, fine, 13½@15c. Peaches, peeled, new N. C., 17c.; do. Geo., 15@16½c.; peeled E. Sh. Va., 15@16½c.; new unpeeled halves, 7½@8c.; do. quarters, 6c. Plums, 25@27c. Cherries, new, ₰ lb., 30@31c. Blackberries, 13@13½c. Raspberries 31@32c.

Eggs.—The arrivals are not more than sufficient to meet the demand. Sales at 22c for Westerns, 22½@23c. for lots from new points, and 21 for Northern. It is thought these prices will hardly be maintained after this week.

Flour.—Good grades of State and Western are scarce. The general market is firmer, with more inquiry from exporters.

The quotations are at $6.35@6.70 for superfine State; $6.80@7.00 for common extra do.; $7.05@7.15 for good to choice do.; $7.20@7.50 for fancy do.; $6.35@6.70 for superfine Michigan, Indiana, Ohio, Iowa, &c.; $6.75@7.00 for extra do.; $7.05@7.75 for choice extra do., including shipping brands of round hoop Ohio at $7.00@7.25, and trade brands of do. at $7.30@8.10; good to choice white wheat extras at $7.80@8.50; Minnesota, fair to very choice extra, at $7.25@8.55; St. Louis at $7.10@7.75 for common to fair extra, and $7.80@9.65 for good to choice. Southern at $7.25@7.50 for extras and $7.50@10.25 for good to choice. Rye at $4.10@5.05.

Fresh Fruits.—Russets now comprise the chief offering of apples. Cranberries scarce and firm. Nuts are quiet. A few Louisiana oranges quotable $12@13 per bbl.

Apples, good, barrels, $4@4.50; do. selections, $5@5.50 do. poor, $2.75@3; cranberries, fine, bbl., $14.00; do. crates, fine, $5.50; do. do. common, $3@4; peanuts, Wilmington, bush., $2@2.25; Virginia, new, $2@2.20; do. common, $1.25@1.50; hickory nuts, $1.75@2; Pecan nuts, ₰. 8@9c.

Grain.—Shippers are working in wheat more freely, and the market is stronger. Spring grades show the most improvement. No. 2 spring in store at $1.50@1.53; No. 1 in store at $1.58@1.60; winter red Western at $1.70@$1.75; amber Western at $1.76@$1.80; and white Western at $1.78@$1.81. Rye quiet at 88½c. for Western. Oats are weak at 53c.@55c. for Western in store; 51½c.@55c. for white Ohio. Barley is coming in freely and prices are more in the buyer's favor. Sales at $1@$1.02½ for upper Lake Canada. State malt sold at 65c. for unsound. Corn is in good export demand and more stock could be used; sales at 72½c. @73 for Western mixed, afloat, 72½c. for Southern yellow; 71c. for Western yellow in store; 71c. for old Western mixed in store.

Hops.—The business is very light. Choice stock is very scarce and brings full prices easily. The offerings of the poor grades are moderate. Prices are unchanged.

New Yorks, growth 1871, 25@65c.; Eastern do. 1871, 25@60c.; Western do. 1871, 25@60c.; yearlings do. 1870, 10@30c.; olds do. 1869, 10@15c.; old olds do. 1868, 8@12c.; Californians do. 1870, 15@25c.; Californians do. 1869, 9@15c.; Bavarians, 65@75c.; English, 60@65c.; Belgians (nominal), 50@55c.

Hay and Straw.—Shippers have been buying bay freely, and the increased arrivals consequent upon the opening of river navigation are barely sufficient to meet the demands. Shipping, $1.35; retail lots, $1.30@1.75. Straw at $1.05@1.10 for long rye; 85@95c. for short rye; 75@85c. for oat; 50@70c. for wheat.

Poultry and Game.—The demand has become very light. We quote:

Turkeys, good, 24@26c.; Ducks, Western, 25@28c. Fowls and Chickens—Western and State, 20@22c.; do. Bucks Co. and N. J., 25@26c.; capons, 33@36c. Live, State and N. J., 18@20c. do. Western, 17@18c.; roosters, 11@12c.; ducks, per pair, $1@1.12. Geese—Western, $1.75@2; do. Canada, $1.75@2; do. Jersey, $2.75@3.25; turkeys, 20@22c.

GAME.—Canvas backs 75@$1, red head 60@75c., mallard 40@50c., widgeon and teal 40@50c.; black duck, 75c.; English snipe per doz., $2.75@3; wild geese each $1.; wild pigeons, per doz., $2.10@2.25 picked.

Provisions.—Pork closed firm with more favorable advices from the West. Mess, $13; prime mess, $12.25@12.50. Sales of mess for May at $13. Dressed hogs at 6@6¾c. for city. Middles are in moderate demand from shippers, at 6¾c. for short rib, 7c. for long clear, 7¼c. for short clear. Cut meats are selling at 8½@9½c. for hams in pickle, 8½@9c. for do. in salt, 5@5½c. for shoulders. Smoked meats at 10@12c. for hams, 6½@7c. for shoulders, 7¾@8¾c. for clear rib. Lard is strong, at 8¾c. for Western steam, on spot, 9c. for May, 9¾c. for June, 9¾c. for July; city at 8½c. for steam. Stearine quiet, at 9½@9¾c. for prime. Beef very dull, at $8@9.50 for plain Western mess, $10@12 for extra mess; beef hams at 23@27; tierce beef at $15@17 for prime mess, and $19@21c. for India mess Tallow is offered freely at 8¾@9c. for good and prime

Seed.—Clover is coming in slowly, and there is sufficient home trade to keep prices on a steady basis. Sales at 9@9½c. for Ohio; and 9¾@10c. for Indiana Timothy is selling freely at $3@3.50 for common to choice.

Tobacco.—There has been a good business in both Kentucky and Seedleaf mainly to shippers, and advanced prices are ruling. Our quotions are for new crop Kentucky: Lugs, 8@9¾c.; common to medium leaf, 9@10¾c.; fine do., 11½@13c.; selections, 15@16c. New crop Seedleaf, running lots for N. Y., 8½@10c.; for medium Penn., 12½@14c.; fair do., 15@16½c.; fine do., 17@21½c.; Ohio running lots, 10@14½c.; Wisconsin and Western, 8½@9c.

Vegetables.—There is an easier feeling in potatoes with the promise to sell. Onions are firmer.

Potatoes, Early Rose, bbl., $2.00@2.50; P. Blows, $2.25@2.50; Prince Albert, $1.75@2; Monitor and Goodrich, $1.25@1.50; Jackson, $1.50@1.75; Dyright, $1.50@2; sweet Del., $3.75@4.00. Onions, red and yellow, $2.25@2.50; white, $3.00; Conn., 100 strings, $3. Garlic, per 100 bunches, $22@24. Turnips, Russia, bbl., $2. Cabbages, per 100, $6@8. Hubbard squash, per bbl., $5; marrow, $5, Beets per 100, $1.25. Carrots per 100, $1.50.

Wool.—The stock is almost entirely of California and foreign descriptions. The few lots of fleeces on sale are held at full prices, manufacturers buying only as they have occasion to use.

Whisky—Is quiet, at 88c. for Western.

LIVE STOCK MARKETS.

NEW YORK, April 4, 1872.

THE past has been a disastrous week for shippers of live stock. The heavy supply of cattle last week fur-

nished overstocked beef markets, while veal was fairly poured in, and the supply of mutton increased. In addition to these, the shad season may be said to have opened. Dealers have been forced to sell cattle, sheep and hogs at just about what they cost in Illinois, thus sinking the freight, besides losing the commission.

Beeves.—The highest point was reached at the close of our market one week ago. N. Morris, Chicago, threw 140 car loads upon the market last Monday, making 185 cars at Communipaw, with 90 at 100th St., and 28 at Weehawken, thus furnishing 4,941 beeves for one day. The supply of A No. 1 cattle was not large, and 13½c. was obtained, with a few choice at 14c., but below the first pick, prices fell off ½c. per lb.; on inferior lots there was a decline of ½c. per lb. During the past two days we have had about 1,600 fresh cattle. The dead-meat markets are very much depressed, owing to the large amount of beef from the heavy stock of cattle one week ago. An idea of the present state of trade is shown by a few of to-day's sales—viz.: 12 extra fine 9 cwt., Ill. grades, at 13c.; 257 fair to good, 7 cwt., 11½@13c.; a car 6¾ cwt., $71 each; 95 of 7 cwt., 11½c., 57 lbs. per cwt. Some still-fed bulls would not bring 4½c. ₱ lb., live weight. Quite a good many cattle go over until to-morrow.

The following are the closing prices for the week in comparison with what cattle brought one week ago, for net weight of beef:

	This week. Cents.	Last week. Cents.
Choice beeves, ₱ lb	13 @ 13¾	13¾ @ 14
Good to prime	12 @ 12¾	12¾ @ 13
Ordinary to medium	11½ @ 11¾	11¾ @ 12
Lowest grade	10¾ @ 11	10¾ @ 11
Average sales	11½ @ 11¾	12 @ —

Milch Cows.—An improvement one week is pretty sure to be followed by a hard market the next. The great trouble just now is the abundance of milk selling down to $1.70 per can. This is calculated to make a dull market for fresh cows. Poor animals sell the hardest of any time during the season. The best offer for a whole pen of such was $80 each, the owner holding them for $85. It is useless to send common cows here for sale. Fair milkers are worth $50@55, with good to prime at $60@70 each.

Veal Calves.—Large increase in live, and very heavy receipts of dressed calves. The high prices of beef a week ago turned the trade upon veal to a large extent. Prices are lower, the best live selling at 9½c., save now and then something very fine at 10c. Two cars prime calves, 140 lbs., were just sold at 9c. Thin run down to 6@7c., some selling at 5c. Hog-dressed sell largely at 8@9c., the extremes being 6@13c., though very few go over 12½c.

Sheep and Lambs.—The extreme dullness in the wool market has a great effect upon the sale of sheep. We call sheep ½@¾c. lower or at 7½@10c., only something extra fine reaching 10½c. Good lots sell at 9c. Lambs still command 15@18c., being scarce and in fair demand. They are generally sold by the head at 7@8½c. each, a few reaching 9c. Some of the latest sales of sheep were a car, coarse Ind., 99 lbs., at 8½c.; 2 cars, Ill., 101 lbs., $8.68½ per cwt.; 3 cars, 93 lbs., 9c.; 1 car choice fine wool, O., 110. The average of 7,425 sold last week was $9.11, with 1,555 at $9.29 each.

Hogs.—Trade continues depressed at about the rates of the previous week. City dressed are quoted at 5¾@6¾c.; those of 180@200 lbs. selling at 6¾@6¾c.

SPECIAL NOTICES.

RUPTURE CAN BE CURED

without suffering. ELASTIC TRUSSES are superseding all others. Before buying Metal Trusses or Supporters, send for a descriptive circular to the ELASTIC TRUSS CO., No. 683 Broadway, New York.

FOR MOTH PATCHES, FRECKLES

and TAN, use PERRY'S MOTH and FRECKLE LOTION. The well known and reliable remedy for Brown Discoloration of the Face. Prepared by Dr. B.C. PERRY, Dermatologist, 49 Bond street, New York. Sold by *Druggists*.

While Waiting for a Cough "to go as it came" you are often sowing the seeds of Consumption. Better try at once Dr. Jayne's Expectorant, a sure cure for all Coughs and Colds.

Send Fifty Cents to Dr. TATE POWELL, Beattie's Ford, N. C., for sample of Japan Clover Seed (*Lespedeza striata*).

THE

CANADA SOUTHERN

RAILWAY COMPANY

Are now offering through the undersigned the

Remaining $5,000,000

OF THEIR

FIRST MORTGAGE SINKING FUND 30 YEARS

7 PER CENT. GOLD BONDS

AT

90 and Accrued Interest.

THE ROAD runs from Buffalo to the Detroit River, connecting there with the Chicago and Canada Southern, now being built to Chicago, and will thereby form the

SHORTEST TRUNK LINE BETWEEN BUFFALO AND CHICAGO, or, in other words, will be the SHORTEST LINK IN THE GREAT LINE OF TRAFFIC BETWEEN THE EAST AND WEST, connecting the GREAT SYSTEM OF RAILWAYS which diverges from Buffalo, Toledo and Chicago.

A branch also runs from St. Thomas to St. Clair, where it forms connections with the various roads leading into the lumber and mineral regions of Michigan.

THE MAIN LINE from Buffalo to the Detroit River is 229 miles long. The branch from St. Thomas to St. Clair is 61 miles, and runs through the great Canada oil region.

OF THE entire line (290 miles) *Two hundred and twenty* miles are *graded, bridged and ready for the superstructure*. The remaining 70 miles are under contract to be ready for the superstructure early in the summer.

OF THE $30,000 ties required, 200,000 are on hand and the remainder are coming in daily.

SIX THOUSAND FIVE HUNDRED TONS of rails are delivered and paid for, and the balance contracted to be delivered early in the summer, those for the main line being STEEL, all 60 lb. to the yard.

ALL the materials for the stations, and a part of the equipment are purchased.

TRACK-LAYING will be begun as soon as the frost is out of the ground.

The entire line will be ready for business on or before Dec. 31, 1872.

THE ROAD is being built by the most experienced railroad men in the country, who are confident of a profitable business for it from the day of its opening.

THE ROAD will be

33 Miles Shorter than any other Road,

either BUILT or in contemplation between Buffalo and Chicago.

THE MAXIMUM GRADE on the entire line does not exceed FIFTEEN FEET to the mile—and Ninety-six per cent. of the road IS STRAIGHT.

The Canada Southern (including its branch of 61 miles to St. Clair) and the Chicago and Canada Southern, with their light grades, direct alignment, being the shortest route between Buffalo and Chicago, will admit of the most speedy, economical and safe transit attainable for both passengers and freight.

The road thus far has been built by cash subscriptions, and the proceeds of the bonds now offered will complete and fully equip it. The principal and interest of the bonds are payable either in New York, London or Frankfort.

We have no hesitation in recommending the bonds AS A PERFECTLY SAFE as well as a PROFITABLE INVESTMENT.

WEBSTER'S PATENT

BUTTON-HOLE WORKER.

Patented June 27, 1871.

One of the most important inventions of the age! The most perfect Button-Hole Worker ever invented!

So simple that a child can work a more perfect button-hole with it than the most experienced hand can work without it. Every stitch is taken with the most perfect mechanical accuracy. Is used entirely independent of the sewing machine, and will last a life-time. Does away with pricking the fingers, straining the eyes, and with imperfect and irregular worked button-holes. They give universal satisfaction. Ladies who use them say that they are worth their weight in gold. Over 11,000 sold during the first week of their introduction. The most liberal inducements offered to the trade. Dry Goods and Fancy Goods Merchants find it an excellent selling article. Local and travelling agents wanted everywhere.

Samples and terms, with full directions for use, sent prepaid on receipt of 50 cents. Orders by mail receive prompt attention. Address

Paints, Oils, Blacking, &c.

ARE YOU GOING TO PAINT?

MORE THAN

100,000 HOUSES

HAVE BEEN PAINTED WITH THE

AVERILL CHEMICAL PAINT

IT IS THE BEST

In the world for exterior work upon Cottages, Villas or Buildings of any kind, whether built of brick, wood or iron. It is a liquid, *ready for use*, and requires no oil thinning or drier. Purest white, and any desired shade can be had in packages from one gallon upwards.

EXTRACTS FROM OUR LETTERS:

CHAS. HALLETT, Esq., of Riverhead, L. I.:—"Years ago I had your paint applied by the side of the best white lead. The lead requires repainting, but the Averill Chemical is yet looking well."

Gen. DAVID H. STROTHERS:—"Your Paint fulfils your representations."

Rev. S. C. ALEXANDER:—"Our Institute has saved $150 by using your Paint. It is splendid."

PETER HENDERSON, Esq.:—"I find the Chemical Paint retains the colors and gloss far superior to that done by the lead and oil at the same time."

Gen. JAS. NEGLEY, M. C.:—"I find it the cheapest and best."

SETH THOMAS, Esq.:—"It gives better satisfaction than any paint I ever used."

Sample card of beautiful colors, and recommendations from owners of the finest residences in the country, furnished free by the AVERILL CHEMICAL PAINT CO., 32 Burling Slip, New York, or 118 Superior St., Cleveland, Ohio.

P. S.—The superiority of these Paints has already brought numerous *worthless* imitations in the market. We caution the public against using them.

The Season for Painting

HAS COME AGAIN.

631 Market St., Philadelphia, Pa.

CARHART'S
PATENT TWO-HORSE
Pulverizing Cultivator

Was Awarded the First Premium at State and County Fairs in 1870 and '71.

It is superior to the best Wheel Cultivator.
The price is only Twenty Dollars.
The draft is reduced nearly one-half.
The depth you wish it to run is regulated without the use of wheels.
It can be drawn close to a tree or plant without injuring it.
It is not disturbed by short undulations of earth, like the Wheel Cultivator, but pulverizes, levels and fits the ground for the Mowing Machine better than any Cultivator in use, and can be used for more purposes than any other implement on the farm.

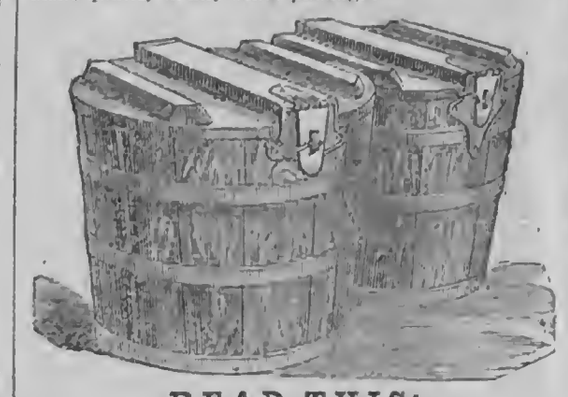
FARMERS, DAIRYMEN AND BUTTER BUYERS!

PACK YOUR BUTTER

IN

WESTCOTT'S
RETURN BUTTER PAIL

Approved and recommended by the leading authorities of our country on dairying, and acknowledged by all butter dealers to be the very best package in use. Butter packed in this Pail brings **5 to 10 cents** more a pound in the New York City market than the same quality in any other package.



READ THIS:

NEW YORK, Nov. 15, 1871.

We, the undersigned, Produce Commission Merchants of the City of New York, consider Westcott's Return Butter Pail, manufactured by Silsby Bros., Belmont, N. Y., *the best package in the market*. It is our experience that Butter packed in this Pail *sells more readily and commands a higher price* in this market than in any other package, and we heartily recommends its general use by the dealers, dairymen and butter buyers who ship to this city.

Respectfully,

(Signed by 45 leading Commission Merchants.)

The Westcott Return Butter Pail meets my approval as a good butter package. It is one which I always feel safe in recommending.

X. A. WILLARD,
Dairy Editor Moore's Rural New-Yorker.

Dairymen, send for a Circular! Dealers, send for a Price List! We are the sole manufacturers of **Westcott's Return Butter Pail,** and also manufacture very extensively Butter Firkins, Half-Firkin Tubs, 25-pound Butter Pails, Well Buckets, &c., &c.

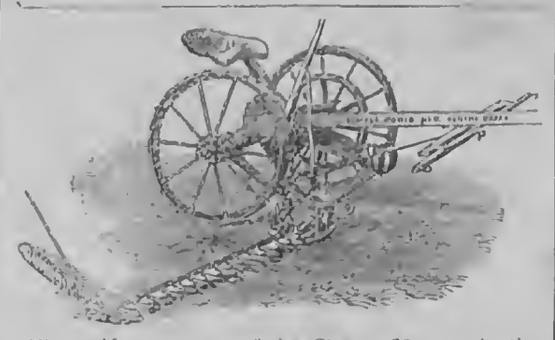
AMES PLOW CO.,
No. 53 Beekman Street, New York.



The *uniform success* of the Clipper Mowers in the field, the testimony of every farmer who has used them, that they are the *lightest in draft*, the *most durable* and the *most economical* machine for the farmer to buy, fully substantiates what the proprietors have always claimed—that the Clipper is the **Best Mower in the World.**

To the No. 4 size is attached the Dropper (cutting 5½ feet, with *separate Finger-Bar* for reaping), constructed with great improvements—in fact perfected; and in point of efficiency, strength, lightness of draft and symmetry of proportions, it is, as a Reaper, also unequaled. Farmers! see it before you buy. Pass your own judgment upon it. Look at its many improvements possessed by no other machine. Remember, it is fully warranted. Send for Pamphlet.

"FAMILY FAVORITE!"

THE

WEED. WEED

The most perfect, reliable and generally useful machine in existence. For the family of the farmer or mechanic, where the work required of a sewing machine ranges from the heaviest garments of men's wear to the most delicate and ornamental fabrics for ladies and children, it has proved itself thoroughly efficient and entirely satisfactory. Of unequaled simplicity and completness of construction, capable of being learned and operated with one-fourth the usual expenditure of time and labor, with a capacity for quantity, quality and variety of execution beyond its competitors, and a reputation for durability and reliability known and appreciated by thousands, it is offered to the people for the most critical inspection and comparison, with confidence that its obvious merits cannot fail to convince the careful examiner of its superiority. Manufactured by the

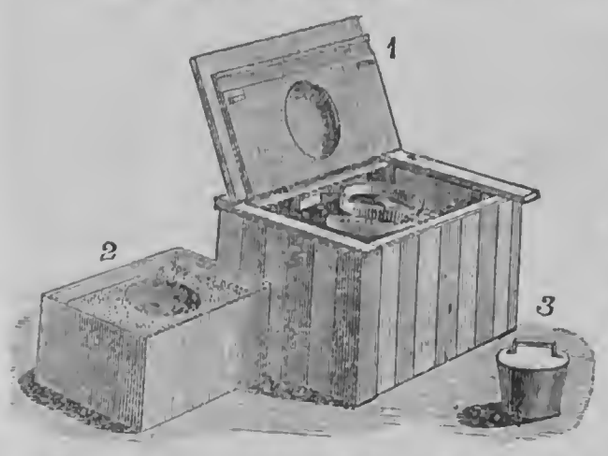
PUBLIC HEALTH PROMOTED! AGRICULTURE BENEFITED!

GOUX'S

PATENT ABSORBENT CLOSET & URINAL.



"The Goux system possesses all the advantages of the dry earth system without its disadvantages; it is economical, deodorizing and self-acting. The whole refuse of every house, as excreta, liquid or solid, ashes and sweepings, are disposed of and turned to account, and it is applicable in individual cases, dwellings, and in large communities. The alterations to the ordinary closets, to adapt them to the dry system, are less costly in the Goux process than in any other, and it is applicable to the best description of houses, as well as to the dwellings of the poor."—*Scientific American, Jan. 1, 1872.*

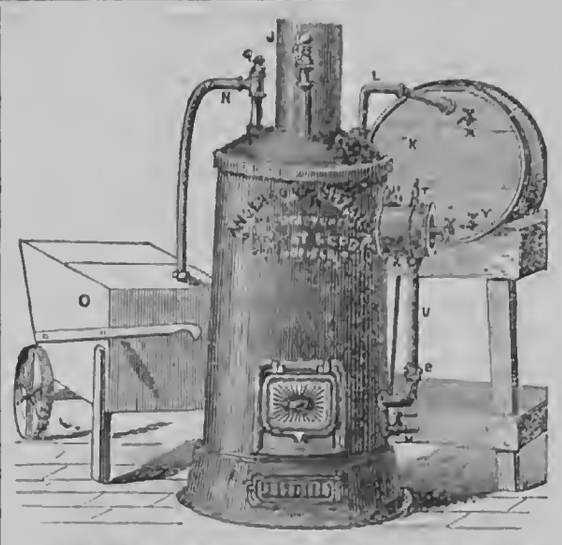
JACOB GRAVES & CO., No. 26 North Market St., Boston, Mass.



ANDERSON'S AGRICULTURAL STEAMER, for *Steaming* FEED for STOCK Heating Cheese Vats; Tannery Vats, Conservatories, &c. This Steamer is made of Wrought Iron, thoroughly riveted and finished in good style. It has a reliable Automatic or Self-regulating Water Feeder, Safety Valve, Vacuum Valve, Water Gauge Cocks, Whistle, &c., all complete. The boiler is peculiar in construction, being ONE COMPLETE DOUBLE BOILER WITHIN ANOTHER, the two communicating one with the other. It has an extraordinary amount of fire space for the size of the boiler; No. 3, a medium size, having 3,853 square inches of fire surface; consequently, it requires but little fuel to run it. Either wood or coal may be used for fuel.

It will cook more feed, or heat more water, in a given time, than any other Steamer of the same size or cost. It is more durable than any other, for the reason that the fire-box is made of wrought iron, and is *entirely surrounded with water.* We are also manufacturing:

Anderson's Low Pressure Steam Heater, for Heating *Private Dwellings, Stores, Churches, Conservatories, &c.* We manufacture for all the territory east of Illinois.

For further particulars address

TO FARMERS.—DOUBLE REFINED POUDRETTE of the "LODI MANUFACTURING CO." for sale in lots to suit customers. This article is sold for *half the price* of other fertilizers, and is cheaper for tobacco, cotton, corn and vegetables than any other in market. It is made entirely from the night soil, offal, &c., of New York city. Price, delivered on board in New York city, Twenty-five Dollars per ton. I ask attention to the following Testimonials:

ONEIDA Co., N. Y., Oct. 12th, 1871.—*Dear Sir:* For two years past I have used the Double Refined Poudrette for corn, potatoes and garden Vegetables, and I have realized on the first crop 100 per cent. for all the money invested. Yours truly, T. B. ALLANSON.

WINDHAM Co., Vt., Dec. 4th, 1871.—*Dear Sir:* I think the Lodi Company's Double Refined Poudrette the best manure I can find for tobacco, corn and potatoes. I shall order a number of tons another season. Yours respectfully, E. S. HORTON.

JESSE VAUGHN of Lancaster, N. Y., under date of September 20th, says:—I applied the Double Refined Poudrette, last Spring, on corn and potatoes, and I believe I have the best corn in town, and my potatoes are an excellent crop. I have used your Double Refined Poudrette several times before, and always with good results, but this year the effect has been more perceptible than ever before.
